BUILDING COSTS IN 1926

The year 1926, despite the General Strike, was not one in which the prices of building materials and rates of wages showed great fluctuations. The General Strike certainly had an effect, but not so potent a one as might have been anticipated. The prolonged coal stoppage (and the threat of a trade stoppage in the early months of the year) resulted in the conservation of money which might otherwise have been spent on building; the economic result being that the demand for building materials, having slackened at the beginning of the year, there was little encouragement for or hope of higher prices. The Building Trade, however, made a fairly good recovery from these industrial troubles, and we may convince ourselves that the apparently growing boom in the Iron and Steel Trades will reflect some of its glory on the Building Trade.

A considerable increase in business would not, at the moment, necessarily mean an increase in prices. The available supply of building materials at the present time is quite equal to coping with increased demands, and we can, therefore, reasonably anticipate that prices will remain on a fairly stable level. A factor which will militate against any big increase in prices is an apparent falling off in housing generally. Extensive new schemes by local authorities are not so plentiful as they were two years ago, and opinion in some quarters leans towards a reduction in or entire disappearance of the subsidy, if there is a heavy deficit on the current year's Budget.

The speculative builder has slowed down recently and, while there is a probability that this feeling will continue for a little while, increased prosperity in the Country generally should convince him that there is still a market for the well-built moderate-sized house. It must be admitted, however, that in some districts it is becoming increasingly difficult to dispose of newly-built houses. The feeling is not general, but there is no doubt that, in many London suburbs and in the Provinces, house property is on

the decline and prices are not ruling as high as they were a year ago. From one point of view, of course, this is all to the good, there being many thousands of people who, for various reasons, do not wish to purchase the house in which they live, preferring to rent. Houses "to let" would be the natural outcome of a further fall in the cost of house construction.

So far as labour is concerned, wages do not show any reduction during the past year, but there have been some small increases. It is most gratifying to note that Labour's output generally is improving, thus helping materially in maintaining stability of building costs. In Liverpool there was an increase of wages in all trades in the early part of the year, and Manchester showed an increase in Plasterers' rates of pay. The former may be regarded as practically permanent, as Liverpool has always claimed outstanding rates; but the Manchester increase is most probably due to the shortage of labour in the Plastering trade throughout the Country, and will undoubtedly adjust itself as the balance in that trade becomes more even.

Amongst building materials it cannot be said that there were any great increases or reductions. Apart from timber, materials are not carried on stock in large quantities by the average building contractor, cost of storage space and handling charges forbidding such a course. Few important trades work on such hand-to-mouth principles as the Building Trade, and one big result of this is that manufacturers endeavour to keep pace, more or less successfully, with the demand. This practice or custom tends to keep prices at a level which is only disturbed by excessive demand in the Trade. A factor which has assisted considerably in post-War years in stabilising prices, and preventing rapid increases in the cost of any particular article, is the facility which both the architect and the builder have shown in devising alternative methods of

construction at the slightest sign of famine in any branch of building material supplies.

Importation of foreign bricks has shown a falling off, possibly on account of relatively poor quality, but, more probably, due to the increased availability of the home-produced article. In the early part of the year British bricks were rather scarce. Imported tiles, however, seem to hold their own, with perhaps a slight increase in popularity; and prices in both these materials have shown little alteration throughout the past year. So far as cement is concerned, there has been practically no alteration in price throughout the year; but the foreign product was less in evidence, excepting during the latter part of the coal stoppage. Castings were at one period almost unobtainable, but no such great increase in price has resulted as might have been anticipated. The present high cost of coal will undoubtedly continue to affect this trade considerably more than others. Stone for masonry remains probably the most stable in price of all the building materials in general use.

Timber has shown a fall during the year particularly in the northern Counties where, during the Summer, over-importation produced something of a glut at an inopportune time, and some of the lower grades were almost given away to save dock charges. The demand for hard woods, however, remains steady with possibly a slight increase, but showing little alteration in price during the latter part of the year. The importation of Australian timbers has not yet had any vital effect upon the Market, although the demand for these and other Empire-grown timber shows an increase.

Lead does not seem to have fluctuated so much as in past years—probably due to a fairly consistent demand with ample supplies.

Amongst "finishings" there seems to have been a general reduction which, though small, is none the less welcome, and we feel quite safe in predicting still further reductions. Competition is now so keen between Home and Foreign productions that prices cannot soar. Empire-produced composition and plaster boards are still well to the fore and the cost of freight and handling remains sufficiently low to keep selling prices in this country at a reasonable level. Painters' and decorators' goods have shown slight reductions during the year 1926. These are mainly manufactured from imported raw materials which were available throughout the year in normal quantities and at somewhat easier prices.

Generally speaking, orders do not seem to have been so evenly distributed throughout the building material trades as usual. We have heard of works in one particular trade running to considerable overtime, while others, in the same trade, within a reasonable radius, have not had sufficient work in hand to keep normal staffs employed. This again is a factor which has helped to keep prices down. Taking all things into consideration, the year 1926 has not been one over which the Building Trade has much ground upon self-congratulation, but there is considerable evidence of a more optimistic feeling in the near future. We feel confident, therefore, that the year upon which we are now embarking, although it may not be equal to those which immediately followed the War, will certainly show a huge improvement upon 1926.

Notes and Comments

Westminster and Housing

Since our note on this subject last week, the Vice-Chairman of the Housing Committee of the Westminster City Council and his critic, Canon Woodward, have had a further interchange of views in the columns of *The Times*. The Vice-Chairman disclaims any attempt, by his previous letter, to establish a principle that each London borough is responsible only for the housing of those who actually work within its borders. In the case of Westminster, that would be naturally impossible if there were to be any places left for people to work at. He agrees, however, that it is necessary to house the working-class population whose services are required for the vast community that come into Westminster daily to their work; and he claims that but for the influx of working people from other districts, there would be ample accommodation for those who must necessarily live near their work in that City. What he maintains is that it is an extravagant suggestion that, in such a valuable and highly assessed area, provision should be made for a surplus working-class population from other boroughs, whose places of occupation are so situated that they might be housed quite as conveniently in far cheaper localities. Canon Woodward agrees on the impossibility of Westminster housing all those who work there; but he deduces from Mr. Schomburg's latest reply a desire to create an enclave for the well-to-do together with such working-class people as may be required for the service of such a community. This is an arguable policy; but such a segregation of the classes he has always understood to be regarded by students of

social problems as one of the most unfortunate social phenomena of recent times. Both the reverend gentlemen seem to us to be in the right, but it is probable that economic factors will settle the matter, and that, in a way, contemplated by neither of them.

Oxford's Future

The City Council of Oxford will meet in three days' time to make a momentous decision about the future development of its district, as it has to consider whether it will permit the South Parks land to be built upon, or whether, as an alternative, this area shall be sterilised and the offer of a hundred acres of land near Marston be accepted for an independent model village. The latter scheme, advanced by a number of people interested in preserving the amenities of Oxford, is part of a general proposal to provide for future expansion by creating a number of small townships on the hills around, instead of allowing the city to straggle outwards in dreary suburbs. The Council finds great difficulty in deciding between these conflicting ideas, upon which, nevertheless, a decision must be reached. We see no inherent reason why suburbs properly town-planned, containing houses designed by capable architects, should be dreary; but there is only too good reason to fear that if suburban expansion is decided upon that neither town-planners nor capable architects will have much say in the matter. The treatment of the approach from Folly Bridge to Christ Church is still undecided. The vacant land in St. Aldates is being used as a parking-place at present, and one or two

STUDY FOR A TERMINAL. By THOS. S. TAIT, F.R.I.B.A.

building proposals have been rejected as unsuitable. A final decision in regard to this site is awaited with some anxiety by those anxious to preserve the amenities of the place.

Wooden Houses

Reading between the lines of recent reports, it would appear that the London County Council's technical advisers are not altogether satisfied with some of the wooden houses erected on the new housing estates of the Council. Whether this is attributable to faults in the material or in the design of these dwellings of foreign provenance is not clearly disclosed; but it seems that a number of the houses erected have proved not to be weatherproof, and that other defects have necessitated a considerable amount of repair work. The cost, too, shows no appreciable saving over other forms of construction which carry a longer loan period; and the Council's Finance Committee are, therefore, strongly advocating that the erection of wooden houses should cease forthwith. The Housing Committee, on the other hand, feel that a policy deliberately embarked upon some time ago cannot be so suddenly scrapped; and this led to a rather animated debate between the Chairmen of the respective Committees at a recent Council meeting. These little differences are not, perhaps, so remarkable as the contrast between the behaviour of these imported systems of timber construction in their own countries and in ours. It is popularly believed that the climate of Sweden is much more rigorous than ours; and, naturally, one would expect that methods regarded there as sound would be equally satisfactory over here. We do not think that the L.C.C. is relying on plywood as an essential part of the construction of their wooden houses; but a correspondent of *The Times* last week reported that it forms the principal material used in large numbers of Swedish wooden houses. Interior walls, for example, are said "to consist of two layers of 6 mm. plywood with a 5-in. air space between," and a great saving in cost is said to result from the employment of plywood, which is also largely used for ceilings and in roofs. The experience of the L.C.C. will no doubt confirm the slogan of many architects that there is nothing like brick; but we should be sorry if it militated against the erection of the traditional English weather-boarded cottage, which, in numerous instances, has maintained a sound and weather-resisting life of a hundred years and more.

Building Trade Wages

The review of building costs in 1926, on another page of this issue, pays tribute to the increased output of building labour as having a steadying influence on prices. At a meeting of the Grading Committee of the National Joint Council for the Building Industry, held in London on December 29, claims were put forward by the Operatives' representatives for the up-grading of wages in 100 towns; and application for degrading certain towns were advanced on behalf of the employers' side. About 70 per cent. of the towns in the Kingdom are already graded A and it will be apparent that a considerable addition to that number will mean a rise in the general level of building labour rates unless the continuance of increased output maintains the steadying influence to which reference has been made. Provided that obtains, there can be no reasonable objection to the increase of pay. The value of high wages as an incentive to good work and better work, has long been demonstrated in America, where building labour is among the most highly paid in the world. Well-paid labour should produce a better type of mechanic, one not only interested in his work for its own sake, but also in the building to which it is contributed. It is the constant regret of many of our leading architects that they have few opportunities of coming into

touch and becoming better acquainted with the craftsmen upon whom they must rely for the execution of their designs, or of discussing with them points in connection therewith which would be better solved by an interchange of views based on the expert knowledge which each possesses. The Royal Institute has endeavoured to further that better understanding between designer and craftsman by a series of special meetings, held recently, and Mr. Coppock, the the operatives' secretary, has paid tribute to the purpose for which these gatherings were instituted. It is not well that the building craftsman should be a poorly-paid and inarticulate hand; and we have heard many architects express themselves strongly on this point. The general level of skill to-day is higher than in the days of the mediæval Craft Guilds and, although we do not think it is possible to resuscitate such organisations it should be feasible to apply some of the spirit that governed them to our modern methods. There is, of course, a "but," and that but turns on the diligence with which building labour applies itself to giving good value for the money it receives. Unless that essential fact is recognised, there is bound to be a slump in building, consequently in employment and wages. 1926 has shown a new spirit in this matter; we trust that 1927 will see it continue and expand.

Babel

A modern Tower of Babel is apparently still an ambition of speculative building enterprise in New York City, for plans have been prepared for a new super-skyscraper, which is over-top all other skyscrapers on the American continent. The Larkin Tower Building, as it is to be called, is to be 110 stories high, rising 1,208 feet from the pavement level, and will occupy a site of 500,000 square feet on the south side of Forty-Second Avenue, the block between Eight and Nine Avenues. The building will rise 12 stories without a break, and then under the zoning laws, will have three set backs to the 18th storey. Above this will be a tower-like structure with set backs at the 63rd, 69th, 75th, 85th, 95th and 100th stories. On the financial side, the building is estimated to cost 3½ millions, the site just under a million and the revenue is expected to be £625,000 per annum. We are assured that such structures are impossible in London, because London has not the rock foundation which Manhattan possesses and because the rays of the sun are never so vertical here as in New York. We are constantly adjured, however, that we shall have to build higher or go down deeper into the ground. Except that it will mean extra profit for one or a few individuals, there seems to be no very good reason why. If, however, building higher means a large number of buildings like the new Larkin structure, it would seem to matter very little whether we built up or down, since sunlight and air would be equally conspicuous in our streets by their absence. It is not stated how many people the Larkin Tower is to house. The day population of the Woolworth Building, which is about half as high, is said to be 13,000, and it takes an hour and thirty-five minutes to empty it. What the Larkin building will connote in this respect leaves one, as the French say, furiously to think.

The North London Magistrate recently made some strong comments on summonses brought by the L.C.C. to recover fees in respect of a survey made by a district surveyor of premises certified by him as dangerous. He thought that the system of paying the district surveyors no salary, but leaving them dependent upon fees for surveys made, was not fair either to the public or the officials, as the latter might be open to the suspicion of saying property was dangerous in order to get fees.

Built to accommodate the tastes of a people very different from those to-day, the Italian Palazzo, as a home, has long since fallen into disfavour. But gradually these houses, often unique in design and their historical associations, are coming into their own again, and, altered to conform with modern ideas of comfort and efficiency in management, are being more and more sought after. In Milan the singularly beautiful House of Atellani has recently been restored by the distinguished Italian architect, Piero Portaluppi. The illustration of the cortile shows how well the original character has been preserved, and although modern conditions demand great restorative measures, the character peculiar to the palazzo has in this case been unaltered.

THE TWENTIETH CENTURY HOUSE—I

By A. TRYSTAN EDWARDS.

Is it likely that there will be evolved a type of domestic architecture which will bear the mark of the twentieth century and will hereafter be described by reference to that period and that period alone?

"The Twentieth Century House" seems a reasonable proposition, but a quarter of the century has now run its course, and this distinctively twentieth century house is not yet in evidence. It is not, however, to the first twenty-five years that I would direct attention so much as to the seventy-five years which are to come, in which the century will, as it were, find itself and declare its true character. I should like, however, to make it clear at the outset that I am not here speaking in disparagement of the many excellent houses which are being designed by architects to-day. Many of these represent separate elements in the movement which will create the twentieth century house. It must be confessed, however, that we see to-day a bewildering number of types of house which are not variations upon a single stylistic theme (as,

of course, they would if the Twentieth Century house had already found itself) but are rather disconnected exercises in a hundred different styles, warring with one another. This state of affairs is easily explicable when we consider the character of the influences which are still being brought to bear upon architecture. It has been said that architects of the present generation have eaten of the tree of knowledge and that they know too much; they are acquainted with too many styles. They are so inordinately broad minded; they are bursting with culture and æsthetic sensitiveness; they appreciate the classic, they love the Gothic; they understand the different charms which may belong to many manners of building. Of some of them, it may be said, that they have had seven styles and yet possess no style.

Originality, vigour, *single mindedness*, are the qualities which distinguish the products of the visual arts in their great formative periods and these qualities, if they are to be effective, must not only mark the

work of a few eminent practitioners, but they must be present in large measure in all the buildings erected in the given period. It may be asked "how can the few eminent practitioners" inspire and control the designs of innumerable lesser men, the vast majority of whom, although conducting building operations, do not even profess allegiance to the architectural profession at all? Is it not notorious that the bulk of the houses being erected to-day are so ugly that societies are being formed with the object of protecting the public against the barbarous exploits of those who design and build them?

Now we come to the crux of the matter. The century, as far as its architecture is concerned, will be judged by the general level of its achievements, for architecture, it must be remembered, is not an individual, but a social art; its products for the most part are not isolated products, but can only be judged in groups and assemblages of which the artistic quality lies mainly in the formal inter-relation of the several elements in the assemblage. Again, the social quality of architecture is expressed by the fact that responsibility for the quality of architectural design does not rest merely with the artist, but is shared by a large number of people who influence him and are influenced by him; and none of the agents whose thoughts and deeds create architecture, whether good, bad or indifferent, can claim for himself the whole merit or be exempt from the ignominy which many attach to the buildings of our time. What, one may ask, is the root cause of the dissatisfaction felt by critics of these innumerable houses which are regarded as a blight upon the countryside? I believe the real reason to be that they are not properly speaking houses at all, they are just overgrown cottages, they are pretentious cottages, characterized by all manner of affectation; they are individualistic cottages, wholly devoid of the social sense. In the series of articles that follows I do not propose to touch the question of cottage design, but shall devote myself entirely to the problem of the house, both large, medium size and small.

Form and subject—these are the elements which comprise the twentieth-century house, and, in order to indicate the wide scope of the present theme, I may say that it will be necessary for me to discuss not only the self-contained house, but the flat or maisonette or any block of buildings in which one or more types of dwelling-place are planned.

It is obvious, of course, that one can have ten houses, all similar and readily comparable in plan and accommodation, which, nevertheless, differ widely in their formal attributes, some being perhaps very beautiful and some perhaps very ugly. Houses may be of identical plan and yet in character and style they may be widely different. Thus we cannot hope to produce a type of domestic architecture by attending merely to the utilitarian aspects of planning. We might study with exactitude all the complicated needs of the present-day inhabitants of town, suburb or country district and devise houses which satisfied the requirements of their occupants in every particular as far as the provision and arrangement was concerned, and yet, architecturally, the result might be chaotic and utterly without distinction. On the other hand, a dignified and extremely attractive looking house which did not fulfil our modern needs would obviously have no claim to be considered an authentic specimen of the twentieth century house. It is apparent, then, that two requirements are needed if this latter is to come into being. It must have not only its appropriate subject but its appropriate form. It is, of course, an agreeable task to design various types of twentieth century house *de novo*, but it is also a profitable exercise to take some older type of house of pleasing design and to alter its accommoda-

tion to the standard which is considered requisite for modern needs. Another type of exercise which would be profitable would be to take a modern house well-planned, but of atrocious elevations, and then, while as far as possible preserving the dimensions and arrangement of the rooms, to give the exterior a more comely appearance.

The first question we must ask ourselves is whether there are certain necessities in modern planning, certain practical requirements, which make it more difficult than heretofore to achieve this comeliness of design which most people agree in desiring for their dwelling-places. If there is such an element in the modern house which introduces a peculiar complication in planning, destructive of the repose and dignity in elevation, it is our obvious duty to tackle that element first; because at that particular point the battle for architecture must be waged with the very greatest determination. It is, in fact, a point of enormous strategical and tactical importance. Unless we obtain a victory here we shall be obliged to admit a total defeat in our efforts to give a worthy expression to the domestic architecture of this century.

If we ask ourselves "In what principal respect does the modern house differ from its predecessors?" the obvious answer is "In the exacting requirements of sanitation." People of to-day need so many more bathrooms and closets, sinks and hot and cold-water basins than formerly. Our standards of lighting and ventilation have vastly improved, with the result that there tends to appear on façades of our houses an unpleasant complex of small windows placed just where they happen to be convenient with a bewildering array of soil pipes, ventilating pipes, waste pipes and other oddments of sanitation which entirely disfigure the design. With regard to this matter of sanitation, it is important to my argument that there be no question of our unconditional acceptance of these improved standards of sanitation. The standards have come to stay, and it would be sheer retrogression to fight against them or even to contend that they should be relaxed in ever so slight a degree out of respect for considerations of formal design. We may admit, of course, that there have existed beautiful houses in which many of the modern conveniences which we now consider necessities were absent, and yet a fine breed of men was raised in them and succeeded in being both healthy and clean in such an environment. Even as late as twenty years ago, for instance, the colleges of Oxford and Cambridge had no bathrooms, and it was customary for the undergraduates to utilise small portable baths placed in their bedrooms. Yet it need not be supposed that they were any less cleanly than their successors of to-day. The important point, however, is that, as we advance in civilisation, the facilities for cleanliness should increase, and architecture should be able to express this improved standard of sanitation without sacrificing its own dignity. If it cannot do this, then, of course, it must let the dignity go by the board, as indeed it has already gone in 90 per cent. of our modern houses. For the health and well-being of men, women and children are far more important than any architectural excellence, real or imagined. This is not to say, however, that architecture should make this surrender to sanitation without an effort to maintain itself. It is my object here, however, to establish a system of design whereby it would be made possible to place bathrooms and closets on the principal façade of a building without the dignity of the façade being impaired thereby. It is my ambition to show how architecture can accept sanitation, can yield to sanitation, and yet in yielding conquer it and subdue it to its own æsthetic purpose. In the next article I propose to elaborate this theme by means of illustrations.

ST. JAMES' CHURCH HALL, MUSWELL HILL, LONDON: THE ENTRANCE.
G. G. WORNUM, F.R.I.B.A., Architect.

New Church Hall, Muswell Hill.

The new Church Hall for St. James' Church, Muswell Hill, which has just been completed, is interesting by reason of the restrictions imposed upon the architect, Mr. G. G. Wornum, F.R.I.B.A. Built upon the site of a temporary building, it was advisable to retain the original drainage system at the further end, and this affected the planning and general layout. It was also necessary to place the main entrance to the building half-way down Birchwood Avenue, as by this means both the main hall and small hall could be served by one vestibule. Messrs. Stevens & Sons, of Highgate, were the general contractors, the total cost being £8,000.

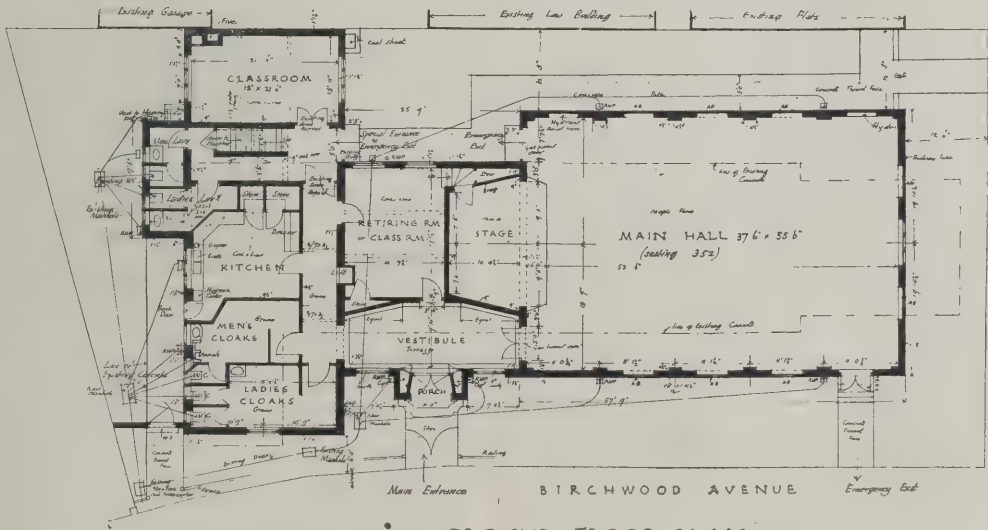

The Last of The Empire

This headline, which appeared in many papers last week, no doubt gave considerable alarm to many who hold despondent views about our political future. It

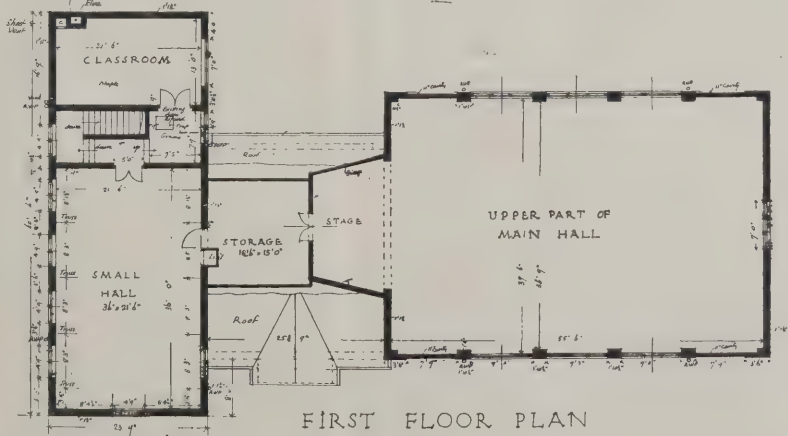

referred, however, not to the British Empire as a whole, but to that minute portion of it in Leicester Square, London, occupied by the famous theatre which opened there in April, 1884. No theatre in the British Empire is, perhaps, more widely known, and there are people in all parts of the globe to-day who can look back to the time when they were entertained within its walls. A variety house, it soon became recognised as the home of ballet, Adeline Genee being the leading dancer for about 15 years, to be followed by Lydia Kyasht. The promenade at the house was the subject of a great controversy at one time. Towards the end of the present month the house will be closed, however, and the work of demolition will be commenced immediately. On the site of the theatre and the large area of now vacant land at the rear and side, an immense cinema house, to hold 3,500, is to be erected by the Metro-Goldwynn Companies of America and London, the design being based on that of the Capitol Theatre in New York.

"Theory and Elements of Architecture"

Reviewed by S. C. RAMSEY.

"*Theory and Elements of Architecture.*" (Illustrated.) By Robert Atkinson, F.R.I.B.A., and Hope Bagenal, A.R.I.B.A. (London, 1926.) Ernest Benn, Ltd., 30s. net.

This is not an easy book to read. At first glance the simplicity of its phrasing and its easy literary quality tends to a belief that it may quietly be disposed of in one or two sittings, but it is too closely packed with thought for this, and too original in matter for so prompt a consummation. If it is not easy, it more than sufficiently pays for the amount of application needed, and the reader's reward for his persistency is a surer knowledge of what is, and what is not, architecture.

By "original" I do not mean that it has any wild or new theories to expound—though its authors certainly have a new way of putting them—but it is original in the sense that it particularly deals with origins, which is, after all, the only originality worth bothering about.

The "Elements" of the title are the walls, roofs, windows and doors, etc., that go to make up any building, together with the materials which are available. The "Theory" is the indication of the way to the use of these elements based on the study of the great builders and buildings of the past.

One of the most valuable and interesting chapters is devoted to the building materials of the ancient world, which means practically the Mediterranean and European world. It deals with the materials available in the different countries, which, together with the climate, are so largely responsible for the different methods of building. I say "largely responsible" because it appears to me that the authors have to some extent (except by a rather vague implication) neglected the *human element* in their philosophy, and, after all, the human factor in architecture is a very important one. This may have been due to reasons of space, to the necessity of circumscribing and limiting their programme, but what they have given us is so good that we may perhaps be forgiven if, like *Oliver Twist*, we greedily demand more. Moreover, there is a hint at the beginning of Chapter X that we may be given something of the kind in the second volume.

By the "human factor" I mean the type of man produced by the climate, the soil, and the geographical position of the country he inhabits. For example, it is of the utmost importance in dealing with the history of Greek architecture to know that there was an abundance of marble and limestone, with a scarcity of timber, at any rate during the historical phases of Greek building, but it is also of importance to know that the Greeks were a maritime nation with pastoral and agricultural interests. A variety of vocational interests, perhaps more nearly balanced than with any other nation before or since, resulting in a balanced and harmonious life, very splendidly and adequately represented in a balanced and harmonious architecture.

The map which accompanies the section on building materials is one of the most valuable contributions to architectural, and incidentally to sociological, knowledge that we have had for a very long time. On it are graphically set out the predominant building materials characteristic of the different countries and the resultant architectural types. Thus there is clearly differentiated the clay architecture of Mesopotamia and Persia, the clay and granite architecture of Egypt, the marble of Greece: the concrete and

stone of the Roman contrasting with the timber structures of Scandinavia and Northern Europe, and the limestone Gothic of the Paris basin the resultant of the clash between the northern and southern types.

In the section on walls, the authors clearly show the influence of the different materials and of the various building stones on particular buildings; whilst in the section on roofs, we are clearly shown the extreme effect the available material has had in determining the main or "plastic" shapes of the buildings. We are made to realise, for instance, how the long straight oak of France and the short twisted oak of England fundamentally changed and distinguished the architecture of the two countries.

Perhaps for the majority of readers the conclusions which are drawn by the authors from their studies, as affecting modern practice, will be not the least interesting. In contradistinction to a certain school of modern architects, who see in architecture nothing but good building carried on in the ancient and approved ways, Messrs. Atkinson and Bagenal hold out no such delusive hopes. They see the modern architect more and more concerned with the proper organisation and co-ordination of the various factors which go to make his building, more and more concerned with office routine and paper direction demanded by the complexities and magnitude of modern building operations.

It would appear that to them the modern architect is analogous to the modern General, who perforce has to spend so much of his time behind the lines engaged with telephones, maps and the details of an intricate organisation. At the same time such a General must, first of all, be a soldier, must know and understand the elements of his craft, and if it is his special danger that modern conditions may force him into a state of unreality and detachment, then these conditions must be overcome if he is to achieve a notable success. To charge at the head of his troops in old-time fashion may appeal to the romantically minded—but it doesn't happen to be war! In the same way the authors of "Theory and Elements of Architecture" warn us of the peculiar dangers that attend the seclusion of the modern architect, and are prompt to make us realise the need for the study of the elements of our craft. To those who are perfectly satisfied with the architecture of this best of all possible worlds in its entirety, I cannot do better than recommend the study of Fig. 169, page 362, with all its implications!

Messrs. Atkinson and Bagenal are to be warmly congratulated on the successful termination of the first part of what must have been a tremendous labour. It is a very valuable contribution to architectural thought and knowledge.

The death took place recently of one of the oldest members of the architectural profession, Mr. George Charles Vernon-Inkpen, F.S.I., F.R.I.B.A., F.I.A. Mr. Vernon-Inkpen was 70 years of age. Born in London he was there articled as an architect, and after practising in the City for a number of years he practised at Chichester prior to establishing an office at Portsmouth. He had been in actual practice for 45 years. Included in the most important work carried out locally with which Mr. Vernon-Inkpen was associated are the George Street Schools, Copnor Schools, Wimborne Road Schools and Fratton Hotel. A prominent Freemason, he was a P.P.G. Supt. of Works, Sussex Province.

LA MOTTE GLAIN. (FRENCH ROOF CONSTRUCTION.)

Competition Notes

Scottish Legal Life Assurance Society

The following architects have been placed on the list for final competition in connection with this competition:—Messrs. Allan & Friskin, 26 Castle Street, Dundee; Messrs. Allan F. Duncan & Alex. Adam, 160 Hope Street, Glasgow; James B. Dunn, Esq., 14 Frederick Street, Edinburgh; A. McInnes Gardner, Esq., 202 Hope Street, Glasgow; Messrs. Hutton & Taylor, 212 Bath Street, Glasgow; Messrs. S. P. Silcock & Son & S.E. Mahon, 6 Egypt Street, Warrington; Messrs. Welch & Hollis, 7 New Square, Lincoln's Inn, London, W.C.; Messrs. Wright & Wylie, 204 West Regent Street, Glasgow.

"Ideal Houses" Competition

The assessors have now reached their decision, after an exhaustive examination, of the fourteen-hundred and twenty-seven designs submitted in the *Daily Mail* Ideal Houses Competition for plans for a £1,500 house and an £850 house.

The results, with the assessors' Report, will be published in the *Daily Mail* on Saturday, January 8. The First Prize house, together with others ranging from a £6,000 Tudor Mansion to a week-end Bungalow, will be built in the Housing Section of the forthcoming Ideal Home Exhibition, which opens on March 1.

League of Nations Headquarters.

The Secretariat of the League of Nations draws attention to the fact that the competition for designs for the new Palace of Nations, including the annual Assembly Hall, closes on January 25. The new building is to cost not more than £540,000, and premiums amounting to £6,600 are being offered, the first premium being £1,200. Sir John Burnet, R.A., is the English member of the jury of nine assessors, with Mr. H. S. Goodhart-Rendel as substitute member. A request was recently made for an extension of the closing date, but the Secretariat found it impossible to comply.

THE FESTIVAL THEATRE, CAMBRIDGE: SCENIC EFFECT FOR MACBETH'S BEDROOM.
EDWARD MAUFE, F.R.I.B.A., Architect.

THE CAMBRIDGE FESTIVAL THEATRE

Under the new name of the Festival Theatre, the "Old Barnwell" has, after half a century's obscurity, re-emerged into the life of Cambridge, to draw crowds to-day with Turner's expressionistic, "The Man who ate the Popomack," or "The Oresteia" of Æschylus, as formerly with a Dicken's reading of "Little Emily" or with "Black-eyed Susan." It stands in the Newmarket Road, rather more than half a mile from the centre of the town, a distance regarded beforehand as certain to be prejudicial, but in practice Cambridge goes to Barnwell as London to Barnes.

Built in 1808, it has an auditorium typically Regency, which accommodates four hundred people, and consists of an amphitheatre and three superimposed circles, made of wood and borne on posts closely set but so light as to cause little obstruction. The whole auditorium is satisfactory from the point of view of visibility and also, thanks to a flat ceiling, from that of acoustics. Beyond the provision of emergency stairs, it has undergone no structural change, but has been embellished with fine new seating, upholstered in turquoise green, and, a necessary measure, with coats of fireproof paint, which hide, beneath Germanic assemblies of gold triangles on a black ground, the amorini on the gallery fronts who, during a recent missionary interlude, had surprisingly been trained to brandish texts. In harmony with the seating colour, that of the curtain, constantly modified by the lighting, yet remains definitely a green, the essential contrast in the scheme being supplied by two ranges of doors, most of them dummies, which are panelled in an insistent vermillion. Parisian wall-lights in the form of opaque glass masks and shells provide isolated spots of ornament. The only pictorial decoration fills a segmental panel set

over the proscenium opening, and seen to advantage against the ceiling, which is kept light and absolutely plain as relief to the wall and floor pattern.

Unlike the auditorium, the stage has been entirely reconstructed and is now extensive. It is without the conventional proscenium frame, the purpose of which is, however, served by steady folds of drapery, and it has a projecting fore-stage, not strictly an apron, reached from the floor of the house by shallow steps, used in the classic manner for choruses and for certain entrances and exits. There being no foot-lights, which is a welcome omission, this fore-stage and the curtain a plane behind it, are lit from the house by projectors, one on each side at the ends of the gallery and three centrally on its front. It is these projectors which make on the curtain an endless play of colour. The acting area is illuminated with extreme efficiency by ordinary means, and the cyclorama by a powerful battery of horizon lamps of the Schwabe pattern. The lighting generally, under the direction of the author of "Stage Lighting for Little Theatres," is a leading feature of the Festival productions, among which there may later be included shows in which light will altogether replace scenery, if not the spoken, too; colour concerts, in fact. Of the plays produced during the Michaelmas term, most scope for dramatic lighting was given perhaps, apart from the subtleties of the "Popomack," by "The Oresteia" and by Gordon Bottomley's "King Lear's Wife," the setting of which is shown in an accompanying photograph.

The stage reconstruction left the green rooms, except for the installation of modern fittings, unaltered; they are adequate, and are conveniently accessible from a stage entrance not on the main road, but on a narrow turning from it. The parts of the

THE FESTIVAL THEATRE, CAMBRIDGE: THE PROSCENIUM FROM THE AUDITORIUM.
EDWARD MAUFE, F.R.I.B.A., Architect.

theatre which are absolutely new are the façade, vestibule and foyer. The façade to the Newmarket Road is very small and rather temporary in character, consisting only of entrance doors with lettering over, and giving at first sight the impression less of a theatre than of a cinema or exhibition pavilion. The doors are glazed invitingly, and are given a quality of importance by their perfectly plain surround and considerable recession from the thoroughfare. The elevation is at night flood-lit, like Selfridge's, in pink. The vestibule and foyer provide ample approach and assembly space, and promise, when completed, to be as interesting in treatment as the auditorium, though at present their structural starkness is relieved only by nineteenth-century play-bills hung on the grey walls and by coloured crockery. They are to be finished during the Christmas vacation.

The architect entrusted throughout with the work of restoration was Mr. Edward Maufe, who was first approached by Mr. Terence Gray, of the Festival Company, only a year ago. The contractors were Messrs. Kidman & Sons, of Cam-

bridge, and the following is the list of sub-contractors: Reinforced concrete, The Monnoyer British Construction Co., Ltd., 58 Windsor House, Victoria Street, S.W.1, and Messrs. Edmond Coignet, Ltd., 125 Gower Street, London, W.C.1; fire escape staircases, Messrs. Haywards, Ltd., 56 Kingsway, London, W.C.2; heating, Messrs. Young, Austen & Young, 12 Buckingham Street, Strand, W.C.2; sanitary fittings, Messrs. A. Macintosh & Sons, Ltd., Market Place, Cambridge; seating, Messrs. Waring & Gillow, Ltd., Cambridge Road, Hammersmith, W.6; fire-resisting paints, Sir W. A. Rose & Co., 1 Fenchurch Avenue, London, E.C.2.

THE FESTIVAL THEATRE, CAMBRIDGE: THE MAIN
ENTRANCE DOORS.

The Rev. H. S. Cochran, Vicar of Harefield, Middlesex, states in a letter to *The Times* that Moor Hall, a twelfth century building in his parish, which was a camera or cell of the Knights of St. John of Jerusalem, has been saved from demolition by the expedient of leasing it from the Uxbridge Council for Church purposes, with the obligation of undertaking necessary repairs. These are to cost £200.

Cutting the Cost to Suit the Client's Pocket

By EDWIN GUNN, A.R.I.B.A.

This distressing necessity, so constantly attendant upon minor domestic architecture, is even more prevalent now than it was, say, 15 years ago, and immensely more difficult of achievement. Though nominally due to bad times and high costs, in reality it is largely influenced by the elevation of many luxuries to the rank of necessities. The man who runs a four-seater car and a multiple-valve wireless set, must excuse a feeling of chagrin in his architect when poverty is pleaded as a motive for keeping house costs within barely possible limits. However—"He who pays the piper calls the tune"; so the architect must perforce "cut the coat according to the cloth" and shut his eyes to the obvious fact that half the suit length has been diverted to other purposes.

As the first item of advice to designers who expect to be close-pinned for cost, I would say—do not cut your plan and specification to the bone when inviting tenders, but include some items which could readily be omitted as a basis for bargaining for price reduction. It may be that tenders will be satisfactory at the first attempt, in which case the work can proceed without alterations; whereas, if reductions are necessary it is found much more readily possible to arrange by a discussion on the lowest tender when definite omissions can be suggested. This, of course, is not to say that deliberate extravagances should be included for the purpose of inflating cost to give a fallacious impression of reduction, but rather that provision should be made for doing some things as the architect would wish, rather than as he fears he will have to, on the chance (all pricing being rather chancy) that the better way may prove possible.

A second axiom for the preparatory stage would be—avoid pernickety detail in specifying, and crowded plans packed with information. Many of your pricing builders will be simple souls to whom such over elaborate documents will appear to present a picture much more complex than the actual facts warrant. I have been continually struck, in relation to simple cottage work which has come under my notice in the past six years, with the constant way in which low prices have resulted from simply-presented plans and simply-worded specifications and the converse from the overwrought kind. It may also be taken as certain that in the vast majority of cases the introduction of one or two virtually unimportant details in a higher plane of quality or finish than the general class of the work (such as an oak floor or bronze casement furniture) will result not merely in the net addition of their own relatively trifling extra cost, but in a general over-riding expansion of cost throughout, due to an impression that the work is of a superior degree of finish than intended. These two instances pertain rather to psychology than techniques.

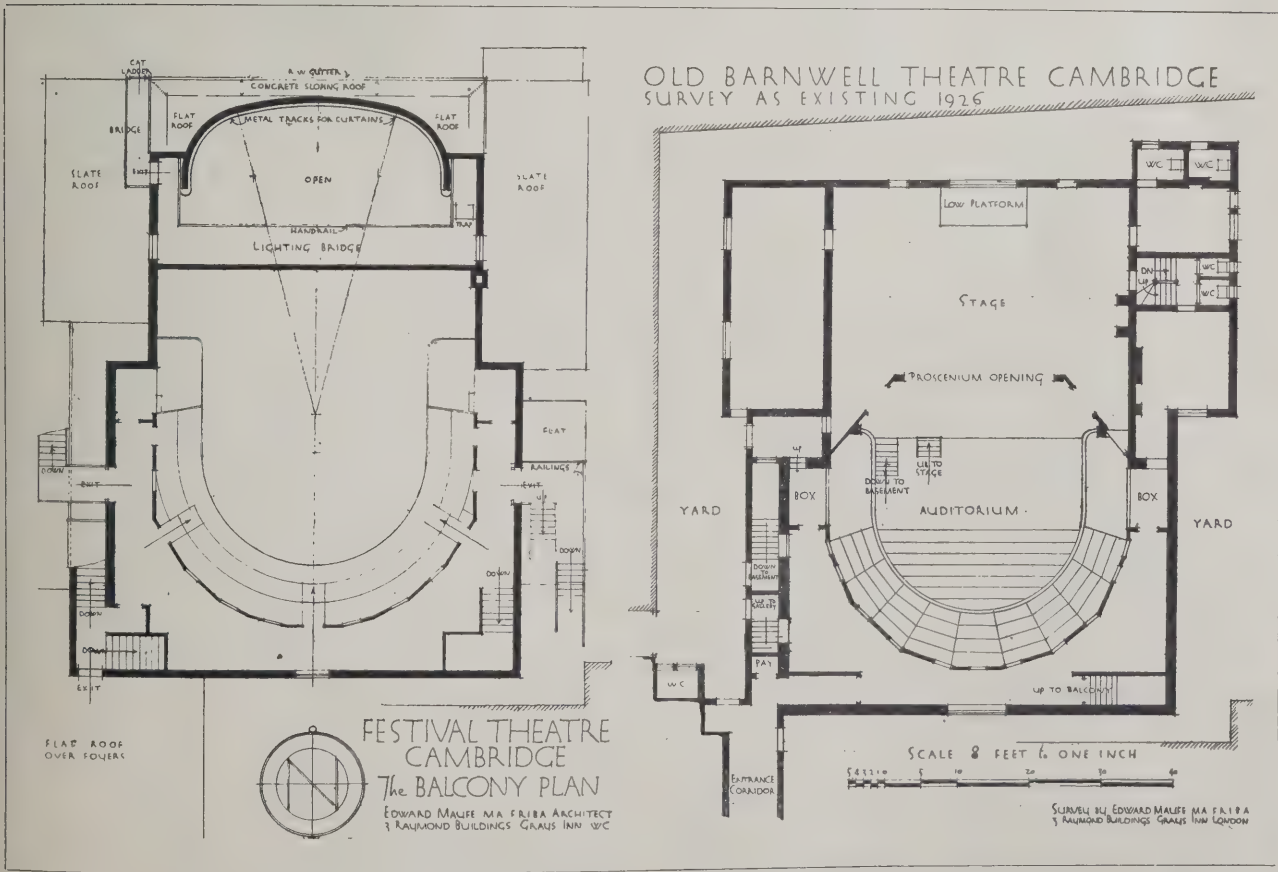

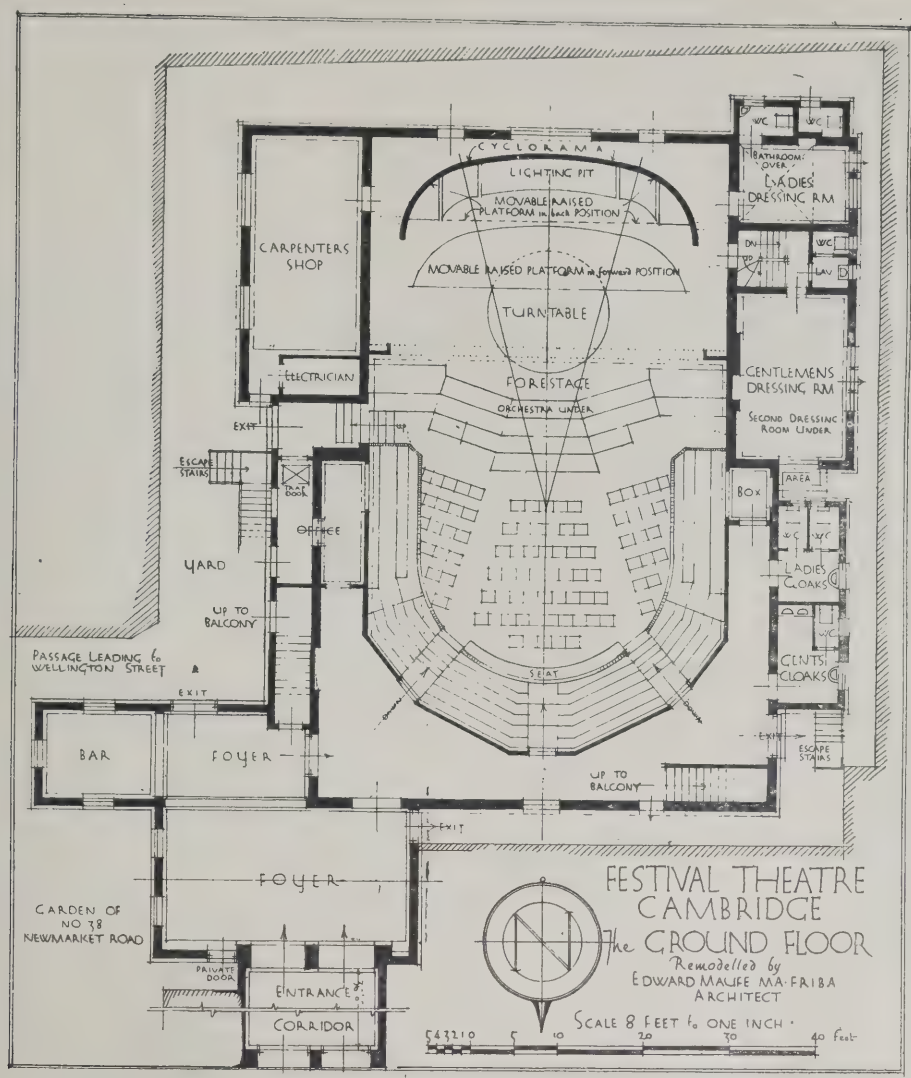

EXCAVATION AND FOUNDATIONS.—Coming from the general to the particular, and starting where the building starts with excavation and foundations, it is considered by everyone that saving on foundations is a foolish procedure. Nevertheless, it is my belief that a considerable amount of money is commonly wasted in this direction, where it can ill be afforded. This is due, in the main, to indecision of purpose, "falling between two stools." Concrete has no special virtue apart from what it stands on, and the first decision to be taken is whether foundations can or should be carried to a firm stratum beyond the reach of climatic changes or whether reliance should be placed on homogeneous spread foundations on a poorer stratum at relatively shallow depth. While

every individual case must depend on circumstances used with judgment, it is quite certain that on clay soils a great deal of fruitless work is done. Clay, when constantly dry or constantly moist, makes a very fair foundation for moderate loads. Unfortunately in passing from wet to dry and *vice versa* it shrinks or expands and when wet it is liable to heave powerfully sideways from the action of frost. It is also liable to slide on sloping beds. To be really immune from these possibilities it would be desirable to sink all foundations to a minimum depth of 5 feet, but to do so with the average small house would involve an expenditure altogether disproportionate to the total expected cost. The speculative builder, of course, does nothing of the kind, and his houses stand, so justifying him. The truth of the matter seems to be that short of going down the full five feet, any penetration into the virgin clay, once that level is reached, is virtually waste and merely exposes a light building to the effects of heaving without securing the advantage of immunity from moisture-changes. It is of much greater utility to ensure that foundation concrete is continuous across door openings than to carry it to intermediate depths. In most seasons two feet will secure stability—about once in twenty years, 5 feet and over will remain unaffected when lesser depths are subject to cracks, but between two feet and five feet shows no advantage for the added cost incurred.

FLOOR LEVEL.—Fixing the floor level in relation to the surrounding ground offers scope for both judgment and economy. Few "level" sites are, in fact, dead flat and any slope should be taken into account. The controlling factors are the dual requirements that the damp course shall be 6 inches above ground and below the level of any floor timbers. The latter requisite in conjunction with a joist and boarded floor will be found to result in a height of ground floor above external soil of 14 inches; *viz.* damp course 6 inches, wall plate 3 inches, joists 4 inches, flooring 1 inch. In the case of a solid floor, however, the height may be 8 inches, or a saving of two courses of brickwork over the whole house. On a dry site, where probably also ballast or other dry material from excavations will be available for oversite filling, there is demonstrable advantage in choosing a solid floor, and on cold, wet sites the same may be true provided that brick rubbish is available for this filling (as often where old buildings are to be demolished).

On any site where a pronounced slope exists, it is worth while to give careful consideration to the placing of the solid-floored quarters so that these come adjacent to the higher ground levels, permitting the joisted floors still to stand at least 6 inches more above ground owing to the slope (and, of course, stepping down the damp course) without projecting needlessly high above garden level. It may even be worth while to lay a block floor on concrete to any necessarily wood-floored room which would otherwise necessitate raising the general internal level, or to take off the surface soil contiguous to the high side or corner so as to allow the damp course to be kept at a lower level at this governing point.

Almost all post-war efforts to reduce building costs has been directed to devising substitute methods of wall construction, and few can be described as successful, in so far as they dwell chiefly on the straightforward walling, and fall into unexpected difficulties wherever such ordinary complications as openings, floor supports, chimneys, or fixings for fittings are

THE FESTIVAL THEATRE, CAMBRIDGE. EDWARD MAUFE, F.R.I.B.A., Architect.

encountered. It is only under exceptional circumstances that they show any real economy in the case of a single house and though it may be wise to keep an open mind, and not overlook the occasional opportunity yet it is with normal methods of construction that the architect of the small private house will chiefly be concerned. To such the possible economies in walling will be few, and again must depend on local opportunity—for instance a poor and cheap local brick—virtually place-brick—may yield a sound and dry house if strap battened and weather-boarded externally; a sound brick of unpleasant exterior may be slurried over with a slush mixture of super-cement and colour wash; in some districts 11-inch cavity walling of local clamp-burnt stocks is the cheapest reliable construction; while in others dense non-absorbent bricks with cement mortar joints may be used in 9 inch work which will exclude the weather. Plastered or slurried exteriors admit of simplification of treatment above all external openings by hiding the construction, which may thus, without offence, be a concrete lintel for the full wall thickness.

It is of course a truism to say that a simple plan free from unnecessary angles and returns is cheapest in all circumstances, but with an eye on the wise by-law restriction of 9-inch or 11-inch walls to a length of 30 feet between return or cross walls it is sometimes advisable to introduce breaks as the lesser of two expenses. Another truism is—use always brick dimensions.

WINDOWS AND DOORS.—Where a builder's foresight and credit will allow him to obtain such accessories in good time, the use of standard cottage metal casements for building in direct to brick jambs, and of Unit doors complete with lock and furniture and ready-hung to linings and architrave are a real economy, as they cut out altogether many trifling jobs involving interference of trades and consequent lost time. In setting the metal casements always leave a space of fully $\frac{3}{4}$ -inch at the jambs to allow a good cement fillet which will be solid and not drop out. It is a pleasant and allowable trick to plaster the internal jambs with a cement undercoat on the splay from $\frac{3}{4}$ -inch next the frame to nothing at the internal face of wall.

If "mass-production" articles are not received until after openings have been formed it will generally prove to be no economy to employ them under the rather un-precise methods of the everyday workman, whose openings rarely fit.

UPPER FLOORS.—When buildings are properly schemed to provide suitable spans, these may be constructed at considerable saving of timber, on the beam and joist system. With beams 4 feet apart in the clear, 4 inch by 2 inch joists may be used at ordinary spacings, and ceilings formed with a suitable ceiling board used in uncut widths. It is not lack of strength, but the necessity for rigidity to prevent cracked plaster, which conditions most floor construction. Apart from incidental economies a saving of a course of brickwork over the building results, and a step in the staircase can also be "lost."

ROOFS.—Simple roofs without hips or valleys save in several directions: carpentry, leadwork or tiler's allowances for extra measurement; cutting hip and valley tiles; eaves gutters, down-pipes and drain connections. A typical tiler's bill for a complex roof should be examined by every young architect as evidence of the proportion which the etcetera bear to the straightforward "per square" cost. A roof structure depending on "hangers" from the ridge board supporting relatively deep and narrow stiffeners (say 7 inch by 2 inch) crossing above the ceiling joists and bearing the feet of struts to comparatively light purlins will knit together a stiff roof and be

much better than purlins of greater cube which depend on hip rafters or gable walls solely for support. These are sometimes a dead weight rather than a help.

CHIMNEYS.—Chimneys brought out beside the ridge board (which continues unbroken) are also a simplification. In this position they need no back gutter, and soakers with cover flashing are a simple matter. A great deal of temper and money is wasted by optimists who build low chimneys rising from the eaves. What they save on the swings (or bricks) they lose on the roundabouts (or gutters) and about one in ten so built fails to draw, resulting in various expenses on patent pots, raising stacks and attendant annoyances.

INTERNAL JOINERY.—In internal joinery (what Americans call "trim") straightforwardness is the best aim. Door and windowheads should be arranged at such a level that a picture rail may run unbroken without needless returns, stopends, and mitres. A dozen 6-inch tiles—quarries or glazed "according to context"—makes a sufficient surround for a bedroom grate or gas fire and the latter needs no more than a 9 inch by 4 inch flue and less than the normal coal fire hearth.

DECORATION.—In decoration the choice of a single colour for wall-distemping saves delays and wasted remainders, while Solignum on all woodwork internally saves materially on paint. Externally paint, which is a skin, is to be preferred to anything which is only an absorbed solution.

FITTINGS.—In selecting fittings—stoves, sanitary goods, and such like—there is still considerable scope for variety in price despite this standardized age, but into this field it is hardly possible to venture.

Coming Events

Birmingham Architectural Association.—Friday, January 7.—Mr. H. P. G. Maule on "Some Notes on Building for Research Work." Birmingham.

Edinburgh Architectural Association.—Wednesday, January 12.—Mr. William Mackay Mackenzie on "The Palace Plan in Scottish Castles." Edinburgh.

Sheffield, South Yorkshire and District Society of Architects and Surveyors.—Thursday, January 13.—Mr. Hope Bagenal on "The Science of Acoustics."

The London Society.—Friday, January 14.—Mr. K. Rice-Oxley on "Hyde Park and Kensington Gardens." (Illustrated by Lantern Slides) 5 p.m.

The Royal Institute of British Architects.—Monday, January 17.—General Meeting; Award of Prizes and Studentships: Criticism by Robert Atkinson on work submitted.

University of London.—Tuesday, January 18.—Dr. E. G. Richardson on "The Acoustics of Buildings." Further lectures will be given on January 25 and February 1. 5.30 p.m.

The London Society.—Wednesday, January 19.—Visit to the Coliseum and an inspection of the various parts of the building of interest. 11.15 a.m.

"Birmingham Gazette" Brighter Homes Exhibition.—Birmingham, February 8-19.—Particulars from Provincial Exhibition, Ltd., City Hall, Manchester.

The Second Edinburgh Housing and Building Exhibition will be held at Waverley Market, Edinburgh, from February 9 to 19, 1927. Plans and details from: Mr. T. Percy Bentley, Exhibition Offices, 7 Waverley Market, Edinburgh.

Manchester Building Trades' Exhibition.—March 29-April 9.—Particulars from Provincial Exhibitions, Ltd., City Hall, Manchester.

HOUSE OF MONSIEUR A. M. AT VERSAILLES: THE GARDEN FRONT (NORTH). ANDRÉ LURCAT, Architect.

TWO SUCCESSFUL FRENCH HOUSES IN A MODERN SPIRIT

The modern French domestic work of the "school" which is typified by houses, such as those by Monsieur André Lurcat which we illustrate, has qualities which can scarcely be denied to it even by those critics who are antagonistic to the tendency which it reveals.

Putting aside all question of individual taste, the test of this modern architecture is the application of these principles in design and construction which are universally admitted; the fact that these principles are applied with that thoroughness of logic which is characteristic of the French as a race is probably the explanation of any shock which may be caused on the English mind, which is accustomed to look for logic softened by associations of tradition and even of sentiment. Inevitably there is something a trifle ruthless about architecture which is obviously designed to appeal to the intellect rather than the heart.

In this work of Lurcat's, as in the buildings of some of his contemporaries, one feels immediately the pre-occupation of so organising the building's plan that *space* shall be utilised in the most economical and effective way. The most pressing problem of the modern architect, from the client's point of view, is to provide the maximum of well-arranged accommodation for a limited expenditure; and the only way in which this can be achieved is by a disposition of the plan which takes full advantage of available areas from the point of view of actual sizes and also of *apparent* sizes. Every designer is aware that two apartments of equal superficial area may give different impressions of spaciousness according to the disposition of their plan shapes and the arrangement

of such elements as doors, windows, and fireplaces, not to mention, of course, the important question of ratios of ceiling height to dimensions of length and breadth. It is possible so to plan that a room will give possibilities of vista, either within its own walls, or through the inclusion of views into adjoining rooms, which will increase effects of space in the same way (as Mr. Walter Bayes pointed out at a recent lecture to the Architectural Association) that the appropriate treatment of wall surfaces will either confine or enlarge the apparent size of any enclosed area.

The plans of Le Corbusier should be analysed from this point, as well as those which we illustrate by Monsieur Lurcat in this issue. Le Corbusier's principle is to include, as far as is practicable, subsidiary rooms or lobbies within the compass of some apartment to which he desires to give a marked appearance of spaciousness. An instance of this would be a low wall separating, *e.g.* a library recess from a living room. Whether this wall were surmounted or not by a glazed light for the purposes of greater separation, the effect aimed at would be identical. One would see the ceiling and the upper part of the walls of the recess from the living room, and the spectator would have an effect of space over and above that of the particular floor area in which he was confined. It is an instance of producing perspectives and effects of distance in the same way as has been attempted in wall treatments in false perspective, but here the effort is completely justifiable and sincere, and is realised by the visualisation of plan possibilities. The "bibliothèque" on the second floor of the "House for Monsieur E. B." at Versailles is designed in this

HOUSE OF MONSIEUR E. B. AT VERSAILLES: THE ENTRANCE DOOR AND STAIRCASE.
ANDRÉ LURCAT, Architect.

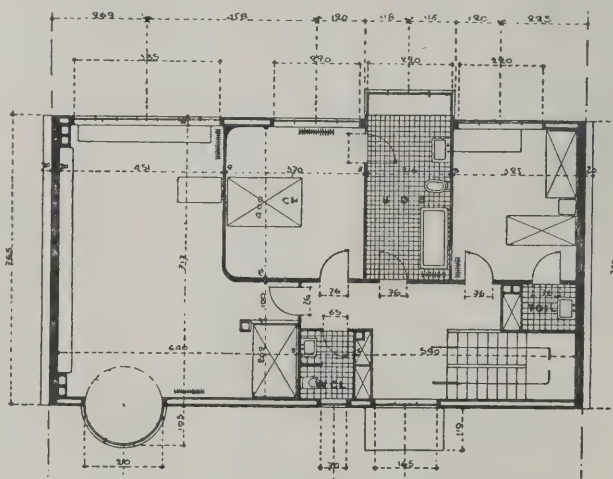

THE GARDEN OF THE HOUSE OF MONSIEUR E. B. AT VERSAILLES. ANDRÉ LURCAT, Architect.

way with its semi-circular bay and L-shaped plan. The arrangement of the bay and the recess contributes more effectively to an appearance of space than would be the case if their superficial areas had merely gone to increase the size of the main rectangle of the room.

French planning has, of course, always been distinguished by spaciousness, largely owing to its axiality and preoccupation with vistas. But in domestic work, axiality is apt to be impracticable (for one thing it is extraordinarily productive of draughts), and the modern French planner is surmounting the difficulty by solutions which occur to him the more readily through his training in the importance of plan forms.

A characteristic second only to the logical study of the plan requirements is that of sincerity. There is nothing in these houses which attempts to disguise the nature of the

FIRST FLOOR PLAN.

HOUSE OF MONSIEUR E. B. AT VERSAILLES: GROUND FLOOR PLAN. ANDRÉ LURCAT, Architect.

problem or the manner in which it has been met. The client's programme is all the more difficult of solution through its very simplicity — space, well-building, and economy — and its requirements are loyally met by means which are at once legitimate and interesting. The lighter touches which accompany the necessarily severe structure are achieved primarily through the treatment of form as distinct from applied ornament; they are decorative, but in the sense of cleanness and precision, and they are dignified in the economy of their means and the suggestion that the taste to which they cater is chaste and eclectic. There is more than a hint in such details as the external steps and the metal work of the railings and the lamp under the door hood that the architecture of moderate means may some day in the not distant future have once more its own title to pride and aristocracy.

THE GARDEN FRONT.

ELEVATION TO STREET.

HOUSE OF MONSIEUR E. B. AT VERSAILLES. ANDRÉ LUCAT, Architect.

HOUSE OF MONSIEUR A. M. AT VERSAILLES: ELEVATION TO STREET (SOUTH)
ANDRÉ LURCAT, Architect.

If there is any recognised architectural tradition which these houses recall, it is perhaps with the period of the Regency that there are the greatest affinities. Certain Regency types have a kind of lean simplicity which could easily produce such derivatives as these modern houses. The materials are other, methods and means of construction are different, but there is still a community of architectural style; and perhaps it is this hint of Regency graciousness softening severity which makes these houses of Monsieur Lurcat seem so acceptable and so promising from the point of view of modern domestic development.

The house of Monsieur E. B. at Versailles has utilised, as the plan shows, the whole of its site between party walls, and its ensemble is completed by the pleasant little garden which the architect has designed in layout and detail to harmonise with the spirit of the house. There is a long and narrow pool on the main approach axis, at the end of which is a simple garden retail, which, like the external walls of the house, is coloured in a pale blue wash.

The construction generally is in reinforced concrete, the walls in two slabs with an infilling. All the joinery and the windows are made in series, to standard sizes, and, in addition to the interior decoration a good deal of the furniture was specially designed by the architect.

Not less attractive is another house at Versailles by Monsieur Lurcat for Monsieur A. M., with an extremely interesting garden façade and an entrance front which with all its modern feeling seems quite at home in this town of historic marvels. Here again is a clean simplicity; and yet the architect has imbued his design with the friendly spirit. Above all, these designs show that the basic principles of good architecture are universal in their application to new forms and methods as well as to the old.

Book Review

Houses, Cottages and Bungalows. Edited by Frederick Chatberton, F.R.I.B.A. London: The Architectural Press. 7s. 6d. net.

This is a handsomely produced collection of recent examples of the smaller domestic work. The editor in selection adopted a cost limit of approximately £2,000 for houses and a maximum of £1,500 for cottages and bungalows. Within these prescriptions he has contrived to bring together illustrations of a hundred interesting works, by sixty different architects, which may be studied with advantage both by the profession and the lay public, and has supplemented the views and plans by useful notes on cost and materials used. What is chiefly noticeable in the work is the capable and convenient planning of most of these smaller houses, showing that the designers, mostly of the younger generation, have a very clear grip of the problem of giving the utmost value in these days of dear building. In domestic work everyone has his predilections, and if we adjudge some of the houses shown as less economical and successful in planning and treatment than others, we do so with the full consciousness that the client is frequently responsible for what the professional man might consider unnecessary and expensive features. Mr. Oliver Hill's house at Aldeburgh, Mr. Sydney Jones' house at Dulwich, Mr. Douglas Wood's house at Stanmore, and, in a different medium, Messrs. Culpin and Bowers' house at Sevenoaks, strike us as the best among a good collection. We have never quite got acclimatised to bungalows, but Mr. S. J. Wearing, in Norfolk, and Mr. Raymond Wrinch, in Suffolk, have achieved two dwellings of this class that possess a quiet individuality and character.

NEW NEEDS AND MODERN NOTIONS—I

By EDWIN GUNN, A.R.I.B.A.

THE remarkable increase in the variety and complexity of domestic apparatus which has followed on the cult of labour-saving, with the concurrent development of tight planning, due partly to the same motive and more largely to high building costs, seem to have received only casual and erratic consideration as relating to the fitting out of the average house. Though, for instance, modern practice has rendered the provision of a kitchen dresser (whether open or closed is immaterial), a nondescript cupboard or two, and a coal store of exiguous proportions wholly inadequate to the needs of the average household, they continue to be the common provision for storage of domestic utensils and fuel.

A tendency, perhaps not unnatural, for a builder, when pricing out a design, to place a disproportionately heavy price upon any item not strictly ordinary is largely to blame for this apparently supine adherence to precedents long outworn. Every architect who has essayed to design improved fittings or methods of finish can recall instances where the sole result has been the trouble to himself in so doing followed by deletion or alteration to get back on the old hackneyed lines before an acceptable price could be arranged. The enthusiastic advocates of complicated domestic fittings (mostly, it seems, lady members of Local Bodies) are apt to disbelieve or discountenance this highly material if unfortunate

fact, which is here set down, in case the idea is established by these articles that departures from normal practice can be made without risk of increased cost. To take the simplest case: it is not a fact, as most women seem to suppose, that "cupboards cost nothing, the builder commits them; they always happen in a nice house." I quote the words uttered in irony by that wise and witty writer on architectural topics, Mr. H. B. Creswell.

The directions in which it seems desirable that closer consideration should be given to modern

domestic needs classify themselves roughly as storage and domestic mechanisms, the former embracing specific commodities which are better recognised and provided for by occupants, and the latter covering all the heating, sanitary, lighting, and power services and their appurtenances which we all like to possess but do not necessarily wish to exhibit.

The list of articles which must be recognised as separate classes for storage purposes is quite a long one. It may be stated (not necessarily in order of necessity) as fuel, food, clothing, hardware, and domestic apparatus, with an addendum for bicycles and garden implements. In the smallest and simplest house of all, it may be sufficient—or at any rate practicable—to provide storage for each class without considering subdivisions, but none should be omitted, and as within the list the actual requirements call for different conditions, it will be best to examine each class systematically.

FUEL.—The almost entire supersession of the old-time kitchen range as a principal means of hot-water supply by independent boilers burning coke or anthracite has rendered the provision of at least two separate stores for fuel a virtual necessity even in the smallest house, and where anthracite stoves as well as coke boilers and an open living-room grate are in use three compartments will be requisite. The sole exception to duality is that of the house entirely central heated, but this is uncommon, and it should now be ordinary practice to supply at least two fuel stores. In the smallest type of house it is probably uneconomical to build, at 1s. 3d. per foot cube, storage space for fuel, and it may be that external bunkers of creosoted fir will be decided on, particularly as the upper space above 4 feet (virtually 50 per cent.) is almost useless for storing fuel. Ingenious planning may, however, render it possible to utilise this space for other purposes.

The desirable features for a fuel store are: that fuel may be inserted from outside and withdrawn under cover. In most cases this is sufficiently achieved when the single door is under a covered porch, but in some cases the better arrangement of an external shoot and internal doorway to a back lobby or boiler-space is

readily arrangeable. The floor should be smooth for ease in shovelling, and it is a good plan to make its general level about 4 inches below that of any adjoining place, sloping up about 2 feet of floor towards the doorway. This prevents coal dust from working out below the door. In the case of anthracite and coke, which are cleaner in use than soft coal, it is not found impossible to arrange for withdrawal direct to the kitchen or boiler-room in a position handy for use, thus saving scuttle-filling and twice handling.

The fuel place doorway will generally be fitted with loose boards sliding in grooves to retain fuel and permit the full capacity up to 4 feet in height to be utilised. It is a good plan to have stops at the bottom of the grooves about 9 inches in height so as to hold up the bottom board and thus preserve a gap permitting fuel to be shovelled at floor level. This will render it easy to extract small coal and dust as well as the lumps which gravity sorts towards the top. Where space is valuable it is a useful practice to keep the retaining boards about 4 inches in from the inner face of the door, which can then carry the broom rack, the broom handles finding space between door and boards (Figs. 1 and 2). The requisite size of storage space may be computed on an average of 40 feet cube per ton for house coal—that is to say, reckoning on a storage height of 4 feet, a 6-ton truckload will require a store 10 feet by 6 feet. The 4-inch drop in floor level gives a margin of half a ton at this dimension. Coke is more difficult to calculate—it varies so much in bulk with density of grain and gauge of breaking—generally good gas coke broken to hen's egg size suitably for domestic boilers will occupy about 60 feet cube to the ton when dry. Coke is, however, so much more a matter for local supply than coal that so large a storage reserve is not usually provided; about 2 to 3 tons will run the ordinary small domestic boiler continuously throughout a winter.

With regard to the utilisation of the upper space over fuel storage, it is, of course, a common resource to scheme the store below a stair half-landing. Where this is inconvenient but the storage can be planned to range alongside kitchen quarters, it is a boon to contrive a store cupboard for preserves and articles not constantly in use by flooring over the fuel store at about 5 feet and opening up with doors to kitchen

Fig. 1.

Fig. 2.

or scullery from this level. It is undesirable (though often attempted) to use the upper space undivided for gasmeter and electricity distribution boards, meters and cut-outs, but horizontally partitioned as described above this is another useful purpose to which to devote this frequently wasted space.

A REVIEW OF THE PROPERTY MARKET, 1926

By EDGAR H. LANE.

It would be untrue to say that the property market during 1926 maintained the buoyancy desired by those connected with it, although there have been a great number of transactions of more than usual importance. The industrial dispute from May onwards undoubtedly had a "slowing up" effect upon the market generally and, in the later months of the year, business lulled considerably.

Agricultural estates and land sold poorly and prices generally were inclined to fall, thus continuing the tendency of the preceding year. Undoubtedly the demand for farms and farm lands was much below normal. The number of holdings, offered both privately and by auction, which did not find buyers was large, and this feature, unfortunately, continues. It is noteworthy that buyers seem to be seeking fair-sized properties, and that many good small ones were disregarded in the sale rooms.

Speculators (a much maligned body who have occasioned more good than harm, particularly to farmers) have consequently been less active. The difficulty of realisation, together with the uncertainty of prices, has made them slow to buy. Evidence of depression, also, can be found in the increasing number of farms being offered on rental terms. Another significant sign has been the fact that whereas, during the past ten or fifteen years, the market was steadiest where land of good useful description, selling at £30 to £40 per acre, was concerned, it is now found easier to place land of poorer quality.

Building operations, continuing the post-war activity, have made their influence felt, however, in the urban market.

In and around the City of London many fine buildings have been commenced or completed, the majority on sites which have been specially acquired.

The new buildings on the old Post Office site, the offices of the London Caledonian Insurance Company, Chronicle House and Bouverie House in Fleet Street, Northcliffe House and the new offices for the *Daily News* and *Star* in Tudor Street are some of the most recent. The *Daily Express* is to build new offices in Shoe Lane; and the London Electric Company are about to build on the site of the Old Salisbury Hotel, which has stood undisturbed for a century or more, nestling quietly away from Fleet Street, and will be missed by many.

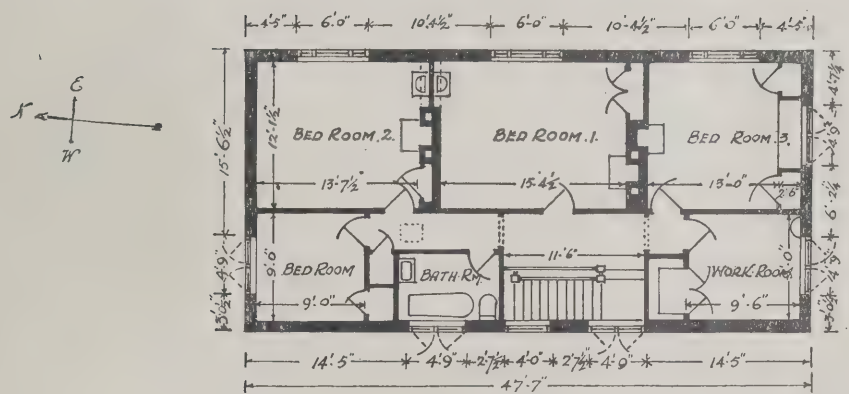

Then, whether or not to demonstrate its disbelief in the right of private ownership I know not, I understand that *The Daily Herald* is acquiring the property it occupies in Carmelite Street. Another big property deal is represented by the erection of new premises for the *Daily Sketch* in Gray's Inn Road, at present only partially completed.

One feature which the year has emphasised is the tendency in London of commerce to move westward. This tendency is very definite, with a consequential increase in the value of West End properties. It would be difficult to speculate quite where this will end. Certainly it has already begun to disturb to a remarkable degree the exclusiveness of residential Mayfair. Taking its boundaries as Oxford Street on the north, Piccadilly on the south, Bond Street on the east and Park Lane on the west, Mayfair was, excepting the south-east corner and a few shops chiefly of the accommodation variety, dotted here and there to serve its needs, exclusively and proudly residential.

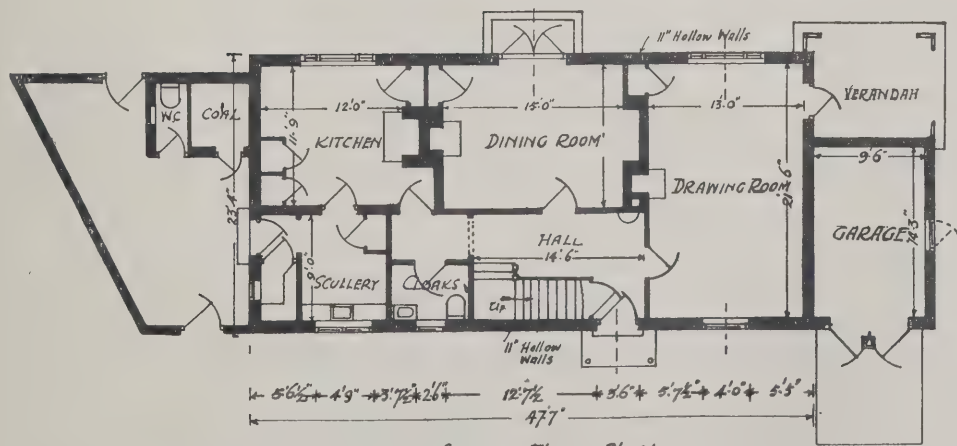

Bruton Street, except for one or two shops hard by Bond Street (there for the most part of a century) so very repelling, where even the suggestion of a name-plate would have offended, now boasts a motor-show room, a tailor and a furrier, not to mention,

THE GARDEN FRONT.

FIRST FLOOR PLAN

GROUND FLOOR PLAN.

high up in one of its buildings, the beauty parlour of a celebrated actress. Brook Street may now also be considered a business address.

Grosvenor Street finds many of its best houses serving for commercial purposes. Davies Street, where the Duke of Westminster has his house, has always been a little uncertain. The latest building being erected in this thoroughfare is an important block of shop and office property. Grosvenor Square has not escaped either. It is true that there is a stipulation that no business shall be conducted upon premises within 50 feet of the square, yet on the site of No. 48 and on the other side of Carlos Place, on the site of No. 49 and 50 Grosvenor Square, are being built two important blocks of flats with business premises under. Thus the fringe of this most exclusive of residential districts, associated in time past and present with rank and wealth, is caught up by the march of commerce. In passing, I cannot refrain from mentioning a rather interesting point as to user contained in one of these leases. It is that whilst the premises may be occupied by an architect, auctioneer, accountant, silversmith, ladies' clothier, tailor, etc. etc., a solicitor is barred.

But perhaps the greatest rise in value of any London thoroughfare has occurred in the development of Berkeley Street. At the corner of this thoroughfare, occupying an island site, stands the New Devonshire House, a massive structure of business premises with flats over, built largely in accordance with American ideas. The ground floor premises have found tenants in one of our largest motor-car distributors and a well-known French motor firm, each holding at stupendous rentals. The flats are being offered on long leases of 99 years, at low rentals of from £65 to £280, in consideration of premiums varying from £5,525 to £25,000; or, in other words, the leases are being sold on a ground rent basis. This has been commented upon in some quarters as the first attempt to introduce this principle of tenure for flats in this country, which is erroneous, for it was tried many years ago but without success.

There is little doubt that the largely increasing public which is changing over from houses to flats desires to limit its responsibilities; and with the increasing number of flats offered on the more usual rental terms there are many objections, from a tenant's point of view, to taking a property on, what I have termed, "a ground rent basis." There might be difficulty in realising in the future if the property concerned was no longer considered up-to-date or meeting the latest requirements. Adjoining Devonshire House, Messrs. Thomas Cook & Son's new premises on Berkeley Street have been completed, and immediately north is the new pile which is to be known as Mayfair Hotel. Thus this thoroughfare takes its place among the most important in the West End, upon which I must confess a little satisfaction, as several years ago I predicted a great rise in value in this thoroughfare.

There has been commenced the development of the Grosvenor House site in Park Lane, taken over, with its £25,000 per annum ground rent, from the executors of the late Lord Leverhulme. Here, again, shops as well as flats are said to figure in the building scheme. Somewhat ironically, Park Lane is also to house the offices of a building society, which has purchased the somewhat cast-iron Gothic residence near Hamilton Place. The famous Dorchester House is also in the market, and its fate is at present uncertain.

Eastward, Regent Street has during the year witnessed the completion of further rebuildings, whilst between New Bond Street and Regent Street there has been, and is, a great deal of building activity.

A particularly sound development should be the conversion of the north side of Burlington Gardens, between Cork Street and Old Burlington Street, into shops and business premises.

But what might, perhaps, be considered the principal West End transaction of the year, as indicative of values, was the sale of the Burlington Arcade. This property was acquired in the first place by one purchaser, who turned the property over at a considerable profit, the sub-purchaser submitting the property to auction and selling as a whole at £330,000. Subsequently, the individual shop premises were offered in lots upon leases of 80 years, subject to reasonable ground rents; and the prices paid for those sold (purchased in most cases by the tenants) go to show that the tenants, who in many cases had taken up recent leases, value the property from a rental point of view at considerably double the rentals paid on leases granted in recent years.

Probably the most spectacular deal, however, was the sale of the Foundling Hospital Estate to the syndicate which, in conjunction with the Beecham Estate and Pills, Ltd., proposes to move Covent Garden Market to this site. The purchase price is stated to have been about one million and three-quarters.

In conclusion, one may say that the year 1926 has been a satisfactory one from the architects' and builders' point of view, but that the year 1927 might well be even more prosperous. In this connection I should like here to suggest that property experts, by which I mean those with specialised knowledge of the requirements of certain districts, would be wise to enter into closer collaboration with architects in order that the best scheme of lay-out and building might be adopted for sites about to be developed. My experience during recent years has shown me that there have been many instances where a fine site has been ruined by bad development.

New Bakery at Welwyn Garden City

The new bakery at Welwyn Garden City is an admirable example of the successful co-operation between the architect and his client. In this case it was almost essential for the architects, Messrs. Louis de Soissons and Arthur W. Kenyon, to make themselves thoroughly familiar with the whole process of bread-making and baking, thus the various bakery engineers consulted were in themselves more in the nature of the clients. The process of manufacture which obviously governs the design of all buildings of this nature is as follows—the flour is electrically hoisted to the second floor in the mansard roof, where it is stored. The first floor is entirely devoted to the mixing and proving of the dough, which is afterwards sent down by the chute to the bakery on the ground floor. On this floor are the ovens, stoker, heating chamber, girls' mess room, men's mess room, despatch room and confectionery. Access to the despatch room from the covered carting space is effected by three openings closed by roller shutters.

The general contractors were Messrs. Welwyn Builders, Ltd.; Welwyn Stores, Ltd., Electrical Installation Department (electrical work); Messrs. Baker Perkins (dough divider and hander-up); Messrs. Artofex, Ltd. (tempering tank, sifter and hopper); Messrs. Metropolitan Vickers Electrical Co., Ltd. (electric ovens); Messrs. Baker Perkins (ovens); Messrs. James Gibbons (steel windows); The Standard Metal Window Co. (steel partitions); Messrs. Smith Walker (steelwork); Messrs. Hale & Son (iron balconies); Messrs. The Door Unit Co. (doors); Messrs. The Ragusa Asphalte Co. (asphalte); Mr. W. Nobbs (heating and lighting).

Professional Societies

Royal Institute of British Architects

In a recent communication the Royal Institute of British Architects states: the Registration Bill was unanimously adopted at the R.I.B.A. Meeting on December 13, and the Council was authorised to endeavour to secure its enactment. The first step is to obtain from Members of Parliament a Promise of Support and an undertaking to Ballot for the Bill on the reassembling of Parliament on February 8, 1927. The Allied Societies are invited to co-operate by taking Immediate Action on the following lines:

- (a) To approach all the Members of Parliament in the constituencies in their areas, sending them copies of the Memorandum to M.P.'s and of the Registration Bill.
- (b) To send to the registration Committee before January 17, 1927, a list of the Members of Parliament who have been approached, with a note of the results, whether favourable or unfavourable, and of any promises to ballot for the Bill.

A circular, relating to the voluntary register of architects not being members of the Institute or its allied Societies, can be had on application to the secretary of the R.I.B.A. Registration Committee.

The assistance of the Allied Societies in getting all unattached architects to enroll in the Voluntary Register is earnestly desired.

R.I.B.A. Examinations

THE INTERMEDIATE:—The Intermediate Examination, qualifying for election as Student R.I.B.A., was held in London from November 19 to 25, and in Manchester from November 19 to 24, 1926. Of the 69 candidates examined, 31 passed and 38 were relegated. The successful candidates are as follows, the names being given in order of merit as placed by the Examiners:—J. E. Potter, J. T. Castle, J. W. Poltock, J. J. Coleman, H. C. Farmer, L. Pugh, E. J. Harrison, R. T. Kennedy, D. C. Hodge, H. A. Hogarth, W. R. Helm, T. L. Marshall, J. N. Aylwin, P. O. G. Wakeham, T. E. S. Thwaite, A. Bailey, C. E. W. Boreham, J. G. Clementson, P. W. Dawney, A. H. Farmer, W. H. Kinnimonth, O. H. Leicester, J. L. Morgan, C. L. Morris, E. Oakley, D. Roth, R. Shaw, T. F. Thomson, Anne M. O. Trouton, N. Willis, W. G. Wright.

THE FINAL EXAMINATION.—The Final Examination, qualifying for candidature as Associate R.I.B.A., was held in London from December 1 to 9, and in Edinburgh from December 1 to 8, 1926. Of the 38 candidates examined 21 passed and 17 were relegated. The successful candidates are as follows:—G. E. Bunce, T. A. Collins, A. Craig, G. F. Evans-Vaughan, W. H. Ford (Part I only), A. H. Gardner, A. E. J. Goodall (Part I only), F. G. Goodin, R. H. Graddon, R. N. Guy, A. J. Hobbs, A. T. Hope, F. L. Jackman, J. E. Lancashire, H. W. E. Lindo, C. S. Morley, H. Overnell, H. Savage, L. R. Stedman, W. L. Ward (Part I only), F. J. Watson.

THE SPECIAL EXAMINATION.—The Special Examination, qualifying for candidature as Associate R.I.B.A., was held in London from December 1 to 7, 1926. Of the 22 candidates examined 12 passed and 10 were relegated. The successful candidates are as follows:—J. A. Black, J. Creese, E. E. Edmunds, E. E. Fowler, C. W. Glass, J. Harrison, F. H. N. C. Kemp, A. F. Lodge, A. Lomax, C. A. L. Morant (Part I only), J. E. Salisbury, E. R. Taylor

EXAMINATION IN PROFESSIONAL PRACTICE FOR STUDENTS OF SCHOOLS OF ARCHITECTURE RECOGNISED FOR EXEMPTION FROM THE FINAL EXAMINATION.—The

Examination was held in London on December 7 to 9, 1926. 25 candidates were examined, all of whom passed. The successful candidates are as follows:—H. M. A. Armitage, A. V. Banks, H. A. Barton, Kathleen O. Brayshaw, A. D. R. Cowley, R. P. Cummings, W. R. H. Curtis, R. W. Elder, L. P. Ellicott, Sylvia C. Gray, Jessie M. Greig, R. G. Grice, Amy M. Hargroves, F. W. Harper, G. A. Jellicoe, H. A. Johnson, J. W. S. Monson, F. Napolitano, C. H. Short, J. F. L. de Silva, Zwi Sirotkin, A. Sleight, H. G. C. Spencely, A. C. Todd, J. B. Wride.

THE SPECIAL EXAMINATION IN DESIGN FOR FORMER MEMBERS AND CANDIDATES OF THE SOCIETY OF ARCHITECTS.—The Special Examination in Design for former Members and Candidates of the Society of Architects to qualify for the Associateship, was held in London from December 1 to 6, 1926. Of the 2 candidates examined, 1 passed and 1 was relegated. The successful candidate is as follows:—J. Cannell.

ASSOCIATESHIP R.I.B.A. AND OFFICE EXPERIENCE.—The attention of candidates for the R.I.B.A. Final Examination is called to the fact that no successful candidate will be admitted to candidature as Associate without having had at least one year's experience in an architect's office or in building work and/or in a builder's office, or in gaining knowledge of the practical side of building.

Ulster Society of Architects (Inc.)

A report and statement of accounts which showed a record year of progress were presented at the twenty-fifth annual general meeting of the Ulster Society of Architects, held in the rooms of the Society in the Scottish Provident Buildings, Belfast, Mr. John Seeds presiding. These were unanimously adopted, on the motion of Major James Ferguson, seconded by Mr. D. W. Boyd. In a discussion on the work of the Society, in which the President, Major Ferguson, Mr. R. I. Calwell, Mr. C. Love, and Mr. R. H. Gibson took part, the following subjects were reviewed:—Registration of the professional local building by-laws, town planning, and the general question of the spoliation of the countryside. The election of officers and council for the year 1927 resulted as follows:—President, John Seeds; vice-president, Major J. Ferguson, F.S.I.; hon. treasurer, Thomas Eagar, M.R.I.A.I.; hon. secretary, R. H. Gibson, M.R.I.A.I.; council—D. W. Boyd, M.R.I.A.I.; R. I. Calwell, B.E.; E. R. Kennedy, A.R.I.B.A.; G. O. Neill, M.R.I.A.I.; J. P. M'Grath, M.R.I.A.I.; J. G. Smyth; E. W. Warne. The President announced that several matters of very great importance to the profession would be considered by the new council during 1927.

Scottish Architects

The monthly meeting of the Council of the Incorporation of Architects in Scotland was held recently at 15 Rutland Square, Edinburgh,—Mr. G. P. K. Young, F.R.I.B.A., president, in the chair. Rules and regulations of the Edinburgh Chapter, relating to affiliates, were approved. One Fellow and one Associate were elected. Reports were submitted by five of the Standing Committees. The prize of £15 for third year students was awarded to Mr. R. M. Noad, Glasgow School of Art. The question of the formation of a Council for the Preservation of Rural Scotland was considered, and approval was given for taking steps to convene a preliminary meeting with reference to the formation of such a Council.

The National Art Collections Fund Committee have decided to present the self-portrait bust by Roubiliac, recently purchased at auction, to the National Portrait Gallery.

A COMPARISON IN SCALE: THE BARCLAY VESEY TELEPHONE BUILDING AND ITS WEST STREET NEIGHBOURS.

THE BARCLAY VESEY TELEPHONE BUILDING, NEW YORK

By HOWARD ROBERTSON

PHOTOGRAPHS BY F. R. YERBURY

The New York Telephone Company, which has just dedicated its new building "to the service of millions of people in the semi-centennial year of the telephone," is the largest of the 25 associated companies which, with the present company, the American Telephone and Telegraph Company, comprise the great Bell System. The New York Company provides telephone service over the State of New York, a large portion of New Jersey, and a part of Connecticut. The population of the area which it serves is approximately 14,000,000, representing about 2,800,000 telephones, or one telephone to every five persons.

The history of the New York Telephone Company has been one of steady development, with a consequent increase in volume of work and number of employees, as thousands of new telephones are added

annually to the system. At the end of 1925, the four was a great demand for new telephone and pipe ducts, the company was faced with supplying a "core" of an in its headquarters' building which allows all the external obtain new quarters in New York City. It was as a result of this "core" to it was realised that in the case of the main block town Manhattan, that the idea of ascertaining and working plans for development in view of the McKenzie, Voorhees, and Worey, but which permitted the land thoroughfare to be continued up without height which give their name to the building stands at the tower at 29 stories. The mid-Manhattan—in the tower was, of course, limited where money is made the height and area that can be

THE BARCLAY VESELEY TELEPHONE BUILDING: DETAIL OF THE FACADE.

telephone service, which is its *raison d'être*, is the willing link between the two activities.

Considered purely from a dramatic point of view, the situation of the building is magnificent. Inland, particularly from Vesey Street, it rises with a precipitous piling up of masses which are so successfully studied as to appear unconscious in their effect of power. Towards West Street, one end of which it seems almost to bestride, it offers the generous width of its flank, and the full effect of this broadside of sheer brickwork is enhanced by the comparative insignificance of neighbouring buildings. But it is from the Hudson River, particularly at night, that the Telephone building really comes into its own. Seen from a line through the river haze or from the ferries which scurry over to the Jersey shore, the towers of Manhattan stand like giants in some great Wagnerian Theat, all of them recognisable by their character-Bunce, tresses, not a few of them excelling in height W. H. Fordt, pile on West Street. But in sheer J. Goodall (some say a strength which suggests Graddon, R. N. Gugiant at the water's edge excels Jackman, J. E. Lambt it dominates over its near Morley, H. teature of the machine. The multiplication of its every unit bespeaks the necessity for standardisation and for design on the basis of repetition.

The bars in the grillage of the foundation, the stanchion bases, the joists and columns and floor slabs, the doors and windows and elevators and fittings, are all required in such quantity that any idea of method of individual craft production must at once be set aside. A building on such a scale can only be produced under economical conditions by the organised methods of a mass production; and yet, as the Telephone building shows, architecture can triumph over this so-called handicap, and show pride in the very factors which are so often deplored as sounding not only the death knell of the craftsman, but of the architect as well. On the contrary, such a building proves the value of both architect and craftsman in the strongest possible degree. Far from developing into a mere engineering problem, the skyscraper makes calls upon the utmost capacities of the architect as a planner in every measurable dimension, and as an artist handling form, not within the usual limits of canvas or marble, but in solids of Titanic vastness. There is planning requiring knowledge of science, of human psychology, of abstract form; there is decoration demanding harmony in colour and in material; there is business ability and the power of selection within the economic limits of the problem; and, lastly, there is geometric sculpture of mass on a huge scale calling to its assistance and relief every possible resource of free design in pattern, texture, and colour in every product which nature and human ingenuity can supply.

As for the craftsman, the call upon his services is more than ever urgent. First in the quality of his workmanship of the structure proper, and secondly in the development of the innumerable opportunities

A COMPARISON IN STYLE: THE ADJACENT BUILDINGS AT THE OTHER END OF WEST STREET.

THE BARCLAY VESEY TELEPHONE BUILDING: THE ARCADE.

which occur in the vast areas of such a building for the carver, the mosaic worker, the painter, and the metal worker. For although the Telephone building is a commercial structure, it resembles many other large American office buildings in the liberality of its decorative treatments. More and more, in fact, these great office blocks are tending to offer to the public something of the hospitality of the old-time Basilica. Corridors develop into wide and lofty halls, almost loungelike in their spaciousness, often complete with stalls and booths for the sale of newspapers and tobacco, and perhaps connected with the shops which are tenants of the ground floor space. In the Telephone building, in fact, one finds not only these amenities, but in addition the provision of a wide arcade which adds to the breadth of the street which it parallels, and adds at the same time to the attractiveness of the shops which give upon it.

THE PLAN.—The ground dimensions of the site are approximately 200 by 250, but the shape being a parallelogram instead of a rectangle has faced the architects with a difficult problem. Their solution has been to take up the central mass as a rectangle, ignoring non-parallelism, and trusting to bulk to overcome any uneasiness resulting from this conflict; it is probably the soundest way to face this difficulty, which is not unlike the problem of axis confronting the architects of Bush House in Kingsway. There are 32 floors above ground and five below the street level; there are also two stories in the roof tower. The whole utilisable floor space totals about 850,000 square feet, and the average population, when the building is in full occupation, would be about 6,000 people.

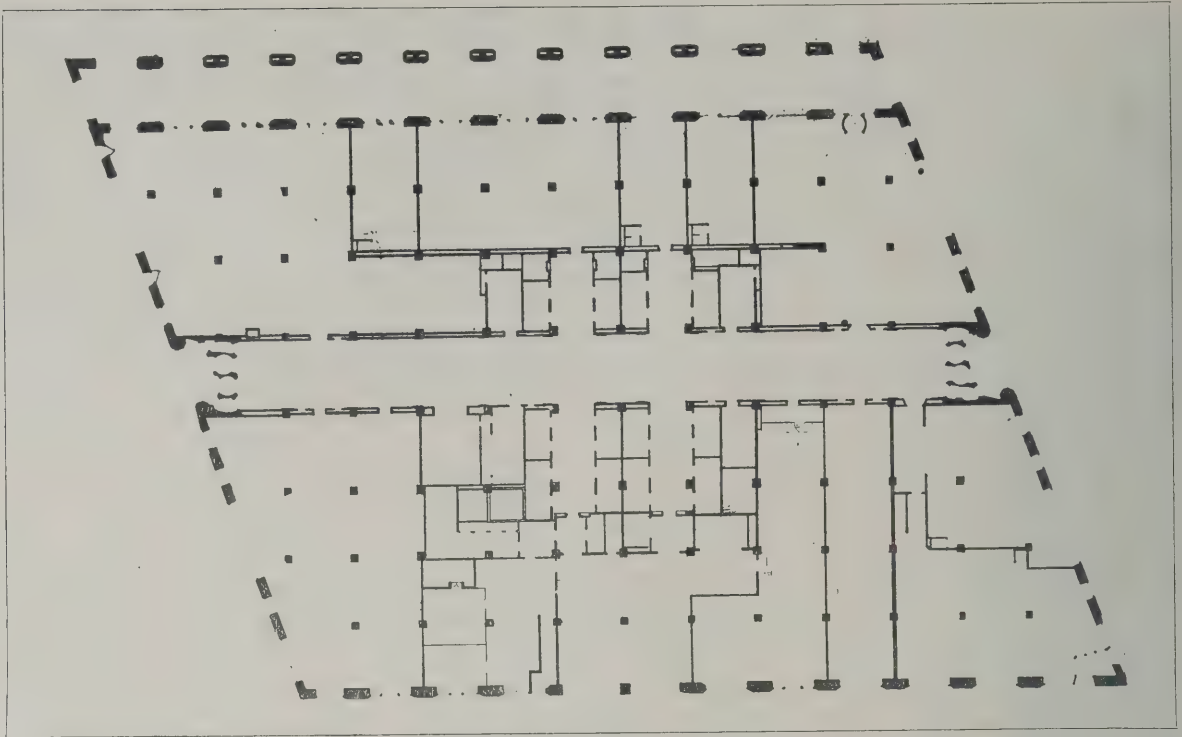

The first ten stories of the building are designed principally for utilisation as telephone exchanges, while the remaining stories, including those in the tower, are for administrative office purposes. There is space for six full-sized telephone exchanges capable of serving a total of 120,000 telephones. The main feature of the plan structure is its layout on the principle of a grillage at approximately 24-ft. centres,

and the arrangement in the centre of a block of lifts and other services. The remainder of the space is subdivided as required by partitions, which in the main respect the divisions of the structural unit.

Undoubtedly the most striking architectural element in the internal design is the main central lobby on the first floor (anglicé ground floor), extending right across the building and giving access to cross lobbies, off which are the batteries of lifts. Its walls and floors are of Travertine (slightly channelled in the case of the walls), and the skirting and surrounds are of Levanto marble. The ceiling is in the form of a flat segmental vault 25 ft. high, with a series of small penetrations at the springing in which are set electric lights. There are in addition two main chandeliers of very original modern design consisting of a series of bulbs in tubes, which reflect on to a central octagonal drum, whose facets are covered with designs in perforated metal. This main corridor is one of the most effectively treated of any modern American commercial building.

A feature of the internal arrangement is the fact that the central area, containing the lifts, the four escape staircases, the boiler flue, vent and pipe ducts, and lavatory units, is totally self-contained within fire-resisting walls; it thus forms a "core" of an area of about 100 by 100, and allows all the external wall space to be developed for office space with natural light. The relationship of this "core" to the total area of each typical floor is about 1 to 4.6.

Designs were originally prepared for buildings of varying storey height, with the idea of ascertaining the most economic height development in view of the New York Zoning Ordinance, which required a major set-back at the 18th storey, but which permitted the tower portion to be continued up without height limitation. It was found that the lowest cost per square foot was reached in the case of the main block at 16 stories, and for the tower at 29 stories. The economic height of the tower was, of course, limited to some extent by the height and area that can be

THE BARCLAY VESEY TELEPHONE BUILDING: FIRST FLOOR PLAN.

served by one bank of lifts. When the height of the tower reaches such a point that an additional lift is required, the loss of space resulting from the shaft reduces the available rentable area, and thus increases the cost per super-foot unit. Generally speaking, it seems to be an American practice to average one lift for every 20-30,000 ft. of floor area to be served. In the Telephone building there are 24 lifts arranged in four banks, with three additional lifts for special purposes, an average of lifts per square foot of approximately 1 to 30,000.

The main basement floor, to which lifts descend, contains a cafeteria and a dining-room affording facilities for the service of 2,000 meals per hour, with, of course, fully-equipped kitchens. In connection

with the dining-rooms are further rooms for recreation and rest.

SERVICES.—From the point of view of the services, the building is divided into two independently operated units, the first consisting of 17 stories and two mezzanines and the second of 15 stories and one mezzanine, comprising the tower covering an area of about 108 by 116 feet. The 17th floor mezzanine operates for the tower in the same way as the basement for the lower portion of the building, and with the exception of the heating and pumping apparatus contains all the equipment usually found in a basement. At the same time, it contains for the lower portion of the building the equipment which is normally housed in the roof. The advantage of the

THE BARCLAY VESEY TELEPHONE BUILDING: BASEMENT PLAN.

THE BARCLAY VESEY TELEPHONE BUILDING: UNDER THE ARCADE.

The great depth of the radiating voussoirs and the treatment of the vaulted surfaces are particularly interesting.

THE BARCLAY VESEY TELEPHONE BUILDING: SEVENTEENTH FLOOR PLAN.

arrangement is that all the equipment can, if desired, be combined, or the tower section can serve the lower section, while in the normal course the two would be operated separately. There is an obvious economy in cases where only a portion of the building is in complete occupation.

The electrical equipment is extremely comprehensive, including wiring and connections for light, direction signs, ventilating fans, pumps, heat control, communication, and vacuum cleaning. The wiring layout is generally uniform without regard to particular office requirements, but outlets in the stanchions are kept to one side so as not to interfere with partitions which would normally be set out from stanchion centres.

Three vacuum-cleaning turbines are provided in a sub-basement, and there are outlets throughout the building, including the telephone exchange rooms, arranged so that the maximum hose length required will not exceed 75 feet.

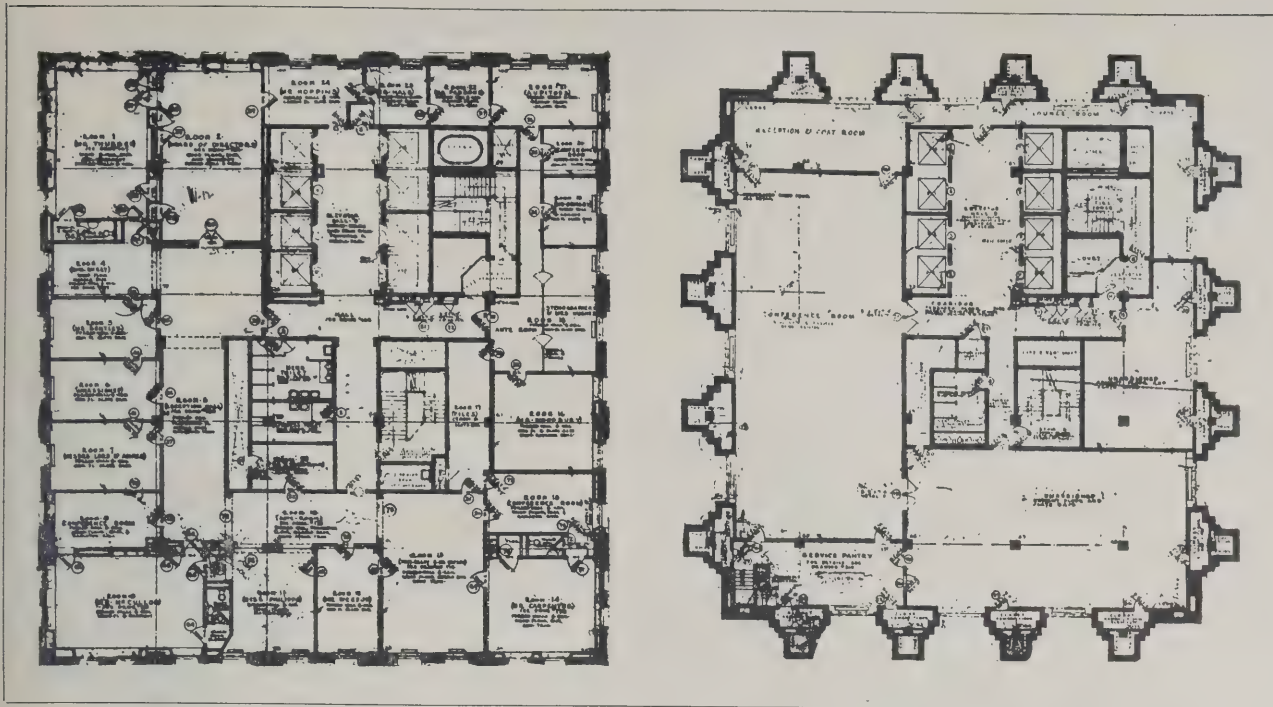

The heating system is of the two-pipe vacuum type with steam-driven vacuum pumps. There are four boilers, fed from an overhead coal bunker, and provision has been made for the use of oil fuel if desired. There is complete supply and exhaust ventilating

up to the tenth floor, and the internal toilets are ventilated by utilising the plumbing shafts as vent ducts. A main exhaust fan on the 32nd storey discharges air from these shafts at the rate of about 100,000 cubic feet per minute.

The lift equipment, which has already been mentioned, has been studied from the point of view of minimum loss through acceleration and retardation. As is the modern American practice, the lifts have "micro-levellers," which level the lift with the floor which is being served and maintains the car in position as long as the doors are open. During rush hours a car leaves the ground floor every five seconds, and more than 180 passengers are handled per minute. Such intensive service naturally requires the presence of a lift "captain" or despatcher, and his office on the ground floor contains a complete control board and indicators showing the position and direction of travel of every lift. A building of this type in America would, of course, not be considered complete without the usual additional services of cooled drinking water and supply of liquid-soap for the lavatories. In the Telephone building the soap-dispensing system is ingeniously incorporated with the lift

THE BARCLAY VESEY TELEPHONE BUILDING: DETAIL OF ENTRANCE.

THE BARCLAY VESEY TELEPHONE BUILDING: THE TWENTY-NINTH AND THIRTY-FIRST FLOOR PLANS.

for the lavatory basin wastes, the three soap-storage tanks being on the 8th, 17th and 32nd stories.

EXTERNAL FINISH.—The exterior of the building is in a light shade of buff brick, laid in cement with a $\frac{1}{2}$ -in. joint, and a dampcourse occurs over all window openings above the first floor. The lintels, sills and decorative trim is of limestone, and exposed caps to piers, etc., are covered in sheet copper bonded to the steel frame, to protect from water and lightning.

The carving and detail of the external work, as of the interior, is beautiful both in design and execution. There is in the flat relief of the stone carving more than a hint of Eastern influence; but perhaps the strongest kinship is with the intricately patterned design which was being so interestingly developed by the late Louis Sullivan.

Sullivan exteriorised his own theories. Of the influences operating in the design of the ornament of the Telephone building we can only surmise; but the result is worthy of this great building, of which Joseph Pennell wrote: "Study it from the streets that surround it. Thus you will learn that great things are being done in the city after all."

The Preservation of Building Stones

Building Stones: Their Properties, Decay and Preservation. By Arthur R. Warnes. London, 1926. 269 pp. (Ernest Benn, Ltd.) 16s. net.

Stone Decay and Its Prevention. By J. E. Marsh. Oxford, 1926. 58 pp. (Basil Blackwell). 3s. 6d. net.

Concurrently with the publication of the official *Memorandum on the Defective Condition of the Stonework at the Houses of Parliament* (H.M. Stationery Office, 1s. 3d. net) come two new books on the preservation of building stones, wherein the subject has been dealt with in a manner understandable by those who have but little knowledge of the chemistry and physics concerned. Mr. Warnes introduces his subject from the geological aspect, dealing with the structural character of rocks and the natural processes by which they have been formed. From this he passes to a more detailed description of a large number of building stones arranged in alphabetical order to facilitate reference, but grouped in separate categories as limestones and sandstones,

marbles and granites. Here the chemical composition of the stone and its chief physical properties have been tabulated as a means of comparing the various species, and a wealth of notes is included on working qualities, the possibilities of decay and the manner of it. Where possible illustrations are given to show the texture of the stone, some of them being taken under the microscope. Coming to the cause of decay, the various physical and chemical processes responsible are fully discussed, and whilst atmospheric pollution receives its fair share of the blame, the effect of wind and rain, expansion and contraction from variations in temperature, pressure brought about by molecular changes in the stone and by the expansion of water due to freezing, are not overlooked. The concluding chapters concerning preservation and restoration are very informative, and should be read by all who hold the care of our historical buildings as sacred trusts, as well as by those who employ stone as their principal building material, for even though care be exercised in the selection of a particular stone for some particular situation, the elements as well as artificial agencies have to be contented with.

In the little treatise by Mr. Marsh, stone decay is regarded as a disease which may be treated surgically or therapeutically, or eliminated by methods of prevention. The author condemns the surgical treatment, and of wire-brushing he says that "no building should be allowed to get into such a state as to require it." From the results of his researches he concludes that decay in stone is primarily due to the action of micro-organisms bringing about certain nitrifying processes which ultimately break up the surface of the stone so that it becomes more susceptible to the action of wind and rain. Several arguments are advanced in support of this theory, the chief being the presence of nitrate in the decayed stone, and, as a remedy, processes which tend to raise the alkalinity of the stone—such as the application of lime-wash or cement wash—are claimed to be the most successful. In this connection it is interesting to note that the author regards the action of bacteria at the surface of the stone as being comparable to that of bacteria in the soil, and that by raising the alkalinity of the stone the latter becomes sterile just as alkaline soil is sterile.

LEGISLATION OF 1926

Which will Affect Architectural and Building Practice

The annual output of the Statute Factory at Westminster has of late years approached proportions of enormity, and legal practitioners and others directly concerned are faced with an increasingly difficult task when the new laws are enacted partly by statute and partly by a conglomerated mass of Rules, Orders and Regulations as seems to be the regrettable practice, nowadays. Whilst hardly equalling the far-reaching and bewildering batch of Acts of 1925, which included the new Law of Property Group, the year just ended is nevertheless responsible for one or two Statutes of importance to architects and builders. Amongst these the following may be selected:—

LEAD PAINT (PROTECTION AGAINST POISONING) ACT, 1926.

This Act brought into force on January 1, 1927, quite new provisions affecting those engaged in the painting of buildings, and master painters, master builders, and others employing persons in painting buildings, whether lead paint is used or not, should make themselves acquainted with the new duties imposed upon them. The Act itself has not, up to the time of writing, been published by the King's Printer, but the Home Office has issued a circular and a draft set of regulations which give full directions as to what should be done for the moment. The provisions of the Act apply not only to persons actually employed in painting, but also to those employed in any way in connection with such painting *and whether he uses lead paint in his work or not.*

The duties imposed upon employers include:—

- (a) Supplying to the Local Factory Inspector particulars of name and address of office;
- (b) Keeping a Register at such office of the persons employed on painting buildings and the work on which they are employed;
- (c) After November 18, 1927, no woman or young person under 18 must be employed on painting any part of a building with lead paint—this prohibition does not apply to any woman so employed at the passing of the Act, or to a young person employed as an apprentice under approved arrangements.
- (d) Giving notice at once to the Factory Inspector and to the certifying surgeon if a case of lead poisoning occurs among his employees.

Although the Act itself came into force on December 15 last, the date of the coming into force of the Regulations made thereunder has not up to the moment of writing been fixed.

The duties placed on persons employed in or in connection with painting buildings or liable to come into contact with lead paint are:—

- (1) Overalls must be worn during the whole of the working period and shall be washed at least once per week.
- (2) Clothing discarded during working hours must be deposited so as to prevent it being soiled by lead paint.
- (3) Hands must be carefully cleansed and washed before each meal time and before leaving work.
- (4) Presenting himself for medical examination when so required by the Chief Inspector of Factories.

The enforcement of these Regulations is placed within the jurisdiction of the Inspectors of Factories to whom the necessary facilities must be given, and they have the same powers of entry and inspection

as they have under the Factory and Workshops Acts, including power to take legal proceedings.

LAND DRAINAGE ACT, 1926.

This is an Act to amend the Land Drainage Act, 1918, and to transfer the power of the Minister of Agriculture and Fisheries under that Act to councils of counties and county boroughs. The provisions of Section 2, which are new, enact that where any drain—and in this term are included streams, ditches, drains, cuts, culverts, dykes or sluices—is in such a condition that the proper flow of water is impeded then, unless the condition is the result of subsidence due to mining operations, it shall be the duty of the person having control of the drain to put it into proper order if, by reason of such impediment, agricultural land belonging to or in the occupation of some other person is injured by water or in danger of being so injured. Where a county or county borough council are of opinion that such a state of affairs exists, it may serve a notice on the person having control of the drain calling upon him to put it into proper order. There are also provisions whereby any persons considering himself aggrieved by the service of such a notice may complain to a court of summary jurisdiction.

It would rather seem that these provisions are confined in their application to agricultural land. It is conceivable, however, that circumstances might arise necessitating the invocation of the provisions of Section 2 to land other than agricultural, for instance, where an owner of agricultural land desires to develop it for building and is hampered by a condition of affairs contemplated in the section, although the complaint would probably have to be lodged in respect of the agricultural land as such. Again, in these days of the tendency to erect country residences in agricultural districts, it might well be that an agricultural area which includes the site of buildings, is injuriously affected by the neglect of a drain on an adjoining property, and whilst the area as a whole can still be agricultural land, the provisions of Section 2 could be invoked for the benefit of the buildings also.

TITHE ACT, 1925.

Important amendments are made by this Act in the law relating to tithe rent charge which will prove of interest to builders and others who, as owners, are interested in the development of agricultural land as building estates. The Act operates mostly from "appointed dates." The principal provisions are (a) the transfer to Queen Anne's Bounty of ecclesiastical tithe rent charge; (b) the stabilisation of the annual value of tithe rent charge at £105 per cent.; and (c) the synchronising of the dates for payment of the rent charge. Where the dates for payment are other than April 1 and October 1, the dates for payment shall be those dates. It is anticipated that (a) and (b) will not come into force until March 31, 1927, but (c) came into force on the passing of the Act, namely, December 22, 1925.

Section 4 provides for the extinguishment of the tithe rent-charge vested in Queen Anne's Bounty at the expiration of 85 years, by the payment into a sinking fund of an additional annual sum of £4 10s. in respect of every £100 of tithe rent-charge so vested, and great care seems to have been exercised to prevent such additional sums from being treated as annual charges in respect of which deductions might be made for income-tax purposes.

Provision is made by Section 17 for the redemption of lay tithe rent-charge which came into operation on

STUDIO FOR SIR BARRY JACKSON, BLACKHILL, HERTFORDSHIRE.
OLIVER HALL, F.R.I.B.A., Architect.

December 22, 1925, and various miscellaneous amendments which came into operation on February 22, 1926, are made by Sections 18 to 23, principally relating to apportionments and deductions for rates and land tax on redemption.

EXPIRING LAWS ACT, 1926.

This is the usual annual Act to continue certain expiring laws, the only one of interest to architects being Section 25 of the Housing, Town Planning, etc., Act, 1919, which, it will be remembered, gives power to local authorities to disregard or relax any bye-laws, and consent to the erection and use for human habitation of any buildings erected or proposed to be erected in accordance with any regulations made by the Local Government Board. They may attach to their consent any conditions as to sanitary arrangements and protection against fire of such buildings which they may deem proper.

This section has been continued until December 31, 1927, when it shall expire unless further continued, but it is fairly safe to conclude that it will be further continued until the existing housing problems are solved.

LAW OF PROPERTY (AMENDMENT) ACT, 1926.

This Act amends not only its 1925 namesake, but also other statutes forming the group previously mentioned, and removes several anomalies which came to light when these Acts were applied in practice. There is a long schedule of what are termed "minor amendments," the majority of which only concern the legal practitioner and need not be considered here, but a few of the more important amendments of interest to the layman might well be mentioned. One of the effects of Section 1 of the Settled Land Act, 1925, in carrying out the general scheme of the Acts, was to make land which had been conveyed to a purchaser by a tenant for life under a settlement subject to but indemnified against certain family charges, settled land under a compound settlement involving, in some cases, the appointment of trustees, but in every case the payment of the purchase money to not less than two trustees, thus preventing the vendor who had paid his own purchase money from handling his proceeds of sale. One of the kinds of transactions to which this provision applied was where land had been bought from a tenant for life for development or immediate building. Owing to the extensive selling of family estates since the War, the vast majority of

which were caught by this section, development came to a standstill all over the country, and real hardship thrown upon builders who, on selling the houses they had erected, could not receive their purchase moneys. This grave defect has now been removed, and although such land is still "settled land," nothing contained in the section before referred to shall prevent a pre-1926 purchaser for value from selling the land as if it had not been settled land. This is, in effect, a return to the position before 1926. The family charges are still there, covered by the indemnity, but the land can be dealt with like ordinary unsettled land, the only condition being that it must have been purchased for value.

The vesting provisions of the Law of Property Act, 1925, had some curious results, notably where a man purchased land and had it conveyed in his wife's name. On January 1, 1926, all land which had been conveyed to a nominee or trustee vested automatically in the person who had provided the purchase money, so that although as in the instance cited the deeds would show the legal estate to be in the wife, she had, in fact, no estate at all. This caused serious difficulties and necessitated all kinds of seemingly absurd inquiries on the part of a purchaser's solicitor, with the result that the amending Act says in such cases, if a purchaser had no notice of a trust and the deeds are produced by the person in whom they show the legal estate to be vested, he is safe in taking his conveyance from such person.

Another useful amendment affects land held jointly. All land vested in more than one person jointly is now held by them as trustees for sale but not interfering with their beneficial interests (if any) in the proceeds of sale, and there must always be not less than two trustees and not more than four. Difficulties again arose in cases where two persons or, to take the usual instance, a husband and wife, held land jointly and beneficially, for on the death of one, although the survivor would take the entirety for his or her own benefit by virtue of survivorship, the land could not be sold until a second trustee had been appointed to give a joint receipt for the purchase money. This would involve needless expense, so now, on the death of one of them, if the survivor is solely and beneficially interested, he can deal with the land in the ordinary way. It should be borne in mind, however, that the foregoing does not apply where land is held by more than one person in shares, either equal or unequal.

Competitions Open

BIRMINGHAM CIVIC CENTRE

Competitive plans are invited, not only from this country but abroad, for the development of the future civic centre of Birmingham around the Hall of Memory. The assessor is Mr. H. V. Lanchester, F.R.I.B.A. First premium £1,000 and a further sum of £1,000 will be divided among other competitors on the recommendation of the assessor. Sending-in day, June 30, 1927. Conditions can be seen at this office.

LEAGUE SECRETARIAT AND ASSEMBLY HALL, GENEVA

Full particulars of this competition were published in our issue of August 13, 1926. Designs must be dispatched not later than January 25, 1927, and all plans reaching the Secretariat after March 31, 1927, will be disqualified.

INCORPORATED ARCHITECTS IN SCOTLAND

This competition is open for the Rowand Anderson Medal and £100, for a City Art Gallery and Museum; the Rutland prize of £50 for Study of Materials and Construction; prizes of £10 to £15 for Third Year Students in Scotland and a Maintenance Scholarship of £50 per annum for three years. Particulars from the Secretary of the Incorporation, 15 Rutland Square, Edinburgh.

PETERBOROUGH MUNICIPAL COMPETITION

In connection with the £200,000 scheme to widen Narrow Street, Peterborough, the Peterborough Town Council are considering proposals for the provision of municipal buildings on the upper floors, and at the rear of the new premises to be erected in the newly constructed street. The Council propose offering a prize of 250 guineas for the best plan submitted. A second prize of 100 guineas, and a third prize of 50 guineas will also be offered. The city engineer estimates that the erection of shops and offices will cost £82,800, and the erection of municipal buildings and shops £158,308.

NEW TOWN HALL AND LIBRARY, LEITH

Conditions and plans for this competition are being prepared. Assessor, Sir George Washington Browne, R.S.A. Particulars from City Chambers, Edinburgh.

RAWMARSH MEMORIAL

The Rawmarsh and Parkgate War Memorial Committee invite architects to submit designs for this Memorial. The cost, inclusive of fees, not to exceed £2,000. The successful competitors will be invited to act as architects for the erection of the Memorial. A plan of the site may be obtained from Mr. J. A. Tonge, L.R.I.B.A., Surveyor's Office, Parkgate, Yorkshire.

Fig. 43. THE HEARTS OF OAK BENEFIT SOCIETY BUILDING, EUSTON ROAD, LONDON: AN EFFECTIVE EXAMPLE OF MODERN FLOODLIGHTING.

LIGHTING INSTALLATION DESIGN

XI.—Floodlighting and Sign Lighting

By AN ILLUMINATING ENGINEER

There is no more successful way in which to bring an important or impressive building into prominence at night-time than by the application of exterior floodlighting.

In pre-war days the decorative lighting of buildings was largely limited to festive occasions, but the last few years has seen the introduction of flood and decorative lighting for publicity purposes, such lighting being in continual operation over lengthy periods. The immense possibilities of this system as an advertising proposition have long been appreciated by many of our modern stores and commercial houses, and in a previous article brief reference was made to the lighting of the Selfridge building and the Army and Navy Stores as being typical of what has already been achieved in this direction.

By courtesy of the management, we are now able to refer to the floodlighting at the Hearts of Oak Benefit Society Building, Euston Road, London. This installation comprises nine special projector units, used in con-

junction with 1,000 watt lamps mounted some 40 ft. forward of the building to illuminate the entire frontage of 130 ft. (Fig. 43). Here the lighting effect is considerably enhanced by the fact that the building stands in its own grounds, and is therefore emphasised against a dark background.

Fig. 44. A TYPICAL FLOODLIGHTING EFFECT OBTAINED WITH 8-10-WATT PROJECTOR UNITS.

There is no doubt that such buildings standing in their own grounds present the easiest propositions for effective floodlighting, as it is then possible to bring the lighting units well forward, enabling large expanses to be treated with a small number of units and with a much higher illumination efficiency due to the light striking the surface at a more normal angle. At the same time it will be appreciated the advantage this method has in reduced distortion by shadow in comparison with the "close-up" methods of floodlighting, although it is not always possible to find such favourable conditions, and it may be necessary to take full advantage of local conditions for the attainment of the desired results. Verandahs and covered ways,

however, where they exist, should always be used to advantage for the attainment of greater distance, or, in extreme cases, projection from opposite or adjacent buildings may become possible.

In some cases advantage may be taken of the fact that the frontage to be treated is on a new building line, and it is therefore possible to attach the projector units to the corners of the older buildings on either side in order to gain several feet in projecting distance. To this end, in the future we shall probably see special provision made in the general design of the building for floodlighting treatment, either by suitable recesses or projections, or by the introduction of concrete columns or posts in line with the kerb from which the projection of light can be effected. The extension of this floodlighting system to exteriors in our shopping centres will then go far to alleviate the problem of "glare" in the streets, as the contrast between high candle-power street lamps and the relative dullness of adjacent buildings will thus become considerably modified.

Apart from its more-or-less commercial applications, floodlighting has an almost inexhaustive field in the lighting of Town Halls and Municipal buildings; at the same time, there are many centres of architectural interest in most of our cities which could be brought into greater prominence by its use. An installation of some interest along these lines is to be seen in the War Memorial at the approach to Euston Station. This memorial, which occupies a central position, is surrounded by a number of specially designed standards, at the top of which is arranged a laurel wreath and from the sides of which two arms project horizontally. The centre apertures are here fitted with floodlights which are trained on to the memorial, whilst refractor units for lighting the roadway and approach are attached to the arms.

FACTORS INVOLVED IN FLOODLIGHTING.—Apart from the desirability of having a reasonable distance from the plane to be treated, the successful solution of a floodlighting problem depends upon the following factors:—

1. The brightness of the installation.
2. The type of equipment.
3. The total energy required (dependent on Item 1).

1. Brightness of Installation.—In all classes of floodlighting the object illuminated must stand out from its surroundings. It is therefore necessary to consider the brightness of adjacent buildings before a suitable lighting intensity is determined. It should also be borne in mind that the brightness of a frontage

will depend upon its reflective properties. A grey surface having a reflective value of 20 per cent. will require four times the light to appear equally bright as a white surface of 80 per cent. reflectivity.

2. The Type of Equipment.—It is now possible to procure a range of floodlighting projectors to meet the requirements of various schemes. In the main, these projector units come under two classifications: (a) those suitable for light projection from a distance, in which case the light rays are confined to a relatively narrow angle; and (b) those which give a wider light distribution curve.

SIGN LIGHTING.—It is being forced more and more on the minds of those interested in this form of lighting that in our modern commercial buildings a provision will need to be made for the banal subject (to them) of publicity. As the matter stands to-day artistry is eagerly sought for by commercial houses, and in that connection all the conditions of commerce render it absolutely essential to utilise such buildings to some extent for publicity purposes, with the result that many buildings are plastered indiscriminately with a variety of publicity matter whereas this could be overcome by the provision of panels, etc., to which advertising could be blended much more satisfactorily with the building than

Fig. 45. FLOODLIGHTING COMBINED WITH PUBLICITY AT THE NEW UNDERGROUND STATION, MORDEN.

it is at present.

In this respect floodlighting is found to possess wide possibilities for localised treatments, and it is interesting to note that the Underground Railways have applied floodlighting to the lighting of many of their station nameplates with considerable success, and in many cases with much less energy than would otherwise have been necessary with the box-type of illuminated sign. (Fig. 45).

Day and Night Signs.—A very material advance over the ordinary electric lamp sign in the attainment of bold and artistic effect has been achieved by the new "Franco" day-and-night signs. In this new innovation the sign appears in the day time as a gilt wood letter sign, whilst at night it becomes transformed into an electric sign in which the letters are outlined in colour in a most effective manner. The development of this system will undoubtedly go far to quell the disfavour in which the ordinary lamp sign is frequently held, as it is in more direct conformity with the fundamental principles of good lighting. This new type of sign also lends itself to the treatment of shop facias. Not only does such lettering present a dignified result, but it is equally pleasing at night time by reason of its direct appeal and the richness of the colour effect produced.

New Ways and Means

*The Editor will welcome early information of
New Plant, Materials and Fittings*

An Improvement in Rolling Shutters

A patented rolling shutter, embodying several new features, which are claimed to overcome the disadvantages of the ordinary rolling shutter, has just been placed on the market by Messrs. E. Pollard & Co., Ltd., of St. John Street, Clerkenwell, E.C.1. This shutter, which is known as the "Rolador," is constructed on the interlocking principle with laths of 14 gauge cold rolled steel, and is made in two models—a standard one, where the lath is designed to throw off the rain, and a fire-resisting one, with the lath fitting tightly against the groove flange so that flame cannot creep through. The shutter itself coils upon hexagonal boxes, and the laths vary in width, the narrowest being fitted at the top so that each lath when coiled fits down correctly upon the lath beneath it. In this way although the new laths are twice as thick as those of an ordinary interlocking shutter, a coil of approximately the same size is obtained. The hexagonal boxes revolve on roller bearings instead of plain end bearings and these are designed to distribute the weight along the steel rod which supports the interlocking laths. This supporting rod is also mounted on sliding end bearings, which allows the first and last of the laths to fall into the grooves of the framework with equal smoothness, whilst the hexagonal boxes are provided with tempered and polished steel springs to assist in balancing the shutter in any position. "Rolador" parts are standardised and are pressed out of the solid with dies, the laths being turned up cold by special machinery. The complete units are given one coat of protective metallic

paint before leaving the works, this paint forming a suitable base for any finish subsequently desired.

The "Rolador" Patent Steel Rolling Shutter.
(E. Pollard & Co., Ltd.)

Luminous House Fittings

Messrs. Allardstown & Co., of 51 Westow Street, Upper Norwood, S.E.19, are now applying the luminous properties afforded by radio-active compositions to a variety of house fittings, such as electric-light switches, keyholes, house number plates, etc., which are not easily distinguished in the dark. For the electric-light switches they are manufacturing ground-glass covers, coated on the inside with the self-luminous preparation, which may be fitted to the switch in place of the usual metal or ivoride cover using a screwed metal collar. Keyholes may be indicated by means of crescent-shaped plates coated with the luminous preparation and suitably protected against deterioration in contact with the atmosphere. House name and number plates are built up from the individual letters and numerals, which may be obtained in standard sizes from 1½ in. to 6 in. high, the complete name being assembled in metal frames to assist in fixing. The luminosity of these "Spook" Radio-Active Utilities is guaranteed for a period of four years, the compositions employed being self-luminous, in contrast to the ordinary luminous paints which only retain their luminosity by periodical exposure to daylight.

Two New Wallboard Products

Two new wallboard products have just been introduced by Messrs. The Upson Co., of 8 Southampton Row, London, W.C.1. Upson Board (the first product, which may be identified by its blue centre) has a matt surface, and can be supplied in four standard thicknesses, varying from ½ in. to ¾ in., in panels 36 or 48 in. wide and from 6 to 16 ft. long. Each panel is kiln-cured to take out excess

moisture and to minimise expansion and contraction. It is also waterproofed with an oil-gum mixture in place of the more usual paraffin-wax, the latter being detrimental to the application of paint and enamel, which is liable to peel off and to take on a yellowish tinge. To a certain extent the board is, therefore, already sized for the application of a decorative coating, 1 gallon of flat paint covering an average of 75 square yards. Upson Fibre-Tile (the second product) is a special Upson Board with a hard, smooth, lintless surface, which is processed for the application of enamel and marked with deep tile-like indentations. It can be supplied in two patterns—with oblong tiles 1½ in. × 4 in., or square tiles 4 in. × 4 in.—both patterns being made in panels 48 in. wide and from 6 to 16 ft. in length.

Locating the Missing Key

An ingenious device which provides for an organised method of locating keys, tools, directories, etc., which may be used by a number of persons in an establishment, has recently been introduced by Messrs. The Locator Manufacturing Co., Ltd., of 5 Duke Street, Adelphi, London, W.C.2. In the ordinary way such articles are made accessible for general use by being suspended from hooks or placed on shelves, and when removed no indication is left to show who has taken them. The Locator System, however, obviates this in that each article is directly suspended from a box-like fitting (secured to the wall), from which it cannot be removed until a numbered token has been inserted in the Locator to indicate who has taken the article. Our illustration shows one of these Locator fittings with a key suspended from it and token-holder No. 6 about

The "Rolador" Shutter: Details of Construction.
(E. Pollard & Co., Ltd.)

The "Rolador" Shutter: Details of Construction.
(E. Pollard & Co., Ltd.)

to remove the key. When No. 6 has inserted his token in the Locator, the plug (L) with the key permanently attached to it is released, whilst the token itself is locked in the Locator to indicate who has removed the key. When No. 6 returns the key his token is automatically released, but should another token-holder require the key whilst it is still in the possession of No. 6, he may insert his own token in the lower slot of the Locator (from which the plug bearing the key was removed) and thereby release token No. 6, which may be taken to token-holder No. 6 in exchange for the required key, the newly inserted token meanwhile remaining locked in the Locator. By this means "distribution" and "re-distribution" of any particular article can be automatically effected, without losing trace of the article in question. This system, once adopted for ordinary keys, can be adapted to other uses, and one which commends itself to warehouses where wastage of electric current is entailed through the accidental leaving on of the lights provides for an electric switch operated by a key. When not in use this key is attached to a Locator

The "Locator" Fitting.
(The Locator Manufacturing Co., Ltd.)

it is also possible to obtain a certain amount of interheating between the adjacent coils, so that the element will glow and give off radiant heat under the influence of a current which would hardly cause the wire to glow with an electrical element of the ordinary type. In other words, it is possible to reduce the current consumption from 4,000 watts, or 4 units per hour, to 1,600 watts, or just over 1½ units per hour, and yet obtain the same heating effect desirable for a room of 4,000 cubic feet capacity. From our illustration it will also be seen that the whole of the heating element can be placed in the focus of the reflector, whereas with the ordinary type of "bowl fire" only a very small portion of the element is within focus, the remainder being spread over an elongated bobbin over which the wire is usually wound. Our second illustration shows the Standard Model "Meracol" Screen Fire constructed on these lines and rated at 600 watts.

The "Meracol" Electric Fire.
(The Thermo Path Co., Ltd.)

fitting, from which it can only be removed by the insertion of a numbered token. The switch key, however, cannot be removed from the electric-light switch without cutting off the light, and not until it has been duly replaced on the Locator will the user be able to retrieve his token, which, if he should carelessly leave the lights in use, will immediately reveal his identity.

An Improvement in Electrical Fires

A more economic type of heating element is being used in a new series of electric fires introduced by Messrs. The Thermo Path Co., Ltd., of 59 New Oxford Street, London, W.C.1. This element is arranged in the form of a double helical winding, which is held together by means of cement in place of a complicated system of supports, which must necessarily screen part of the coil and reduce its radiating efficiency. By winding the spiralised wire, as such, into a second spiral (see illustration)

An Anti-Glare Lighting Unit

Our illustration shows one of the latest Biflector Fittings for eliminating glare, introduced by

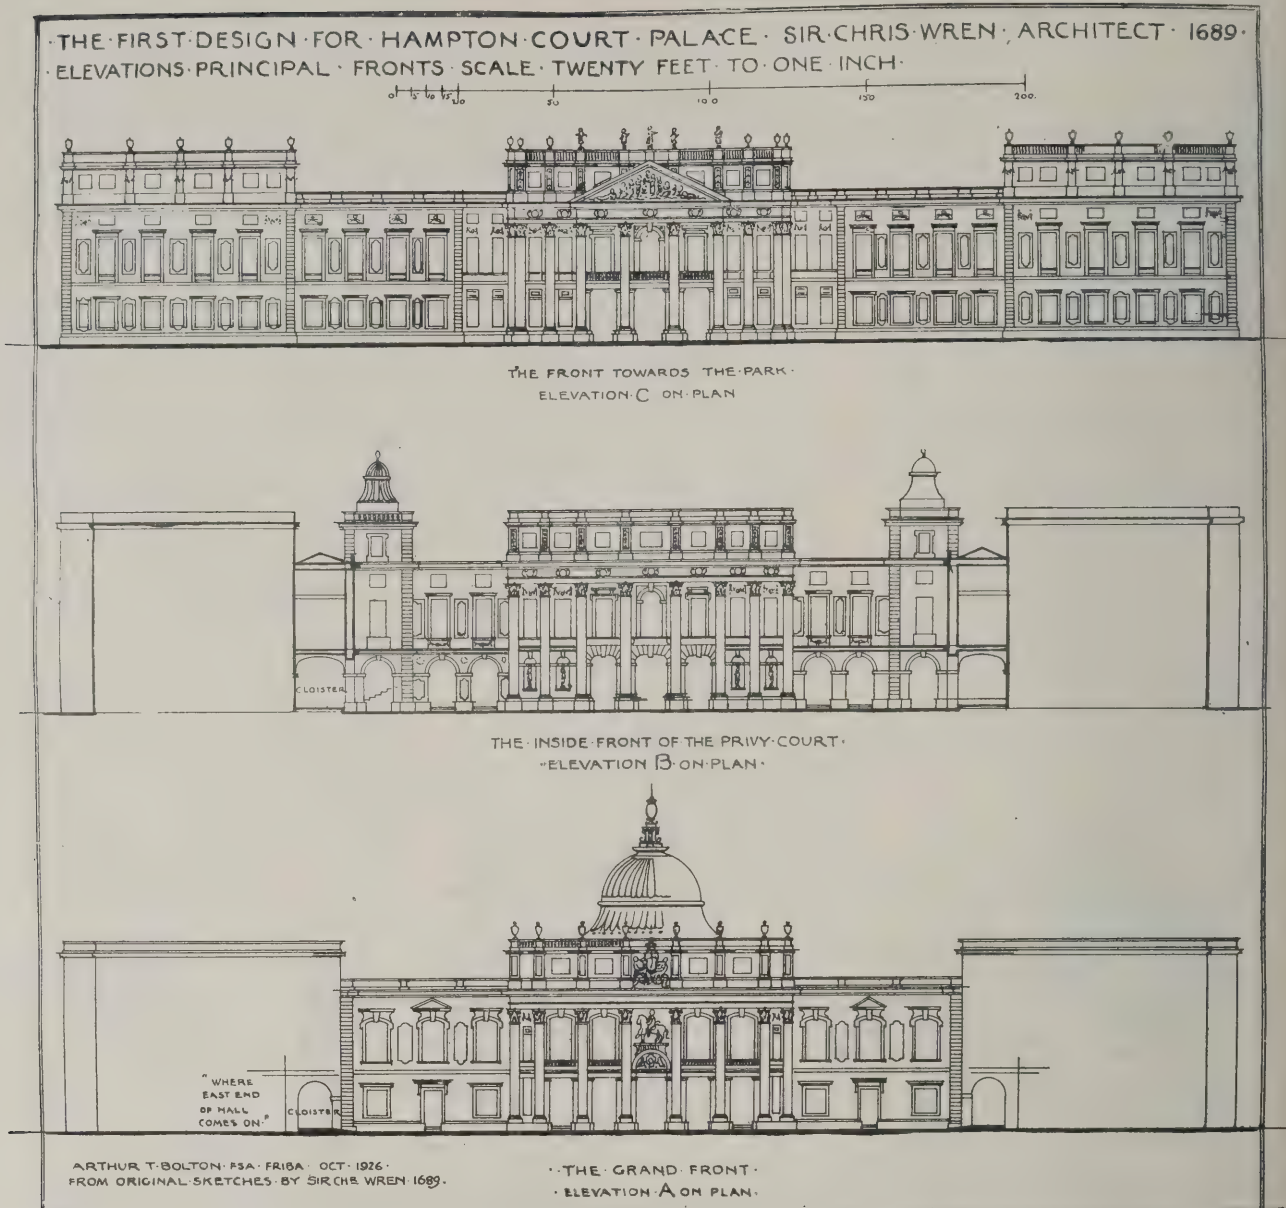

The "Meracol" Electric Fire, showing relative position of element and reflector.
(The Thermo Path Co., Ltd.)

Messrs. Benjamin Electric, Ltd., of Brantwood Works, Tariff Road, Tottenham, N.17. The design of these "Benjamin Biflectors" is based on the correct optical combination of two reflectors, an upper one and a lower one. The upper reflector is designed to obtain a wide distribution of the light source, and, in addition, to reflect a certain proportion of the light on to the outer surface of the lower reflector, which acts as a diffuser. At the same time, the lower reflector, which is cylindrical in shape, shades the light source from the line of vision, so that the fitting can be mounted at relatively short heights above the working plane and may be used for either general or local illumination. The "Biflector" illustrated can be supplied in 200 to 1,500 watt sizes, and is adapted for easy wiring in that the reflector portion is clamped to a cast flange, which carries the lampholder by means of two wing-nuts. Smaller fittings, constructed on similar lines, are made for use with lamps up to 100 watts; the canopies have the standard 1½-in. hole at the top for attachment to ordinary shade-carrier lampholders. The reflector por-

The "Benjamin Biflector" Fitting.
(Benjamin Electric, Ltd.)

tion of these fittings is made of heavy-gauge steel vitreous enamelled, green outside and white inside, but the canopies and screens can be supplied in either vitreous enamelled metal or in opal glass. One particular instance may be cited in which this type of unit has proved its efficiency, and that is in the textile industry. Here a wide distribution of light is required for the illumination of the bobbins or spools on the spinning frames, with a concentrated light on the spindles 30 to 36 in. from floor level. This has been obtained by installing Biflector fittings along the centre line of the alleyways, about 10 ft. apart and 6 ft. above the spindles. When placed slightly above the tops of the frames, the horizontal beam of light projected by the upper reflector will illuminate the spools for the purpose of noting the different tints of the yarn, but at a height of 2 to 3 ft. above the top of the frame this light will carry over the top of the adjoining frames to illuminate the threads directly under the roller which controls them.

WREN'S ORIGINAL DESIGN FOR HAMPTON COURT PALACE

By ARTHUR T. BOLTON, F.S.A., F.R.I.B.A.
Curator, Sir John Soane's Museum.

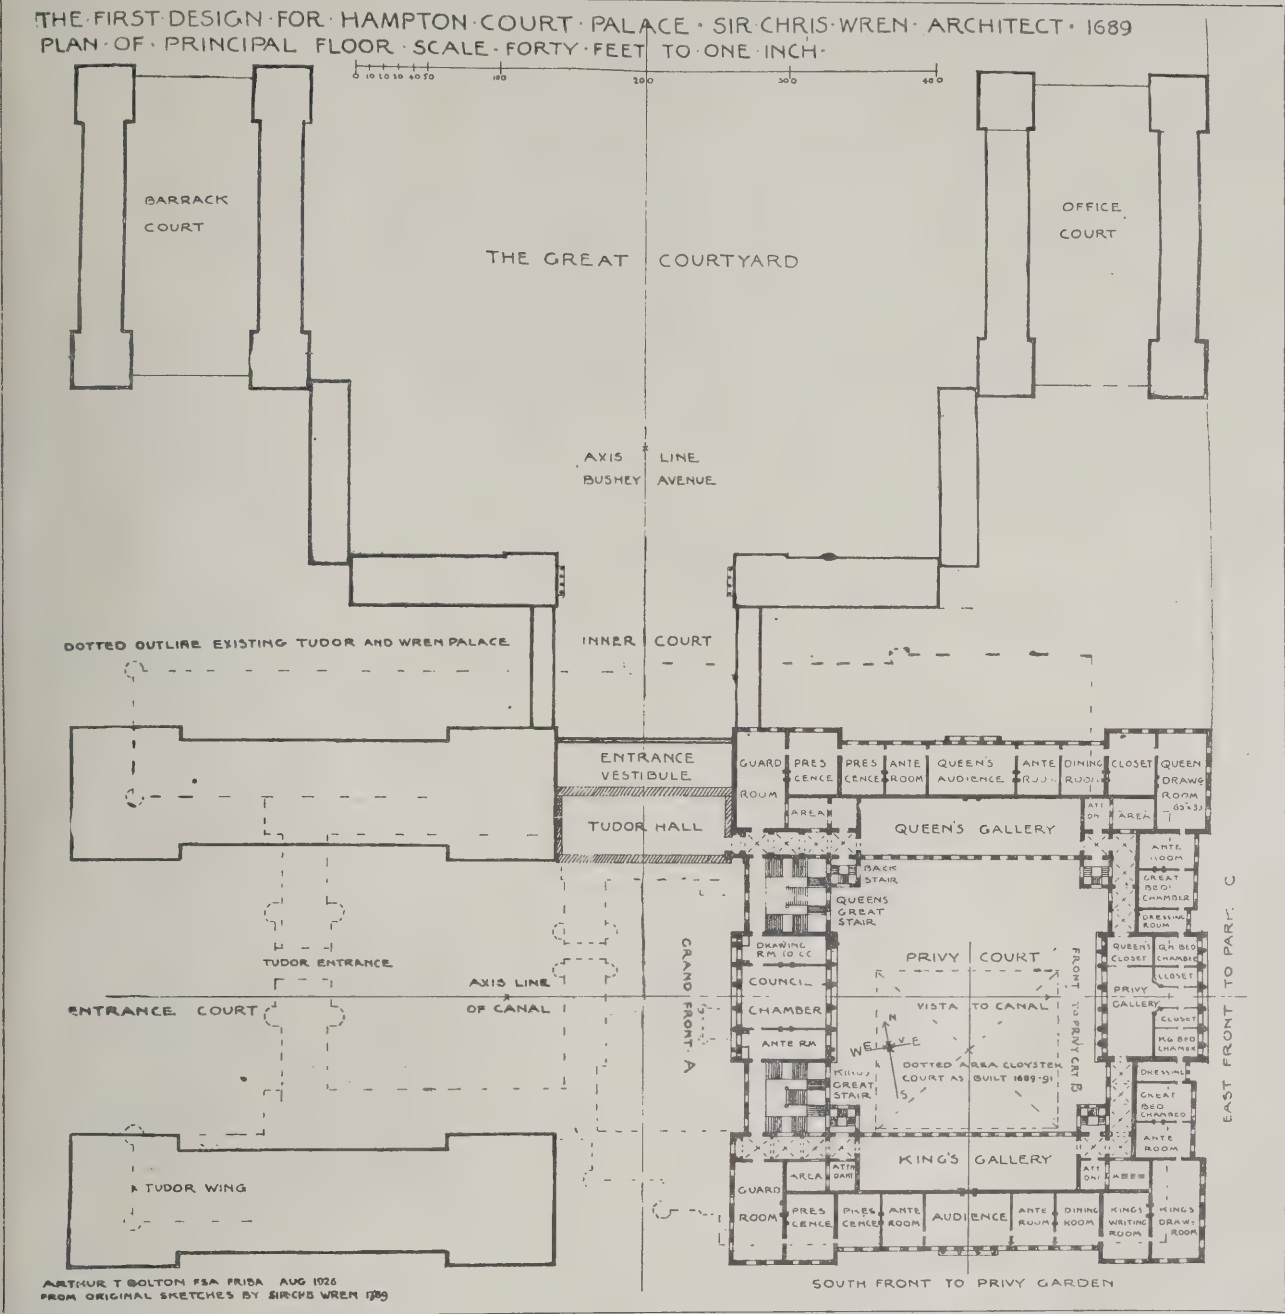

Apart from the rather slight reference to Hampton Court in a list of "Works for the Crown," given in *Parentalia* very little appears to be known on the subject of Sir Christopher Wren's real intentions and first design, of 1689, for the new Palace. The drawings illustrated here have been drawn out from three original pencil sketches, half elevations, on which are certain further indications in the form of notes. These, with the aid of an original small scale block plan drawn in ink, have proved, however sufficient to enable the general plan of the intended Palace to be recovered with a considerable degree of certainty. The existing palace gives, no doubt, in a reduced form some general idea of the nature of the accommodation for the King and Queen that had to be provided, and the missing details of the plan have been filled in accordingly.

These designs are contained in a book of drawings for Hampton Court, which has been traced back to the actual possession of Sir Christopher Wren, as it figures in the sale list of 1749, given in the 3rd volume of the Wren Society recently published. The

book came into the possession of George Dance, R.A., possibly from his father, and it was given by him to Sir John Soane in 1817, a noble gift from master to pupil.

The story begins with the landing of William on November 5, 1688, and the settlement by Parliament on January 22, 1689. Following on this, in April of that year, work began in the form of adapting the old Tudor Palace for lodgings for the King and Queen and the royal household. Mullioned windows were replaced by sashes, Tudor fireplaces built up, dado and other panellings and partitions, etc., inserted, William's Dutch friends having very definite ideas on modernism.

In laying out his plan, Wren had two dominant axial lines, those of the canal and of the intended Bushy Park Avenue. Their crossing gives a fixed position with which the old Hall, if preserved, must be reconciled. It has been necessary, therefore, on the data of his sketch elevations to allow for a possible discrepancy of about nine feet. Had the scheme proceeded, this point would easily have been adjusted

in the working out of the drawings. There is nothing to show whether the exterior of the Hall was to be refaced or to remain as the Tudor builders had left it. The scheme seems to imply a new vestibule, or entrance hall, on the further side. It seems probable that the hall floor would give the general level of the first floor of the new Palace, but there is no trace of any study of the levels, or other details of the scheme.

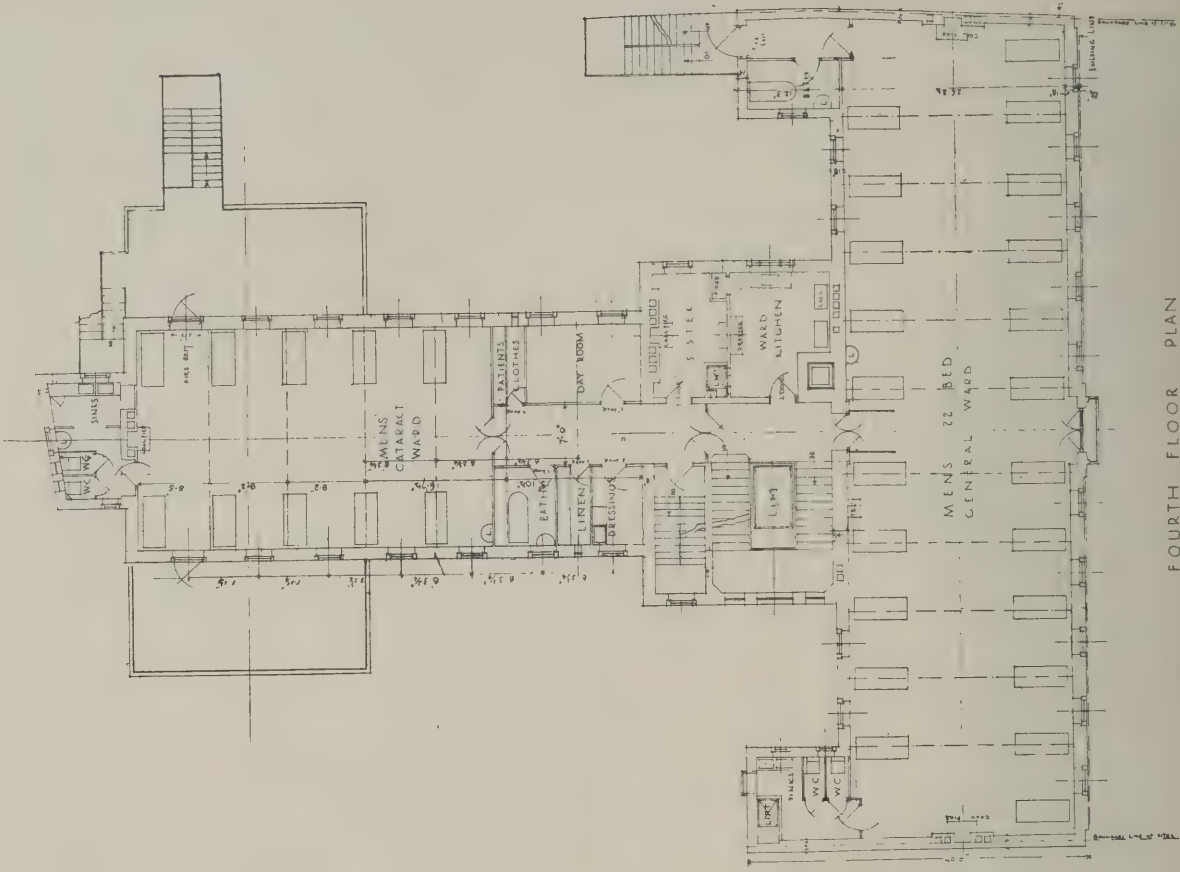

Wren's sketches for the new Palace must have been made in great haste, because it is clear that materials were being collected in June, and foundations dug in July. In fact the first measurement of executed masonry at the existing building is rendered in October. Work proceeded steadily until the crisis preceding the Battle of the Boyne, July, 1690, after which political decision, building was resumed with great vigour. The death of Queen Mary, in December, 1694, when less than five years had been spent on the work, was a great blow to the enterprise, and accounts for the considerable differences between the executed interiors and the designs which Wren and Grinling Gibbons had made for their decorations. Later, King William's interest so far revived that, between 1699 and 1702, he had some completion and

gardening works put in hand; and, had he lived, it is probable that the entire Tudor Palace would have disappeared as completely as is shown on the plan now illustrated, on which the Great Hall of Henry VIII alone remains

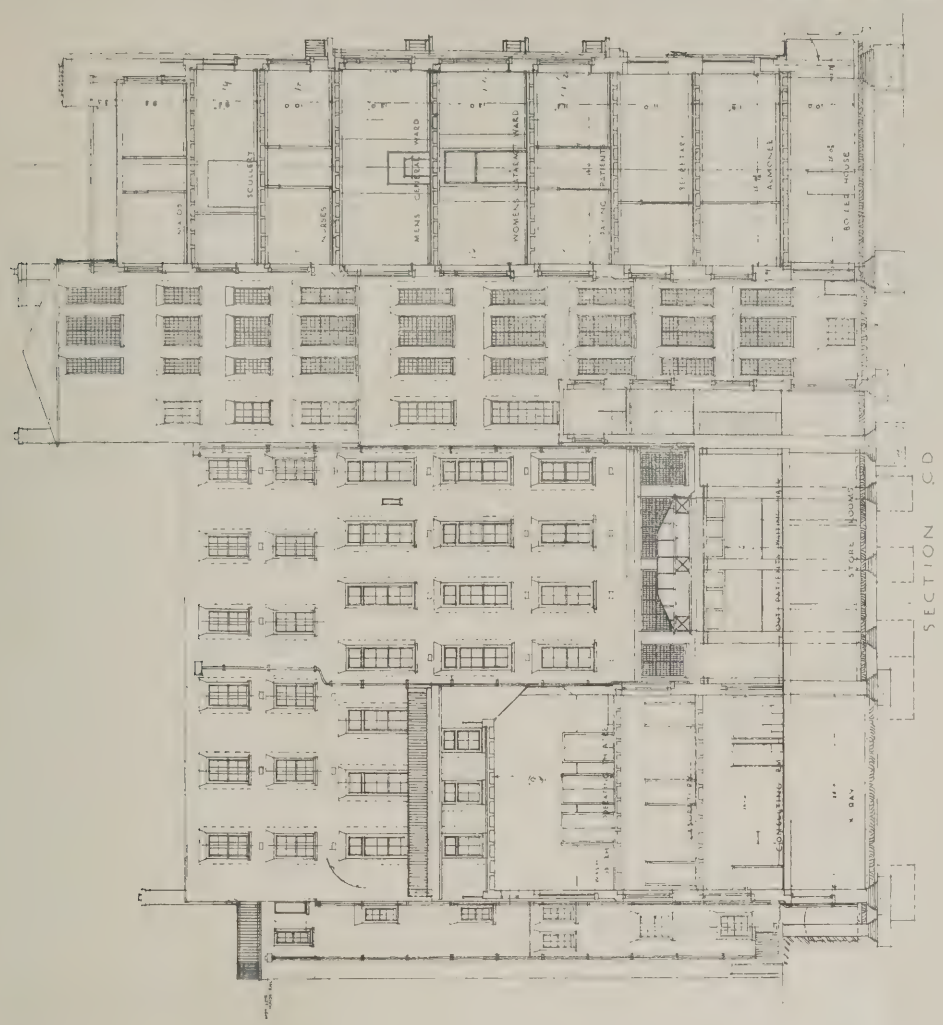

The death of William, March 8, 1702, following on a fall from his horse in the Park of Hampton Court, left the interior of Wren's Palace in a sadly unfinished condition. The inferior quality of the later work of Georgian times is apparent; and Queen Anne does not seem to have cared for a Palace so much associated with the sister with whom her relations had not been altogether harmonious. It is significant that, in July, 1700, the King sent urgent orders from his palace at Loo in Holland, that the "water gallery" on the Thames, particularly associated with Queen Mary, was to be immediately pulled down. It is impossible not to believe that this was in deference to her memory; but it is unfortunate that this elaborate piece of work was destroyed. It seems probable that the carvings, etc., were reused, and it is possible that there is a relation between the existing designs for Queen Mary's Closet within the Palace itself (not executed) and the work that was actually carried out at the "water gallery."

abilities, and supported him at a crisis in the work. He had, however, the urge to intervene which often afflicts men who build largely; although he nobly took upon himself the blame of having insisted on lowering the main floor of the Palace to an extent which crippled the cloisters below. The conclusion the writer has arrived at is that Wren's height for the main rooms was 25 feet, and that the King wanted 30, and that the actual figure, about 27 feet 6 inches, is a compromise between the two. It seems fairly clear that this disastrous alteration was made while the work was in actual building. The King's opinion, on the authority of Thomas, Earl of Pembroke, was "that these apartments (*i.e.*, the King's and Queen's Rooms at the Palace for good proportion, state and convenience jointly, were not paralysed by any Palace in Europe." The actual length of the façades given in the *Parentalia* are 328 and 330 feet.

The final remark is "If the world had not been deprived so soon of the inestimable life of Queen Mary, and had the Surveyor been empowered to have finished his whole design, Leland's description of Hampton Court would have been a truer resemblance

of its latter than primitive state.

*Est locus insolito rerum splendore superbus
Alluiturque vagâ Tamesini fluminis undâ
Nomine ab antiquo jam tempore dictus Avona,
Hic rex Wilhelmus tales his Condidit aedes
Magnificus, quales toto sol aureus orbe non vidit!"*

Certainly when "Sol Aureus" is pleased to favour the red, yellow and white façades of Hampton Court surrounded by its stately gardens, the student of architecture, recalling many another Royal Palace, ceases to be critical and endorses the settlement.

The Royal Westminster Ophthalmic Hospital

A start has now been made on the site of the new Royal Westminster Ophthalmic Hospital in Broad Street, W.C.2, a contract for demolition and excavation having been placed with Messrs. St. Mary's Wharfage, Ltd., South Wharf, Paddington Basin, W.2. The general contract has been awarded to Messrs. Prestige & Co., Ltd., Cambridge Wharf, Grosvenor Road, S.W.1, at £92,916. The architects are Messrs. Adams, Holden & Pearson, FFF.R.I.B.A., 9 Knightsbridge, S.W.

BRITANNIC HOUSE, FINSBURY CIRCUS, LONDON, E.C.
SIR EDWIN LUTYENS, R.A., Architect.

BRITISH ARCHITECTURE IN 1926

The decade we are now passing through, namely, the period from 1920 to 1930, is likely to be thought remarkable in architectural history for several reasons. There are two circumstances, quite unconnected with each other, which have been the cause of the enormous quantity of urban building now being undertaken. The first is that about a hundred years ago, after the final cessation of the Napoleonic wars and when it seemed as if a prolonged era of unbroken peace was about to begin, our towns developed with an extraordinary rapidity, and even to-day there still exists a very large amount of street architecture dating from that period. The second circumstance which is worthy of special mention is that most of the buildings then erected were held under a 99 years' lease. The immediate result of these two circumstances is that now, when very many of these leases are falling-in, the original buildings seem due for demolition. Thus the present age, while as far as architecture is concerned it may be described as an age of creation, is also to an almost unprecedented degree *an age of destruction*. We are now replacing rapidly, joyfully and perhaps a little thoughtlessly an enormous

number of buildings, many of which are not only of high artistic merit, but are still serviceable.

These buildings have, however, one inexcusable blemish in the eyes of their owners—they are not big enough, they do not enable a sufficient financial return to be obtained from sites of which the ground rents have vastly increased. What we are witnessing now is a great augmentation in the scale of our urban architecture. Not only are the buildings becoming taller, but the dimensions of their parts are becoming bigger. Especially is this so in the case of the great shops or "stores" which are springing up not only in the metropolis itself, but in the provincial towns.

In a period, like the present, when in so many of our streets there exist side by side examples of the new and the old, it is impossible to apply with strictness those civic standards according to which the buildings aligned upon a common thoroughfare should express a homogeneity, a comradeship as of an intimate society of members harmoniously united. We must not condemn the new because it does not conform to the old, but wait in patience until the buildings of to-day are flanked by others equally modern

OCEANIC HOUSE, MOORGATE STREET, LONDON.
SIR ASTON WEBB & SON, Architects.

and only when we are in the presence of a whole street of buildings of contemporary date can we estimate their true quality.

The year 1926 is of especial interest to us because its close marks the completion, or the virtual completion, of the principal portion of the new Regent Street, namely, that between Piccadilly Circus and Oxford Circus. We can now judge the effect of the new buildings when seen in juxtaposition and without being obliged to compare them with their Regency predecessors. As we and the generations who come after us have to live with these buildings for another hundred years, we shall be displaying a highly commendable and philosophic spirit if we find reasons for being pleased with them. The renovated Quadrant has been acclaimed in many quarters as a great success and, indeed, it may well be considered the most satisfactory part of the street. One obvious reason for this is that Sir Reginald Blomfield alone of the architects employed on the Regent Street façade was given a long expanse of frontage to deal with, and was thus enabled to secure a grand and imposing effect. Moreover, his task was made easier inasmuch as he was able to retain the noble sweep of the street curve originally determined by Nash owing to the decision of the Office of Woods and Forests that the lessees must accept a uniform design for their shop frontages. Without this, the Quadrant would have been ruined. In some respects Regent Street affords a good example of the inevitable conflict in styles and tendencies which are being manifested in modern architectural practice. Next to the Quadrant, which is designed in an individual variant of English Renaissance, is the redoubtable Vigo House, in which Sir John Burnet and Partners have given an example of a new type of architecture which issues a distinct challenge to some of the hitherto accepted conventions of street building. It may be a convenient procedure if, in this commentary upon the architecture of 1926, the various styles of building now exhibited be divided into two main groups—the “traditional” and the “modernist.” This is not to imply that the

traditionalists have made no concessions to modern needs or that the “modernists” have declined to benefit from the experience of the past, but rather that in the two schools of thought there is a difference of emphasis, the one being content to say new things in an old language, while the other would introduce modifications into the language itself.

Let us take traditionalism first. The name of Sir Reginald Blomfield has already been mentioned in this context. Besides the Quadrant, however, he has made another important contribution to the architecture of London in Messrs. Barker's new premises in High Street, Kensington. This building is of especial interest in that it shows that style is by no means the most important factor in architectural design, nor does it “date” a building nearly so distinctly as do certain other architectural qualities. The fact that in “Barker's” the detail is “Renaissance” with comparatively few innovations does not in the least prevent this building from expressing most emphatically the character of a great retail “store,” as such a building is at present conceived. The particular character here exhibited, it must be confessed, is partly an American character, that is to say, it was the Americans who first conceived of architecture as a means of exalting commerce to such an extent that commercial buildings assume a prominence greater than that accorded to other types of structure. “Barker's,” by virtue of the large scale of its parts and its conspicuous dome, seems a much more important edifice than the municipal buildings a few hundred yards farther down the street. In this it but expresses the tendency of the times and, according to one acceptance of the term, it is “modern.” It is, of course, possible to argue that a certain limited number of specially important commercial houses are fully entitled to assume a somewhat exalted architectural status, but the tendency when once begun is a little difficult to keep within reasonable limits. That the new shop belonging to Messrs. Wickams, in Mile

CARRÈRE & HASTINGS, in association with PROF. C. H. REILLY, Architects.

End Road, should be surmounted by a large cupola slightly reminiscent of that of the Port of London authority is very significant, because it suggests that we are perhaps entering an era in which the old-time distinction between public and private or commercial building will be entirely obliterated. A similar tendency is shown in Messrs. Atkinson's shop in Bond Street, designed by Mr. Vincent Harris. This building is given a *flèche* after the manner of the Guildhall.

That traditionalism in style is by no means a hindrance to the expression of the most modern needs is amply proved in the new Plaza Theatre in Lower Regent Street, in which Mr. Verity has employed Italian Renaissance motif to decorate an edifice which in its planning and technical equipment is the acme of twentieth century efficiency.

Another distinguished building which, while being admirably adapted to its purpose, yet claims kinship with the architecture of the past, is Messrs. Adshead and Ramsey's "Worthing Pavilion," which is in the Georgian tradition. In this instance the architects took the bold course of laying bare the steel constructional members in the interior of their building, but this concession to the spirit of industrialism was not made at the expense of the formal quality of the design, for the roof supports were arranged to a most agreeable pattern, which harmonised admirably with the Georgian detail. This is a remarkable case of the marriage of old and new elements in architecture. Most of the important commercial buildings, however, are only known to the public by their outsides, and it is to the façades that we must look for their salient characteristics. *Britannic House* by Sir Edwin Lutyens, *Oceanic House* by Sir Aston Webb & Son, and *Hambro's Bank* by Niven & Wigglesworth, *Devonshire House* by Carrère & Hastings in association with Professor Reilly, are all exercises in the traditional classic style, yet each has its special point of interest and divergence from the rest.

Britannic House, like everything else of Sir Edwin Lutyens, is an individual creation, a work which bears the impress of a single personality rather than of a movement. Here we have an architect trained in the tradition of the country house who has begun the study of civic architecture comparatively late in life and at a time when his style had already received an unalterable bias towards domesticity. This great commercial building is therefore given a distinctively domestic note, a comfortable homeliness which provides a very pleasant contrast to the extreme hardness and severity which characterises so many of the new office blocks being erected in London. *Oceanic House* is a notable example of straightforward design of a street façade in which well-known elements are combined to form a most satisfactory composition. *Hambro's Bank* is noteworthy in that it

DETAIL OF ENTRANCE, WORTHING PIER PAVILION.
ADSHEAD & RAMSEY, Architects.

WESLEY HOSTEL, CAMBRIDGE. SIR ASTON WEBB & SON, Architect.

exhibits a very important tendency, now noticeable in street façades, that of "isolation." In this case the façade has the requisite urban character—that is to say, its sky-line is restrained and takes its place naturally in the general street composition, it is devoid of protuberances such as would destroy its proper quality as the delineating feature of a thoroughfare and as a suitable background of its traffic and yet it takes great pains to dissociate itself from its neighbours by constituting a symmetrical pattern *within* its own boundaries. Here the elegant stone Corinthian pilasters set against a brick wall surface are grouped in a row and bound together by entablatures, and yet we find that this agreeable composition must not be allowed to be directly contiguous with the neighbouring façades but must be separated from them by bands of wallage on either side which at present have the agreeable effect of constituting a

transition between the main element of the façade and the buildings next to it. In this respect Hambro's Bank but expresses, though in a somewhat subdued manner, a general characteristic of urban buildings to-day, that is their aloofness and individuality which must be in all instances declared with precision. The old convention whereby a street façade opens its side, as it were, to its neighbours and invites them to enter into intimate aesthetic relationship with itself is, for the time at least, almost extinct. This is partly due to the piecemeal manner in which reconstruction is undertaken—a single façade here, and another a little distance away, it being well known all the time that it is useless to attempt in the new building to take much account of the old, which is destined to be demolished in the not very remote future; so the habit of visualising whole streets at the same time and of designing single façades of such a character that in isolation they look incomplete and require, for the fulfilment of their aesthetic intention, neighbours on either side of them obeying a formal convention similar to their own, cannot easily be acquired. Thus the architect of each new building is apt to take the line of least resistance and design a façade which looks complete and satisfying in itself and can make a considerable impression without requiring the aesthetic support of its neighbours. What will happen when all the old buildings are demolished and we have in their place rows of self-centred façades may easily be imagined. It almost appears that the problem of introducing a measure of cohesion in the new streets will be left to the generation succeeding our own. In Devonshire House we have a building which has special claims to have our respect inasmuch as it is an important attempt to solve a problem which has now been agitating the minds of architects for many years, namely, that of the proper exterior treatment of a ferro-concrete building. In this instance the architects have arrived at a solution which seems to them to be the only rational one. They have declined to be influenced by the doctrinaires who clamour for

UNITED METHODIST CHURCH, CARSHALTON.
ANDREW MATHER, Architect.

HARROW SCHOOL WAR MEMORIAL BUILDINGS.
SIR HERBERT BAKER, A.R.A. Architect.

BEAVER HOUSE, GREAT TRINITY LANE, LONDON.
WILLIAMS & COX, Architects.

the expression of the constructional members at all costs, whether or not the social qualities of the building are compromised by such a treatment, and on the other hand they have recognised that if the building is to be faced with the stone, the wallage should have a treatment noticeably different from that which indicates that the stone is used constructionally in the traditional manner. If stone happens to be nothing but veneer, then let it have the appearance of a veneer. Such is the argument, and there seems a good deal to be said for it. The stone is used just as a preservative to the framework, while it has the

additional quality of presenting a fine texture by which the structure is able to enter into an obvious relationship with other stone buildings in its vicinity. Another modern characteristic of this building is the treatment of the fenestration, which shows an American influence derived from the designers of skyscrapers, who have discovered that when the unit of fenestration is multiplied beyond a certain point, it simply creates confusion to elaborate the window openings by architraves or other ornament, and it becomes necessary to treat the windows as plain

MESSRS. ATKINSONS' PREMISES, NEW BOND STREET, LONDON. E. VINCENT HARRIS, Architect.

LONDON AND SOUTH AMERICAN BANK, LONDON.
MESSRS. JOSEPH, Architects.

The man who is initially responsible for successful and satisfactory architecture gains no pleasure therefrom if the work is badly executed. White concrete stucco renderings, such as the one illustrated above—composed of no ingredients except “Atlas White” Portland cement, a clean, sharp, white silica sand of coarse grain and clean water—depend for unequivocal success upon very simple rules of procedure. The physical laws that govern the action of Portland cement must be recognized, and must govern the procedure of the plasterer. *The full tensile strength and lasting properties of true Portland cement concrete will then be ensured.* My concise and easily understood “Atlas White” Stucco Specifications should be embodied in the working specifications for each bit of stucco work—no matter how small. Write for as many copies as may be required.

London, W. 1.

Frederic Coleman

rectangular apertures which are no longer "units" of composition as in the old-fashioned façade, but "sub-units" which should only be envisaged in groups, in large "chess-board" patterns. These groups are then treated as single elements in design and given the necessary articulation in the form of basement and crowning features, and frequently they are also provided with formal emphasis at their lateral extremities. Thus it is in Devonshire House. The basement or ground-floor storey, which is devoted to shops, is well separated from the remainder of the composition, while the main group of windows above has not only a decorative attic but has on each side of it projections which form, as it were, bastions emphasising its sides and providing it with a powerful enclosure. It has been said that this building shows the influence of the American zoning laws, but it need scarcely be supposed that a building erected in England has been designed to follow a fashion determined by a regulation which is not operative in this country. There is a quite sufficient aesthetic justification for the Devonshire House façade without it being necessary for us to explain it by reference to

PREMISES FOR WICKHAMS, LTD., MILE END ROAD, LONDON. P. JAY EVANS & SON, Architects.

EXTERIOR, NEW PREMISES, FOR JOHN BARKER, LTD., KENSINGTON, LONDON. SIR REGINALD BLOMFIELD, R.A., Architect.

such an hypothesis. It is perhaps worth while to mention that in certain buildings erected in England there is observable a tendency to adopt these plain rectangular openings in cases where the façades are comparatively small and where the windows are not so numerous that they could not quite appropriately be given the status of individual features in the composition. This fashion has sometimes been described as properly expressive of the "post-war" spirit, in which "economy" and "severity" are supposed to be heavily represented, but in point of fact it is more probable that a fashion which seems to many people as a somewhat unpleasant affectation of Puritanism, is really due to nothing more than a misunderstanding of an American convention, quite justifiable in the place of its original adoption, that is to say, in the vast façades of "skyscrapers." A little of this "Puritanism" is perhaps expressed in the design of the London & South American Bank, by Messrs. Josephs, in which the façade, while pleasing in its broad effect of simplicity, has nevertheless a certain absence of elaboration which may, however, be justified if we regard it as a valuable protest against some of the too lavishly ornamented bank buildings which have been erected in recent years.

While deprecating an effect of baldness in fenestration, we may well acknowledge the excesses in the opposite direction. Two interesting examples of the modification of existing façades suffering from fussiness and over-ornament are to be found in Messrs. Stagg & Mantle's building in Leicester Square, of which the façade has been renovated by Mr. Austen Hall, and the Ambassador Club in Conduit Street, modified by Messrs. Durand & Allison. In both these cases Victorian elevations have been greatly improved, and the success of the process suggests that many of our most atrocious buildings, which are not yet due for demolition, may very well be subjected to a like treatment. In the execution of such a policy

No. 4

REPUTATION is the standard by which an article is judged; it grows as the article becomes more familiar.

The specification by Architects of Courtrai-Du Nord Roofing Tiles has steadily grown. Now, the reputation which these tiles have earned for themselves is enough in itself, to merit an Architect's Specification.

May we send you particulars of the Service which we offer?

of improvement and renovation of existing façades architects could be kept very busy for many years to come!

Of the "modernist" buildings and semi-"modernist" buildings erected in 1926, not many conspicuous examples are in evidence. It is perhaps a little difficult to describe what the essence of "modernism" is, but one is probably correct in saying that whenever the "Orders" are used in an unconventional manner, or whenever a façade is characterised by "vertical emphasis," a certain measure of this "modernism" has crept into the façade. The remarkable design by Mr Sullivan for Messrs. Courtauld's building in St. Martin's-le-Grand shows pilasters elongated to unusual dimensions and having in proportion a very small intercolumnation. It is

FACTORY, CLERKENWELL, LONDON. PERCY TUBBS, SON & DUNCAN, Architects.

noteworthy that the windows between the pilasters extend to the very edges of the latter without any intervening wall surface, and this is itself a conspicuous novelty in design. It has the effect of depriving the windows of articulation at their sides and the pilasters in sweeping past them without recognition relegate them to a very subordinate place in the composition. By using the Order, however, even in this distorted form the "vertical emphasis" is of a very different kind from that obtained when the windows are arranged in vertical columns or slits, because here the capitals to the pilasters draw our attention to the fact that we are in the presence of a colonnade, each member of which is an important unit of wallage, and the intervals between the pilasters are obviously subordinate to the pilasters themselves.

SHOP FRONT, BERKELEY STREET, LONDON. Designed by FITZGEORGE.

But in the other kind of verticality as displayed in Adelaide House, in Austin Reed's new premises in Red Lion Square, and to a certain extent in Vigo House, the vertical divisions of wallage are not articulated by terminal features, and they are made subordinate to the long apertures or slits in which several windows are grouped one under the other. When the pilasters are used in close formation, the windows are rendered inconspicuous and formally scarcely existent, but when the apertures are made the units of composition, they are apt to be distorted to an inhuman dimension. It is sometimes claimed on behalf of "vertical emphasis" that it expresses ferro-concrete construction, but it is difficult to see how such a view can be seriously held, as in this method of building the horizontal members are just as important as the vertical and, one would imagine, just as worthy of expression on the outside of the building. But be that as it may, there can be no doubt that these new façades are highly interesting experiments, and show that a serious attempt is being made to discover new architectural forms.

BEDFORD SCHOOL MEMORIAL BUILDING.
OSWALD P. MILNE, Architect.

Other buildings expressing a spirit of innovation are the Holloway Arcade, by Mr. Gieves; the new stations for the Morden Tube extension, by Messrs. Adams, Holden & Pearson; Milbroy Wharf, by Mr. A. Howell Ridge, the Second Church of Christ Scientist, by Sir John Burnet & Partners; a new factory in St. John Street, Clerkenwell, by Messrs. Percy Tubbs, Son & Duncan; and a factory in Welwyn Garden City, by Mr. Louis de Soissons. All these buildings are distinguished by a logical solution of the architectural "programmes" presented, and are of especial interest in that they are attempts to create an architecture which relies but little upon ornament. The designs for factories show a welcome tendency on the part of owners of industrial concerns to give to their buildings a seemly appearance.

If the principal part of this article has been devoted to urban architecture, it is because nine-tenths of our population now live in towns. This is not to say, however, that the architecture of the detached building is being neglected. The Harrow School Memorial Buildings, by Sir Herbert Baker, the Charterhouse School Memorial, by Sir Giles Gilbert Scott,

NEW GALLERIES, NATIONAL GALLERY OF BRITISH ART,
LONDON. ROMAINE-WALKER & JENKINS, Architects.

the Bedford School Memorial, by Mr. Oswald Milne, and the Wesley Hostel at Cambridge, by Sir Aston Webb & Son, not to mention a large number of important country houses, show that modern architecture still derives considerable inspiration from the achievement of our mediæval ancestors, and if necessary can show buildings worthy to be set beside the works of the Gothic and transitional periods.

A review of the architecture of 1926 would be very incomplete which did not include a reference to a circumstance of great import, namely, the increased interest in architecture as shown in the public determination to preserve if possible such beautiful buildings as we still possess. The report of the Royal Commission on London Traffic Facilities in favour of the retention of Waterloo Bridge, the decision of Parliament to resist the wanton destruction of the City Churches, and the attempt which is now being made to save Bloomsbury, all prove that architecture is now recovering from the neglect it has so long suffered.

The Royal Society of Arts

Annual Competition for Architectural Decorative and Industrial Designs

The Royal Society of Arts has issued its Syllabus of its Fourth Annual Competition of Industrial Designs, open (a) to all British subjects (with certain specified age limitation in some sub-sections), and (b) to British students in British schools of art and kindred institutions. These competitions are for (1) Architectural Decoration, (2) Textiles, (3) Furniture, (4) Book production, (5) Pottery and Glass, and (6) Miscellaneous.

In Section (1) Architectural Decoration, a prize of £50 is offered in Sub-section (1) Decorative Architecture for designs for the entrance hall to a block of high-class flats, all above the ground floor, which is let as shops and has no connection with the flats. A chimney-piece and two passenger lifts, staircase and accommodation for porter and telephone are to be included. In Sub-section (2) a prize of £20 is offered for the best topographical drawing of a building or group of buildings, or series of not more than six topographical drawings in any medium. In Sub-section (3) Messrs. Baguès, Ltd., offer a prize of £50 for the best design of wrought-iron gates for a carriage entrance, with two side gates for pedestrians, suitable for an important City company building. The building is presumed to be of the date 170-1715. In this Sub-section Mr. A. W. Martyn offers a second prize of £25 for a design for wrought-iron gates in accordance with the same specification. Sub-section (4) is for designs for a pedestal of an equestrian statue of the late Lord Kitchener, to be erected in an open place in a large provincial town. A first prize of £15 and a second of £5 are offered by the Chairman of the Architectural Decoration Committee. In Sub-section (5) Messrs. Ackroyd & Best, Ltd., offer a prize of ten guineas for a design of an electrical fitting suitable for a central position in an average-sized room. In Sub-section (6) Messrs. Shuffrey & Co. offer a prize of five guineas for the design of a marble fireplace for the vestibule of an Aeronautical Club. Sub-section (7) comprises competition for the Lewis-Berger Annual Scholarship, value £60, to cover cost of fees, maintenance, materials and travelling expenses, tenable at the Royal College of Art, London, and for a period of three months, for the study of decorative and decorative painting. Competitors, over 18 and under 25, must be bonâ-fide apprentices.

Full particulars of the competitions in all sections can be obtained from the Secretary of the Royal Society of Arts, John Street, Adelphi, London, W.C.2.

London Building Notes

CHEYNE WALK.—The sites of Nos. 64-69 Cheyne Walk, Chelsea, S.W., are to be developed for building purposes. Plans have been prepared by Messrs. Elms & Jupp, F.F.R.I.B.A., 25 Sackville Street, W.1, architects to the estate, for the erection of 12 large and modern fitted town residences.

FULHAM.—Plans have been prepared for the reinstatement of the premises at the Belmont Institution of the Fulham B.G. The architects are Messrs. A. Saxon Snell & Phillips, 9 Bentinck Street, Manchester Square, W.1.

HAMMERSMITH.—In connection with the purchase by the London Co-operative Society, Ltd., of the large shops and businesses of Messrs. J. Hunt, Ltd., at King Street, Hammersmith, W., it is understood that important structural and equipment improvements to the premises are contemplated. The Society's architect is Mr. L. G. Ekins, F.R.I.B.A., 90 Leman Street, E.1.

HORNSEY.—Revised plans have been completed and forwarded to the Hornsey E.C. in connection with the building of the proposed new elementary school on the Coldfall Housing Estate. The architect, Mr. H. Carter Pegg, F.R.I.B.A., 35 Parliament Street, Westminster, S.W.1, shows a building providing places for 810 scholars.

ILFORD.—The Ilford United Methodist Circuit is to proceed with the erection of their new church building which is estimated to cost £12,000. Plans have been prepared by Messrs. George Baines & Son, F.F.R.I.B.A., 121 Victoria Street, Westminster, S.W.1, for a brick building with stone dressings.

MARYLEBONE.—In connection with a general improvement scheme it is proposed to carry out structural, and other alterations at the nurses' dining hall at the St. Marylebone Hospital, Rathbone Street, W. Plans have been prepared by Messrs. Constantine & Vernon, F. & A.R.I.B.A., 82 Mortimer Street, W.1.

MORTIMER STREET.—Included in the plans of the Middlessex Hospital for the rebuilding of their main premises is the erection of a new nurses' home on a site—Foley Street, S.W.1. The plans, prepared by Mr. A. W. Hall, F.R.I.B.A. (Messrs. Young & Hall, 17 Southampton Street, W.C.) show a building of 7 stories.

PICCADILLY.—Work is in hand on the conversion of Wolseley House, at the corner of Piccadilly and Arlington Street, W.1, into branch premises for Messrs. Barclay's Bank Ltd. Plans have been prepared by Mr. W. Curtis Green, A.R.A., 5 Pickering Place, S.W.1.

POLAND STREET.—In connection with the proposal to build new business premises at the corner of Poland Street and Noel Street, W.1, plans have been prepared by the architect, Mr. J. J. S. Naylor, F.R.I.B.A., 19 Hanover Square, W.1, showing shops on the ground floor and offices above. Excavations on the site are being carried out by Messrs. Hall, Beddall & Co., Ltd., Waterloo Bridge, S.E.1.

REGENT STREET.—It is proposed to let on lease for building purposes the site of No. 88 Regent Street, W.1, owned by H.M. Office of Woods and Forests. The surveyor is Mr. John Murray, F.S.I., 11 Suffolk Street, Pall Mall, S.W.1.

RICHMOND.—A large property in the Quadrant at Richmond has been purchased by the Saxone Shoe Co., Ltd., 60 Strand, W.C.2, who propose to open a new branch shop. Extensive structural alterations and the installation of new shop and display fronts are proposed.

ST. GEORGE'S IN THE EAST.—A building site in Backchurch Lane, E., comprising Nos. 66 and 68 and parts of Nos. 70 and 72, have been acquired by Messrs. Mann, Crossman & Paulin, Ltd., brewers, Whitechapel Road, E.1. Plans are being prepared by the company's architect, for a new public house to be designed on modern principles.

SLOANE SQUARE.—The London Electric Railway Co. have decided to rebuild Sloane Square Station on the District Railway, and to provide a new booking hall and entrance and escalators to the platform. The architecture of the building will closely follow that of the stations on the new Morden line, designed by Messrs. Adams, Holden & Pearson, F.F.R.I.B.A., 9 Knightsbridge, S.W. The architect to the "Underground" group is Mr. S. A. Heaps.

SOUTHWARK.—A site in St. James Road, S.E., is to be developed by the owners, Messrs. J. A. Francy & Son, builders, 134 Southwark Park Road, S.E.16. It is proposed to build a block of two storey buildings, including billiards hall, shops and garages. Plans have been prepared by Messrs. Leighton & Higgs, architects, 9 St. Thomas's Street, S.E.1.

STRAND.—Arrangements for the conversion of the large building at the corner of Strand and King William Street, W.C.2, sold recently by the British Medical Association to the New Zealand Government, into new offices, will be made as soon as possession is obtained. Plans for the reconstruction work have been prepared by Messrs. Hal Williams & Co., architects, 79 High Holborn, W.C.2.

STRATFORD.—A contract has now been placed for the erection of large additions to the buildings at Stratford, E.15, of the Queen Mary's Hospital for the East-end. The plans show the enlargement of existing wards, new office buildings, and alterations to sundry premises, and are the work of Messrs. Newman & Jacques, 61, West Ham Lane, E.15. The builders are Messrs. H. C. Hanswill, Ltd., 182 Green Street, E.7, whose tender amounted to £30,180.

SURBITON.—A sum of £5,000 is to be expended by the committee of the Residential College for Working Women, at Hillcroft College, Surbiton, S.W., upon the conversion of an adjacent stables block into additional dormitories. The architect to the college is Major Douglas Wood, F.R.I.B.A., 35 Craven Street, Strand, W.C.2.

SURBITON.—Plans for the proposed conversion of a block of stables adjacent to the Residential College for Working Women at Hillcroft College, Surbiton, into residential accommodation for students, have been prepared by Major Douglas Wood, F.R.I.B.A., 35 Craven Street, Strand, W.C.2. The cost is estimated at £5,000.

TWICKENHAM.—It is proposed to develop a large area of land facing Hampton, Wellesley, Spencer and Walpole Roads, which forms part of the estate of the Carpenters' Company. The plans include the erection of 320 houses. The architect to the Carpenters' Company is Sir Banister Fletcher, F.R.I.B.A., 1 Kings Bench Walk, E.C.4.

VICTORIA.—Negotiations are proceeding with regards to the proposed rebuilding of the "Windsor Castle" public house, at the corner of Wilton Road and Vauxhall Bridge Road, S.W.1, owned by Messrs. Watney, Combe, Reid & Co., Ltd., brewers. Plans have been prepared by the architect to the Stag Brewery, Westminster, S.W.1.

WESTMINSTER.—A large site in Willow Street and Greencoat Street, S.W.1, has been leased by the Ecclesiastical Commission to new owners who propose to erect a block of self-contained flats, provision being made for 42 flats in all. The plans have been prepared by Messrs. H. V. Ashley & Winton Newman, F.F.R.I.B.A., 14 Gray's Inn Square, W.C.

WOOLWICH.—An appeal is being made by the governors of the British Hospital for Mothers and Babies, in Samuel Street, S.E.18, for funds to enable the completion of the hospital buildings to be carried out. It is proposed to expend about £100,000 upon the building for a new wing. Plans have been prepared by Messrs. Young & Hall, 17 Southampton Street, W.C.2.

WOOLWICH.—Good progress is being made upon the first section of the proposed Woolwich War Memorial Hospital which is expected, when completed, to cost about £250,000. The first buildings will accommodate about 100 beds and have been designed by Messrs. William A. Pite, Son & Fairweather, Carterer Street, Westminster, S.W.1. The builders are Messrs. Foster & Dicksee, Ltd., Manresa Road, S.W.

WESTMINSTER.—The Rev. A. E. Cornibee, Vicar of St. Matthew's Church, Westminster, S.W.1, intends to erect a block of new schools on a site in Old Pye Street, S.W.1. Plans for the new buildings have been prepared by Mr. J. H. Gibbons, architect, Abbey House, Victoria Street, S.W.1.

WESTMINSTER.—New premises are being provided in Ranelagh Road, S.W., for the London Light Clinic. The builders are Messrs. Higgs & Hill, Ltd., Crown Works, South Lambeth Road, S.W., whilst Messrs. Young & Co., 6 Queen Anne's Gate, S.W.1, will supply and fix the steelwork. The architects are Messrs. Bailey & Dudley, 92 Victoria Street, S.W.1.

HY-RIB

The combined reinforcement and centering

THE NO. 4 RETORT HOUSE FOR THE GAS WORKS, WADDON, CROYDON.

Chief Engineer: A. CADDICK. Main Contractors: DRAKES, LTD. Sub-Contractors: HENRY HEMMINGS, LTD.
All the wall panels (3,000 square yards) are constructed of Hy-Rib.

— HY-RIB —

UTILITY

Hy-Rib eliminates costly-close boarded shuttering and false work.

Hy-Rib is used for concrete floors, walls, roofs, partitions and ceilings; curved Hy-Rib for arched floors, culverts, silos, tanks, reservoirs and tunnels.

Hy-Rib is used in conjunction with any kind of framework—reinforced concrete, structural steel, or timber.

Hy-Rib is used for every type of construction, large or small.

SERVICE

Hy-Rib is supplied cut to length, ready for fixing.

Hy-Rib can be delivered, when required, curved ready for fixing, thus saving expensive labour on the site.

Working drawings are carefully prepared to assist the contractor in fixing the Hy-Rib easily, speedily and economically.

Hy-Rib is bundled and marked before leaving our works to coincide with the working drawings.

Hy-Rib inquiries and orders are expeditiously dealt with.

THE TRUSSED CONCRETE STEEL CO. LTD.

The Week's Building News

The following abbreviations are used: U.D.C. for Urban District Council; T.C. for Town Council; R.D.C. for Rural District Council; E.C. for Education Committee; B.G. for Board of Guardians; P.C. for Parish Council; B.C. for Borough Council; M.H. for Ministry of Health; M.T. for Ministry of Transport; C.B. for County Borough; B.E. for Board of Education.

ABERDEEN.—The Governors of Robert Gordon's College have decided to proceed with the erection in three sections of buildings to provide accommodation for the technical departments of the college, at an estimated cost of £37,200. Mr. R. Leslie Rollo, principal teacher of architecture at the college, has been appointed architect for the work.

ALDRIDGE.—A scheme for the erection of a new War Memorial Hall has been approved. The building is to be of a single-storey type, and a site has been obtained in Rookery Lane. The total cost of the building is £3,000.

ASHBOURNE.—The U.D.C. are to apply to the M.H. for sanction to grant financial assistance in respect of 6 more houses.

ASHFORD.—The R.D.C. propose purchasing housing sites at Ashford Common, Feltham Hill (Ashford), Bedford Close, Cranford, and Hanworth, for the erection of 164 houses.

ATHERSTONE.—Official sanction was given to the R.D.C. to the raising of a loan of £2,600 for the purchase of land required for the erection of about 80 houses.

AUDENSHAW.—Mr. J. H. Revell is to erect 12 houses in Hadfield Street, Audenshaw.

BALCOMBE.—The Cuckfield R.D.C. propose erecting working-men's houses on a site in Dean Land Road, Balcombe.

BARNT GREEN.—Mr. S. N. Cooke, F.R.I.B.A., of Birmingham, was the architect of the new school which has just been erected at an approximate cost of £6,000. The contractors were Messrs. Brazier, of Bromsgrove.

BILSTON.—Mr. Hurley Robinson has prepared plans for a cinema in High Street, Bilston, on behalf of Wood's Picture Halls, Ltd.

BIRMINGHAM.—The work of clearing the site and preparing the foundations of the new buildings for the Commercial Union Assurance Co. is now in operation. Mr. Whittall, of Birmingham, is the contractor.

BIRMINGHAM.—The Corporation are to erect new bank premises at Hall Green, at a cost of £3,400, and at Pershore Lane, at a cost of £6,500. Bingley Hall and other property is being acquired in connection with the Civic Centre Scheme. A report shows that the capital expenditure proposed by the various departments totals £21,000,000. The E.C. have approved estimates of £234,000 for sites for school buildings. Two sites are being obtained for the provision of open-air schools.

BIRMINGHAM.—A large office building, of six floors, is to be erected in Bennett's Hill, for the Commercial Union Assurance Co., Ltd. Excavation work is now being carried out by the contractors, Messrs. Whittall & Sons, Lancaster Street, Birmingham. The steelwork will be erected by Messrs. E. C. & J. Keay, Ltd.,

Birmingham. The plans have been prepared by Messrs. Riley & Smith, 115 Colmore Row, Birmingham.

BIRMINGHAM.—The new dance hall, adjoining the West End Cinema, has just been completed.

BRADFORD.—The Corporation proposes to build 340 houses on the Wyke Housing site by direct labour. The cost of the scheme, including roads and sewers, is estimated at £175,000, and application is to be made for the necessary borrowing powers.

BRADFORD.—The Estimates Sub-committee of the City Council have recommended for acceptance the scheme for the erection of 350 houses on the Shirley Manor Estate at Wyke, at a cost of £177,000.

BRISTOL.—The City Council has given approval to contracts for 68 non-parlour-type houses to be built at Shirehampton and Bedminster Down, at a cost of £30,236. The foundation-stone of a new War Memorial Hall was laid recently at Filton, nr. Bristol. The hall, which will have a seating accommodation for 300, will cost about £2,500. Plans are being prepared for the erection of 25 houses at Soundwell. The houses will be erected by private enterprise.

BURSLEM.—A contract has now been entered into for a group of houses. The architects are Messrs. Ford & Slater, of Burslem.

CHEADLE.—The Staffs E.C. are considering proposals for the erection of a new school, also the conversion of the existing Council School and the conversion of the C.E. school into a senior school.

CHADSMOOR.—The Chadsmoor Progressive Club Committee have provided new premises in Burn Street, at a cost of about £2,500. Mr. Samuel Harrison was the architect, and Messrs. F. & V. Linford the builders.

CANNOCK.—The Staffs E.C. propose to purchase two acres of land from the R.D.C. at Featherstone as the site for a new school.

CHILMSFORD.—The T.C. are to erect a caretaker's bungalow in Admiral's Park.

CHELTENHAM.—The Cheltenham Council of Social Welfare have prepared plans for concrete block houses to be erected at the Home Crofting Scheme. Plans have been prepared for the erection of 60 three-bedroomed houses and 20 of two bedrooms on the Hank's site. The Ladies' College Council are to erect a gymnasium in Montpelier Street.

CHERTSEY.—The M.H. has given sanction for the erection of 24 houses on the Green Lane site.

CITY OF LONDON.—The Corporation are to widen Foster Lane, at a cost of £15,000, by setting back the premises of St. Martin's House.

CHORLEY.—The E.C. have approved plans prepared by Messrs. Biram & Fletcher for the provision of an open-air school and the adoption of the

Grammar School, at a cost of £8,000. The managers of the Parochial School are to modernise the buildings. The Corporation have acquired seven acres at Rangletts for the erection of further houses.

CLACTON.—At the last meeting of the Essex E.C. it was reported that plans for the new secondary school at Clacton had been approved.

DALBEATTIE.—The T.C. have decided to erect three blocks of houses on sites at Bellevue.

DOVER.—Mr. H. E. Vernon Shone has prepared plans for converting the Royal Hotel, Clarence Place, into flats. Twenty-four houses are to be built in Green Lane to re-house tenants displaced by an improvement scheme. The Corporation are inquiring if the Admiralty propose to demolish the Promenade Pier, and, if so, to carry out the work without delay. It has been decided to erect 34 houses on the Noak's Ark Farm Estate. Mr. J. F. Matthews is to erect 12 garages in Leighton Road.

DRAYTON.—The R.D.C. propose to have a further housing scheme, and 36 additional houses are to be erected, subject to the approval of the M.H.

DUNDEE.—The T.C. has decided to recommend to the Council a scheme for the extension of the western esplanade at an estimated cost of £70,000.

EASTBOURNE.—The Borough Engineer has prepared plans for an extension of the Holywell bathing station. Proposed improvements at the Redoubt and Grand Parade are to be discussed with the Chamber of Commerce. The Comptor Estate has prepared a lay-out of land to be developed south of Seaside. Forty-eight concrete houses are to be built at the Crumbles. Plans passed: 10 houses, North Avenue and the Crescent, for Mr. P. D. Stoneham, architect.

EAST ASHFORD.—The U.D.C. propose applying for sanction for a further housing scheme. The Ashford and Naccault Brick and Tile Company are to erect another 12 subsidy houses.

EARLESTOWN.—The Council has accepted the offer of the M.H. to erect 50 houses. It was decided that the houses be of the non-parlour type, and that the architect be instructed to prepare plans and specifications.

EGHAM.—Plans passed by the D.C.: H. Atkins, 14 bungalows, Rusham Road, Egham; 7 shops and houses, Station Road, Egham.

ESHER.—It is proposed to erect a hall and club rooms near the Council offices.

EVESHAM.—The R.D.C. propose to erect 90 houses before October next. The sanction of the M.H. has been granted to the erection of houses at Norton.

EXETER.—The City Council have given the Housing Committee authority to accept a tender for the erection of a further 108 concrete houses on the Buddle Lane Estate, St. Thomas.

Timber Guaranteed by the makers of Solignum

Special interest attaches to the Newton Abbot Housing Scheme, 1926 (Contractors: The Universal Housing Co., Rickmansworth). A guarantee has been given by Major & Company Ltd. against Dry Rot occurring in any of the woodwork properly treated with Solignum.

This is of particular importance to builders and tenants. The use of Solignum for the structural timbers ensures freedom from constant repair bills. Linoleum can be laid immediately on floor boards treated with Exterior Brown Solignum without risk of Dry Rot.

Regd. Trade Mark.

WOOD PRESERVATIVE AND STAIN

We offer co-operation in Dry Rot Cases. Write to Major & Coy., Ltd., 205 Borough High Street, London, S.E.1

FALKIRK.—The Dean of Guild Court has granted warrants at 20 and 18 Cow-Wynd, for the erection of a two-storey building, with 6 shops on the ground floor and a public hall above, at an estimated cost of £3,500.

FULHAM.—The Borough Surveyor has prepared plans for the erection of a new convenience on Eelbrook Common at an estimated cost of £2,835.

GLASGOW.—Plans are to be prepared for a new observation ward, etc., at Belvedere Hospital. The City Engineer has prepared plans for a garage at Govan, the cost being estimated at £25,000. A special committee are to consider proposals for the provision of a fire station in the north-western area, having had a report on the pier and panel system of house construction. Plans passed: 8 houses, Kelburn Avenue, for Messrs. Taylor & Wilson; 4 houses, Dean Road, for Mr. Allan Gilfillan.

GLASGOW.—A site has been secured with frontages to Jane Street, Pitt Street, and West Regent Street, for the erection of the Scottish National Commercial College, which is estimated to cost £100,000.

GUILDFORD.—The Corporation have asked the Baths Committee to report as to the installation of filtration plant at the baths. Land is to be obtained for the erection of flats.

GUILDFORD.—The Onslow Village, Ltd., are to erect 100 houses. The E.C. recommend the purchase of 5½ acres of land from Onslow Village, Ltd., for £1,100, as a site for a new public elementary school.

GUILDFORD.—The Sanitary Committee are to consider the provision of public conveniences at the Stoke Recreation Ground.

GUILDFORD.—The Housing Committee have under consideration the erection of flats on the Aldershot Road Estate.

HAMMERSMITH.—The Borough Surveyor, having prepared sketch plans and an elevation for an extension of the Town Hall, has now been instructed to proceed with the preparation of the plans and detailed estimates for submission to the B.C.

HAYES.—Plans passed: Mackenzie & Sons, 64 houses, North Hyde Road and Sandow Road; Great Western Garden Village Society, 50 houses, Minet Drive; Mr. S. L. M. Avery, 24 houses at Yeading. A scheme is also being prepared for the erection of 520 houses by private enterprise in Yeading Lane and High Road.

HESTON-ISLEWORTH.—Plans passed: Messrs. Building Enterprises, Ltd., 30 houses, Spring Groves Crescent; Mr. P. F. E. Carter, 16 houses, Cranbrook Road; Messrs. Perry Bros., 3 shops, Spring Grove Road, and 3 houses, Vicarage Farm Road; Mr. J. Montgomery, 12 houses, Whitton Dean; Messrs. Cartwright & Son, 27 houses, Parkside Estate; Messrs. W. Harbrow, 42 houses, Victoria Garden and Alexandra Gardens, and 38 houses, Summerhouse Avenue and Alexandra Gardens; Mr. P. Watkins, 4 houses, Great West Road extension; Mr. H. Allen, 46 houses, Bulstrode Avenue; Messrs. P. Chase Gardener & Co., Open Market, Bell Road, two shops, Heston Road, two houses, Twickenham Road,

four houses, Alexandra Gardens, and six houses, Sutton Lane; Messrs. Parkwood Development Co., 6 houses, Wood Lane; Messrs. Roper, Son & Chapman, 3 lock-up shops and 2 flats, Thornbury Avenue, and 4 shops at Bath Road.

HORSHAM.—The U.D.C. has instructed the surveyor to prepare a scheme for the erection of 20 houses.

HULL.—The Corporation is to seek sanction for a loan for the erection of 558 houses, at an estimated cost of £226,573, this to include street works. The Finance Committee have approved the expenditure of £24,000 on other street works preliminary to the building of a further 500 houses.

KINGSTON.—Work is about to be commenced upon the schemes which provide for the erection of a Nurses' Home and other buildings. Plans have been prepared by the architect, Mr. F. Danby Smith.

KINGSTON.—The B.E. have approved a site in the London Road, Kingston, for the erection of the new Tiffin Boys' School.

KIRKCALDY.—The D.C. is to proceed with the erection of 396 houses within the Kirkealdy district, and application is to be made for consent to the proposal, which is estimated to cost £158,400.

LEICESTER.—Extensions are to be made to the Technical College, the proposals by the Leicester E.C. having been approved by the B.E.

LEYTON.—At the last meeting of the Essex E.C. the final plans for the proposed County High School for Boys at Leyton were approved for submission to the B.E.

LIVERPOOL.—Extensions are being carried out at the factory of Messrs. Barker & Dobson, Liverpool chocolate manufacturers.

LYMM.—The Council has acquired a site in Pepper Street for the erection of 20 new houses. Twelve of the houses will be of the non-parlour type, and the price is £25 per house lower than the last houses.

MERROW.—Negotiations between Mr. C. A. Burlingham, architect, and the trustees of the Hospital of the Blessed Trinity, Guildford, have resulted in Mr. Burlingham purchasing, at over £13,000, areas of land on the south side of the main Guildford-Leatherhead Road, on which he proposes to erect houses of a country residential character.

MOLESEY.—The M.H. held a inquiry last week into an application of the U.D.C. for powers to acquire, compulsorily land in Green Lane, for the erection of 74 houses.

NEWCASTLE.—Messrs. J. Walton Taylor & Son, Newcastle, have prepared designs for extensions at St. Mary's Training College, Fenham, Newcastle, estimated to cost £8,000. Messrs. John Jackson & Co., Newcastle, are the contractors.

NORTHAMPTON.—The Borough Engineer is to prepare a scheme for the development of the Weedon Road site, where A3 and B3 houses are to be erected. Tenders are to be invited for repairs at 240 Council houses. Alterations are to be undertaken at the market, at a cost of about £400. Plans passed: 14 houses, Gipsy Lane, for Messrs. A. L. & H. W. Chown; 20

houses, Lloyd Road, for Northampton Co-operative Society, Ltd.; 14 garages, Grafton Street, for Mr. H. Weatley; warehouse, Lea Road, for Messrs. J. Sears & Co., Ltd.

NOTTINGHAM.—The Nottingham Corporation Housing Committee recommends that the contract entered into for the erection of 1,000 steel and concrete "Crane" houses at Woolaton Park, at a cost of £591,366, be allowed to go forward.

OAKENGATES.—The U.D.C. have decided to proceed with the erection of 12 more houses.

PENKRIDGE.—Plans have been prepared for the proposed new Wesleyan Church, to cost between £1,600 and £1,700.

PRESTON.—The E.C. has approved plans for an extension at the Park School, at an estimated cost of £1,500.

PRESTON.—The Watch Committee recommend that the plans of the proposed Strand Road Police Station, to be erected on a site adjoining the Wheat Sheaf Hotel at an estimated cost of £1,600, be approved and submitted to the Home Secretary for approval.

QUARRY BANK.—The U.D.C. have proposed a third housing scheme, and the sanction of the M.H. to the acquisition of the land and to the borrowing of the money has been received.

RETTFORD.—The T.C. propose to erect another 20 non-parlour type houses in Leafield Road.

ROTHERHAM.—Plans have been prepared by the Rotherham Borough Engineer for the reconstruction of Chantry Bridge, at an estimated cost of £75,000.

RUISLIP.—The U.D.C. propose erecting four cottages on the depot site in Pinner Road, and two at the Sewage works.

ROWLEY REGIS.—The D.C. approved the lay-out plan of the surveyor for a housing site on the Stile House Farm and the Church Farm.

SEAHAM HARBOUR.—The U.D.C. suggest a site in New Yard for the erection of a mortuary, and tenders are now to be invited. A scheme is to be prepared for the erection of further houses.

SHEFFIELD.—A new picture palace is to be erected on the Manor Housing Estate, Sheffield. The building has been planned by a Newcastle firm of architects, who have designed nearly 50 similar structures. The building contract has been placed with Messrs. Gleeson, of Woodseats, Sheffield, and work is to be begun almost immediately.

SHEPPERTON.—The Staines R.D.C. have approved a scheme for the erection of 20 houses at Shepperton.

SKEGNESS.—The Skegness U.C. have instructed their surveyor to prepare prints of a proposed scheme for the complete reorganisation of the whole of the sea front.

SOUTHEND.—The T.C. are making application to the B.E. for sanction to erect a new school on the Fairfax Drive site, at an estimated total cost of £24,500.

SOUTHEND.—Plans passed: 124 houses, 98 garages, 4 shops and houses, additions to mineral water factory, and new school chapel.

A SUGGESTION

MAY we suggest that before purchasing Fireplace Suites or Sanitary Appliances you and your Clients should visit our recently re-arranged Showrooms at 17 & 18 Upper Thames Street, London, E.C.4.

The range of Fireplace Suites offered for inspection is a very wide one. A special feature is the number of beautiful Period Designs, many of which we owe to our own craftsmen of a century ago.

The Register Grate illustrated is in Armour Bright finish and fitted with the Hot Hearth Fire. It is particularly suitable for office or country house use.

Building Trade Wages

A meeting of the grading committee of the National Joint Council for the Building Industry was held recently.

Claims, totally over 100, for the up-grading of towns throughout the country, entitling building trade workers to higher wages, were submitted. Under the recent national agreement which stabilized wages until August, 1927, it was provided that all existing applications for up-grading should be automatically dealt with, but that new claims could not be made till next October. Approximately 70 per cent. of the towns throughout the kingdom so far are included in Grade A, which carries the top rate of pay, and these were not affected by the negotiations.

Alteration in Slate Count

It has now been decided by the London merchants and roofing contractors who handle slates in and around London to offer all slates, except those randoms usually sold by the ton, at per thousand actual, thereby eliminating such terms as "long count" or "long tally." It has not yet been possible to induce provincial merchants and factors to adopt the same procedure, but hopes are entertained that shortly the rest of the country will follow London's lead and so mark a definite step in the unification of "count" in one of the important branches of the building industry. To allay any misapprehension or suggestion that this alteration will affect prices, it is desired to make it perfectly clear that the alteration will not, in any case, increase the cost to the consumer, as prices (where they have hitherto been sold on a 1,200 basis) will be adjusted on a pro-rata basis. It is hoped that buyers of slates and all those interested in their distribution will do their utmost to make this change of policy widely known.

The White Hart Estate.

The Salvation Army propose to build a new hall on the White Hart Housing Estate, and are acquiring a site on the corner of two new roads. Plans for the building will be prepared by the Army's architects' department at 199 Queen Victoria Street, E.C.4.

Moisture Movement through Wood

The Board of Trade Journal states that this,* the second Technical Paper of the Forest Products Research Laboratory of the Department of Scientific and Industrial Research, deals, like the first,† with the movement of moisture through wood. The importance of experiments on this subject will be appreciated when it is realised that success in the kiln seasoning of wood can only be attained with a thorough knowledge of this process. The experimental results obtained should assist the kiln engineer, since they emphasise those features which must be taken into consideration in kiln design if artificial seasoning is to be an efficient and economical practice.

Birmingham Civic Centre

The City Council are to consider a proposal by the General Purposes Committee, who are in favour of the purchase of the freehold of the site of Bingley Hall. Bingley Hall, which is by far the largest hall in the City, is held on lease by the Birmingham Agricultural Society, and is regularly used for trade and other exhibitions. The Hall, which was erected in 1850, has an area of 65,932 feet, and adjoins the Prince of Wales Theatre.

Cardiff Housing

According to the *Lancet* the proportion of houses in Cardiff occupied by members of more than one family is about 28 per cent. A sample of 3,112 of such houses showed that in 402, or 13 per cent., there was mixing of the sexes over 13 years of age—a rather high age—in sleeping-rooms (exclusive of married couples). If the same proportion holds for all the 11,000 multiple tenant houses, the number sex-overcrowded amounts to 1,420. Sex-overcrowding is, however, not confined to multiple tenanted houses, and it is estimated that in the city at present there are about 2,000 sex-overcrowded houses.

Unity of Builders

The General Council of the Trades Union Congress has called for January 28 a conference of all affiliated unions associated with the building industry to discuss the question of closer unity in the building trades.

Brixton Police Housing.

A scheme has been prepared for the erection of houses for the police on the site of the Brixton Orphanage at a cost of £177,000, approval having been given by the Home Secretary.

Trade Notes.

Messrs. W. Smith, Stodart & Son, asphalt contractors, have, in order to cope with the expansion of their business on the south side of the river, opened new premises at Deptford.

Housing steps to strings, each	9d.

Super!

The Convertible Grate idea reaches its zenith in our latest production—The “**SUPER INTEROVEN**”

(Pascall's Patent)

SPECIALLY DESIGNED TO MEET THE REQUIREMENTS OF HOUSING ARCHITECTS AND WITH CAREFUL REGARD TO THEIR EXPRESSED OPINIONS UPON ALL TYPES OF CONVERTIBLE AND COMBINED STOVES

The 24-inch “**SUPER INTEROVEN**”
as an Open Fire. Mantel No. 13

The 24-inch width “**SUPER INTEROVEN**” cooks for 12 persons and has an oven larger than any other Convertible Stove, being the same size as in the 35-inch width model, but without the side Hot Closets. It can, however, be supplied with Hot Closet under stove for light cooking as illustrated above.

Boiler heats a 45-gallon Tank or Cylinder.

FLUES EASILY CLEANED
WITHOUT REMOVING OVEN

REDUCTION IN PRICE.

The ORIGINAL 20-inch “**INTEROVEN**” has just been reduced in price from £9 to £8 5s. 0d.

GLOW-WORM**ADVANCE
IN
PRICES***Effective from December 1st*

We very much regret that, from Dec. 1st, we shall be compelled to raise the prices of Glow-Worm Boilers.

For some months past we ourselves have been bearing the heavy additional costs of manufacture resulting from the Coal Dispute; but still further increased costs of raw material and manufacture compel us to notify the trade that from Dec. 1st our prices will be as set out hereunder. We will notify the trade when we are in a position to fore- cast reductions and so enable them to clear their stocks

NEW PRICES

Minor, complete with tray and feet	£9 10 0
New Junior, complete with tray, feet and ashpan ..	£11 10 0
No. 1, without tray and feet and ashpan	£13 10 0
No. 2, without tray, feet and ashpan	£15 10 0

HARD WATER THE CONSTANT ENEMY OF HEALTH

Gout, Rheumatism, and Calcareous diseases generally are aggravated by hard water, and the water softener is in consequence, an important item in the equipment of a modern house. Not only does it promote health and comfort, but it also makes possible a considerable save in soap, soda and tea.

Leading Architects Specify—

BUILDING WAGE GRADES

Grade Classification	A	A1	A2	A3	B	B1	B2	B3	C	C1
Standard Rates	1/8	1/7½	1/7	1/6½	1/6	1/5½	1/5	1/4½	1/4	1/3½
Labourers' Rates	1/3½	1/2½	1/2½	1/2	1/1½	1/1½	1/1	1/0½	1/0½	-/11½

The following are the gradings of towns in England and Wales. The rates quoted apply to all craftsmen, with the exception of those marked with an asterisk, which denotes that there is a differentiation in the rate paid to painters, details of which are given separately at foot. The London rates are:—Within a 12 mile radius from Charing Cross—all craftsmen (excluding painters), 1s. 9½d.; painters, 1s. 8½d.; labourers, 1s. 4½d. From 12 to 15 mile radius, all craftsmen (excluding painters), 1s. 9d.; painters, 1s. 8d.; labourers, 1s. 4d.

THIS IS AN ABRIDGED LIST; THE GRADINGS OF OTHER TOWNS MAY BE HAD ON APPLICATION TO THE EDITORIAL OFFICE OF THIS PAPER

LAND VALUES IN TOWN PLANNING

The paper read by Mr. F. G. Baxendale at the Surveyors' Institution last Monday was of more than ordinary interest. To all those engaged on town-planning work, or in estate development, his study of the progressive stages of a town-planning scheme, and their effect on values, will be illuminating. Unfortunately, pressure on our space would not permit more than a brief excerpt from the paper, and, in view of its highly detailed character, such an excerpt would hardly do justice to the subject. For a full account, therefore, we must refer readers to the Institutions' Transactions. Mr. Baxendale considers a town-planning scheme as having four definite stages. The first starts with the Resolution of a council to apply the provisions of the Town Planning Act to a defined area, a stage that has no effect which can be measured upon the value of land in the selected area. A good deal of preparatory work may be desirable, however, on the part of owners and their Surveyors; as for example, where land is ripe for development, a plot plan of the estate should be prepared in order that discussion may be immediately initiated on the provisions of the scheme as to density, roads, etc. Close co-operation between the Council, the owners and their surveyors at this stage, when the scheme is being prepared, will obtain the best results for both parties. No claim for compensation or betterment can yet arise. It may be likened to a fall of the barometer foretelling rain, possibly of compensation to the owner, of betterment to the council, and, one may hope, satisfaction to all.

It is during the second and third stages that matters rapidly develop, that is (a) from the date of the preliminary statement to the date of its approval by the Ministry of Health, and (b) from the date of the draft scheme to the date of its approval by the Ministry of Health. During both stages, the scheme is gradually being modified and modelled into its final form. A Council may sometimes run both stages into one, however, proceeding direct from its resolution to its draft scheme. At (b) a public local enquiry is always held, when the owner has the opportunity of advancing his views, although he would be better advised to get them before the council during stage 1. A second local inquiry is also held before the draft scheme is approved. But the adoption by the council of the preliminary statement immediately affects the value

of all the land in the scheme, in some cases to a marked degree. Right to claim compensation does not arise, although some of the provisions included carry that right, until the 4th stage or final confirmation of the scheme. The important points are that, under the terms of the Act, property shall not be considered as injuriously affected by provisions relating to Zoning: Character; density; Space about buildings; or Height of buildings. Any attempt to secure any alteration or remodelling of the requirements in these matters must be done at this stage, either by coming to agreement with the promoting authority or by appeal to the Minister. Mr. Baxendale has a long list of possible difficulties or injustices, from the landowner's point, which may be encountered under these respective heads. It is, no doubt, through our haphazard system of urban expansion in the past that many of these difficulties have arisen, and possibly also to the exaggerated values which commercial firms are often prepared to pay. The root trouble has always been to determine a basic price for land; a matter that no one has ever been, or ever seems likely to be, able to determine. We have often heard of extraordinary differences in the prices paid for industrial land, although the transit facilities, water supply, proximity of workers and all other important factors in this connection, appeared to be equal. Differences might be explained where housing was involved and one area possessed natural amenities that another lacked; but industry is not concerned with natural amenities. Such variations can only be explained by the stupidity of buyers and the astuteness of sellers; but they may have very unfortunate results from the public standpoint in setting up a general standard of false values. The regulations affecting height, Mr. Baxendale believes, must profoundly modify the planning of new industrial centres and "must of necessity affect land values to some extent; they involve the acquisition of more land for each industrial building, and, while tending to increase the amount of land sold and the consequent turnover, may result in reducing the price." This, however, ignores the fact that modern factory design shows a decided tendency to revert to single or two-storey buildings of light construction, as not only more economical in construction but easier for efficient working. Heavy machinery is best placed on the ground; when it

has to be piled up in floors, constructional costs are enormously increased. The regulations are hardly likely to be viewed by the factory owner, therefore, as "a deterrent to the tendency to move industry into rural and urban surroundings."

The "restrictions as to density, space about buildings and height of buildings must, of necessity, result in the development and use of a much larger area of land, for the same number of buildings, than has been the case in the past." It is at this point Mr. Baxendale starts to make our flesh creep, by calculating that, if the land continues to be taken from agriculture for building at the same rate as in the decade before the war, there will be no agricultural land left to us in 1,000 years. Presuming that population and trade maintain their present rate of increase, the restrictions of the Town Planning Act mentioned, involving the taking of more land for the same ratio of building, will reduce that period, at a modest estimate, by from 25 to

30 per cent. So that Great Britain, in, say, from 600 to 700 years, looks like being entirely built up. Mr. Baxendale disowned any idea of depriving his hearers of sleep by "raising this bogey," which he used to emphasise the fact that "by the passing of the Act and each resolution thereunder, land has become a much scarcer, and therefore, more valuable, commodity owing to its strictly limited extent." This last argument seems almost a gift to the advocates of land nationalisation, though we would not suspect Mr. Baxendale of favouring their contentions. Much, however, may happen in 600 or 700 years to dispel these lurid prognostications. It is more likely, if Britain survives, that long before it reaches the "built-up" stage, traffic congestion will have caused such an emigration or extermination of the inhabitants that Mr. Baxendale's successors will be calculating not how high the value of land will rise, but how low it is likely to fall.

Notes and Comments

Mr. Oliver Hill

Our apologies are due to this well-known architect for a typographical error under the illustration of the Studio for Sir Barry Jackson on p. 41 of our New Year's issue, by which his name appeared as "Oliver Hall." Details have appeared in the Press during the last few days of Mr. Hill's decorative scheme for the largest suite at the new Devonshire House, in which he is employing the services of Mr. Edmund Dulac, Mr. Philip Connard, A.R.A., and Mr. George Sheringham. According to an interviewer of *The Evening Standard*, Mr. Hill finds that "when people in England decide to take a house and have it designed and fitted by an architect, he submits modern and original plans." They may like the design, but when they ask where they can see something like it and are told, "Nowhere; it is all original," they go to the usual decorative contractor and give him *carte blanche*. Mr. Hill's client at Devonshire House has, fortunately, more vision and more faith. Although many and costly decorative materials are being used in the scheme, simplicity is to be the keynote of the treatment. It is pleasant to hear of an architect undertaking the decoration and equipment of homes, which were once the prerogatives of his profession, and availing himself of the services of distinguished artists in his schemes, as his 18th century predecessors used to do. It is the more gratifying that such an opportunity should have fallen to an architect so eminently capable of making notable use of it.

The London Architecture Medal, 1926

The Jury will be meeting shortly to select the best London street frontage, erected during the past three years within four miles of Charing Cross, for the award to its designer of the medal and diploma which the R.I.B.A. has instituted for encouraging excellence of design in street architecture. With such a vast area as the four miles radius represents, and the immense amount of re-building now going on in it, one of the difficulties which confronts the Jury is to be sure that they have before them particulars of all the buildings which should rightly be considered for this distinction. Modesty forbids most men from drawing particular attention to their own work, and others capable of understanding and appreciating it rarely have opportunities of actually seeing more than

a few of the meritorious buildings. In these circumstances, we put forward a suggestion that we do not think will be unwelcome to the Institute authorities, viz., that our readers might like to nominate buildings which they think deserve the award of this particular honour. In such case, if they will send particulars to us, we shall be happy to forward them to the right quarter. It is probable that many will put forward either the same buildings, or buildings which have already been nominated, but it is possible that by this means a very good piece of design may be unearthed. It should be borne in mind that it is not only large and important buildings that are eligible for consideration. In sending particulars, we would ask correspondents to give the exact location of the building and the name and address of its designer. If they can supplement the particulars with a reasonably good snapshot or sketch of the building, so much the better.

Greater London Planning

The local authorities in the Greater London area have been asked by the Ministry of Health to agree to the appointment of a Committee to consider and make suggestions for the future planning of an area having a radius of 25 miles from Charing Cross, covering an area of about 2,000 square miles. This request is the outcome of the recent conference of 154 local bodies held recently under the ægis of the Ministry; and it will now be necessary for these bodies to pass the formal resolutions required to put the formation of the joint committee in train. It is a tribute to the foresight and energy of the Minister that the co-ordinated effort which is required to deal with this aspect of London's affairs seems likely to be established, for, as stated in the Ministry's letter "the formation of a committee of this kind is urgently required if the problems connected with the development of London and the surrounding area are to be adequately considered. Without a comprehensive consideration of these problems, by a body representative of the local authorities, he (the Minister) believes that it will be practically impossible to avoid difficulties which, sooner or later, must involve the expenditure of large sums of money." It should be noted that this central committee will not supersede the regional committees but will help to co-ordinate their labours.

Fig. 1.

THE TWENTIETH CENTURY HOUSE

II.—The Æsthetics of Sanitation

By A. TRYSTAN EDWARDS.

How to accept the standard of sanitation now considered requisite in domestic architecture and while accepting it still maintain a quality of seamliness in the façades of houses—that is one of the principal problems to which the artist must address himself. Now the plumber is an important personage, and he performs a great work which is necessary to our civilisation. I do not speak now of the actual person who lays drains and can show his skill in wiping a lead joint, but rather of that “high-brow” plumber who with a voice of authority ordains that the dictates of hygiene must be obeyed in such and such a manner, that bathrooms and closets and sinks shall be of a certain definite number and type and shall be disposed in accordance with principles formulated by himself; I speak of that ruthless and determinant fanatic, half doctor and half engineer, who would impose upon architecture any kind of obligation or restriction, no matter how it affected the forms of building, so long as the cause of hygiene was advanced thereby. Let it be said at the outset that this high standard of hygiene is something worth striving for even if architecture suffers severely through its attainment. It is a matter of the highest æsthetic importance that hygiene should be served. Unhealthy buildings tend to cause a decline in physique, an *uglification* of the people who inhabit them, and hygiene is not related æsthetically to architecture, but to that superior art which has to do with the cultivation of human beauty. I am at pains to insist upon this in order that I may not be accused of failing to understand and appreciate the mission of the exalted “plumber” who takes architecture in his grip and would mould it to his own

will. He is determined to make architecture serve hygiene, and few people born in the twentieth century are likely to resist his purpose.

Like every other object belonging to the visual arts, a house consists of Subject and Form. The subject of the house is its social use or purpose, and its form is dependent upon that organic relationship between its parts by virtue of which it possesses beauty. It can scarcely be denied that there are beautiful houses which are unhealthy to live in, and there are very ugly houses which are well lit and ventilated and have excellent drains and plumbing. In the first case the form is elegant, but the subject has a great blemish, while in the second the form is poor but the subject, in so far as it expresses the subservience of architecture to hygiene and incidentally to the art of the cultivation of human beauty, is commendable. It must be affirmed, however, that even in this latter example the subject is not perfect, because the house, while being rich in one element of the æsthetic content proper to a building, is deficient in another, and here I may complete my reference to the “hierarchy” of the visual arts by declaring that architecture owes fealty not only to the art which is concerned with the health and beauty of human beings, but to the important social art of manners. When architecture ignores the first of these arts it becomes unpractical and unhygienic; when it ignores the second it becomes vulgar. What much of domestic architecture suffers from to-day is a vulgarity due to the fact that while admirably serving hygiene it neglects at the same time to serve manners. Very many of our modern houses display too blatantly the soil pipes, ventilating pipes and waste pipes and the

Fig. 2.

Fig. 3.

small windows characteristic of bathrooms and closets, with the result that these necessary features seem to dominate the façades and prevent us from dwelling upon other and more important spiritual aspects of the buildings. After all, health is not an end in itself; it is but the means to a complete life, and it is this life in its entirety which architecture should serve. It is therefore fitting that those features instrumental to the attainment of hygiene should, if possible, be characterised by a reticence of demeanour, and have a certain seemliness and even a beauty of their own appropriate order. How to achieve this object is the special purpose of the first part of this series of articles on "The Twentieth Century House," for I believe that this particular century, while it has already witnessed the attainment of an exceedingly high standard of hygiene, will also see the return of manners to architecture.

"The aesthetics of hygiene!" "What is this?" it may be asked. It is the art of preventing hygiene from assuming the guise of ugliness. In architecture this sub-division of aesthetics is particularly concerned with the problem of how to arrange the small windows and obtrusive pipes associated with bathrooms and closets in such a manner that they do not spoil the appearance of the façades. At first sight such a problem seems unworthy of the effort and of the space which I am now proposing to devote to it, but yet one need only consider our urban architecture as it is seen from a railway carriage, or visit any of the new suburbs or the more rural residential areas which are being rapidly developed to-day to realise the magnitude of the offences which have been and are being committed in the name of hygiene. I will make bold to say that at least half the ugliness which

now disfigures our towns and rural districts is directly due to this very omission to establish order and decency in the arrangement of the features I have named. It does not seem an exalted or inspiring task to devise a system of planning directed especially to this object, but it is none the less a necessary one. And although the task is humble and singularly unattractive to those designers who like to apply themselves only to the "grand" things of architecture, its execution will perhaps have results not without interest even to the purveyors of "style" and "beauty" in building. A certain formal symbol will be created, which although capable of use and adaptation in countless different ways, will nevertheless emphatically set its mark upon all the buildings with which they are associated; and this mark will be one of the authentic marks of the twentieth-century house.

The labour we must now perform is comparable to that labour of Hercules, the least heroic of the labours which he was called upon to undertake. For in the domain of architecture there exists an equivalent of those Augean stables which so badly need cleansing.

The illustrations which follow will be freely chosen from large or small houses, detached or in groups, from flats or maisonettes or any other type of dwelling. My object in the first section entitled "The Aesthetics of Sanitation" is not to treat of domestic architecture in categories of accommodation or general plan, but to concentrate upon the relationship of the living rooms to the smaller domestic offices and the external expression of these latter. Other aspects of the twentieth-century house will be discussed in three succeeding sections of chapters on sanitation.

Let us begin by glancing at a quite orderly plan for a flat. For economy the plumbing is concentrated in as small a space as possible. The corresponding elevation has a blemish comparable to that of Fig. 3. The arrangement of the domestic offices is convenient but yet their expression on the façade is extremely ugly. What can be done to mitigate the offence? Figs. 1 and 2 show a solution of the difficulty, for here the windows of these apartments are grouped around a feature which I here describe as a "Recess." By this means adequate light and ventilation are secured, the fenestration is orderly and the pipes are hidden by the slight projection of wall at the opening of the recess. The placing of these pipes is shown on a larger scale in Fig. 4. Externally the façade appears as in Fig. 1, and it will be seen that while the demands of hygiene have been satisfied, just as well as in Fig. 3, an attempt has been made to achieve order and dignity in the design.

The "Recess" is capable of a highly varied development, and I propose in subsequent articles to illustrate some of its possibilities.

Fig. 4.

THE TAUNTON SCHOOL MEMORIAL. E. VINCENT HARRIS, F.R.I.B.A., Architect.

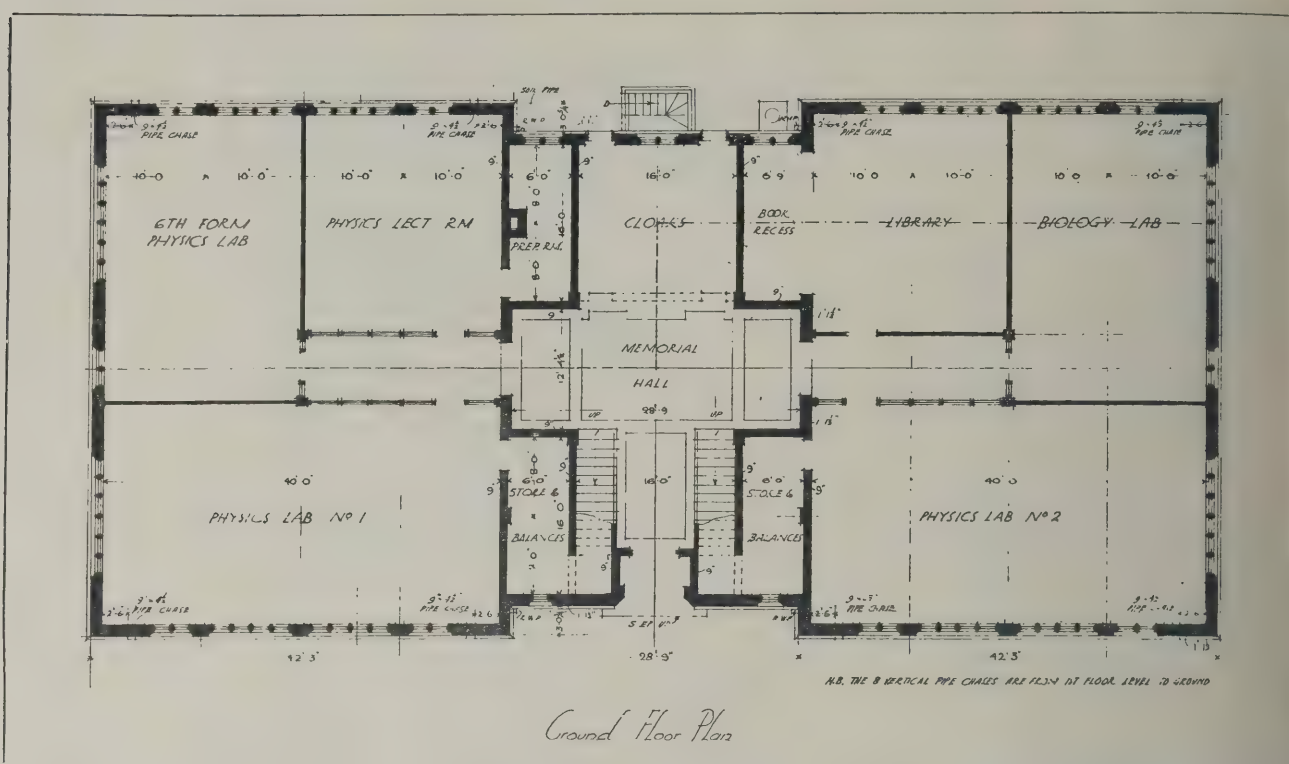

THE TAUNTON SCHOOL MEMORIAL

This building, designed by Mr. Vincent Harris, is an interesting example of the way in which a mediæval style can be adapted for modern usages. What we have here is a simplicity and directness of treatment which are essentially of the twentieth century. It is easily explicable, however, that those who erect school buildings should show a preference for the mediæval style because the Oxford and Cambridge colleges are for the most part built in that manner. If a new school can establish even a slight architectural affinity with those famous seats of learning it is sure to gain a certain prestige thereby. It is perhaps a remarkable circumstance that the masterpieces of the Classic style which are also to be found among the colleges of Oxford and Cambridge have had little influence upon the design of school buildings of to-day. In the present instance, however, the memorial building has certain elements commonly associated with Classic exemplars, while it is chiefly in its detail and ornament very sparingly employed that it reminds us of a pre-Renaissance convention.

Let us first consider the plan. It is here apparent that the originators of the scheme considered that the memorial should take the form of a block of

buildings for the housing of certain school rooms and that the actual memorial hall should be of quite modest dimensions. This seems to be an excellent compromise, because through its adoption the benefactors of the school have secured a much needed increase to its accommodation, while at the same time the commemorative quality of the building is sufficiently emphasised. On the ground floor one enters the memorial hall, a rectangular chamber which not only gives access to a handsome double staircase, but also contains the doors leading to all the apartments on this floor. Thus it is apparent that the very maximum economy of space has been obtained. On either side of the staircase are Physics laboratories; whilst the range of rooms at the rear of the building include a physics lecture room, a library, a room for the study of biology, and also an ample cloak room immediately opposite the entrance. On the first floor are chemical laboratories, a chemical lecture room, and a masters' common room, all admirably arranged. The illumination is everywhere excellent, large windows being provided, supplemented on the first floor by top lights.

Externally, the architect has aimed at the achievement of a composition characterised by simplicity and

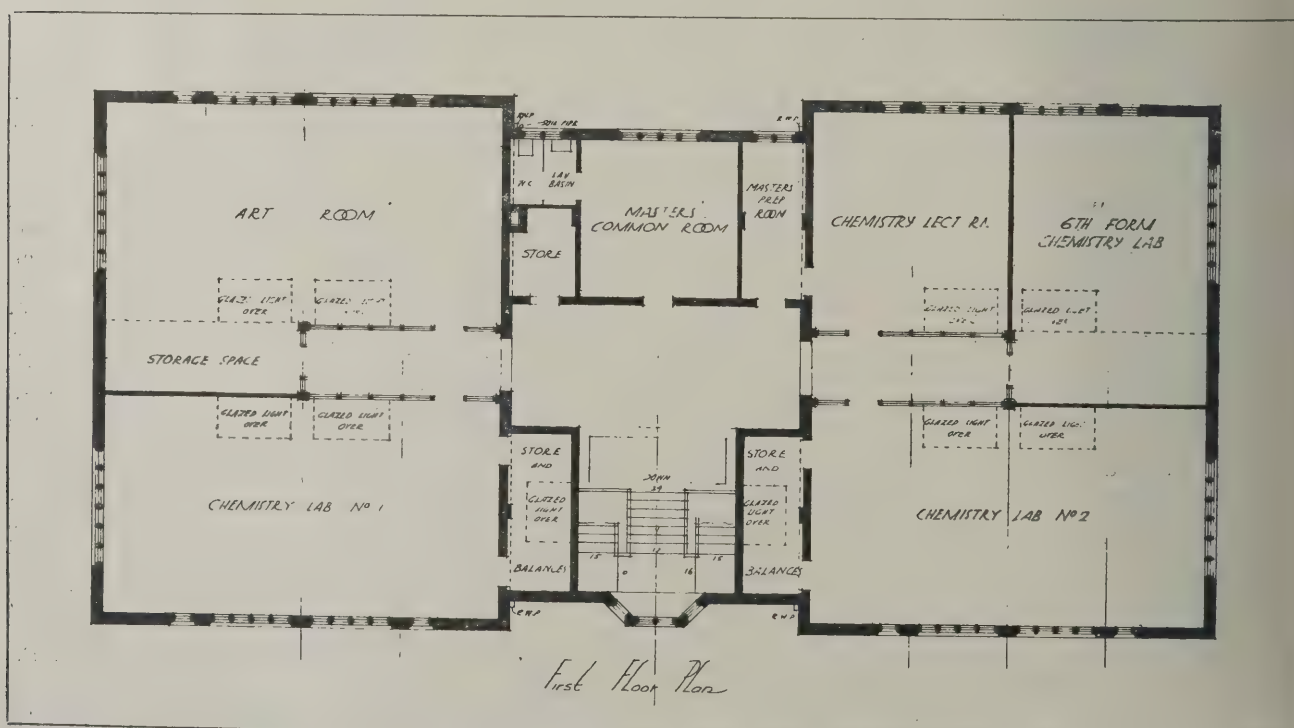

TAUNTON SCHOOL MEMORIAL.

E. VINCENT HARRIS, F.R.I.B.A., Architect.

order. The front elevation consists of two symmetrical blocks bearing the obvious stamp of a utilitarian purpose, joined together by the central member of the composition, which has the entrance doorway with pointed arch and fine oriel above which very successfully gives just the right note of elaboration and ceremony which the idea of the memorial seems to require for its expression. The building owes much of its excellence to the long eaves of the gabled roofs, the lines of which are supported by parapets underneath which tend to unify the building and to prevent the two wings from asserting their individuality too prominently. It is easy to imagine that had the gables been replaced by hipped roofs each wing would have possessed so marked a particularity of form that the

central feature could not possibly have restored them to a common denominator. Even as it is, it may perhaps be suggested that the symmetrical formation of the windows about a central axis bisecting the façades of the wings, does something to make the latter a trifle too self-sufficient. Each wing lacks the organic quality of being one of a pair which, characterises the wings of a butterfly. It is noteworthy, however, that, considering each wing separately, the fenestration has the virtue of having the first floor windows of much less vertical dimension than the ground floor ones; this ensures that the two storeys, instead of being in conflict owing to their being of equal value, are so disposed that the upper is subordinate to the lower and thus forms a unity

TAUNTON SCHOOL MEMORIAL.

E. VINCENT HARRIS, F.R.I.B.A., Architect.

TAUNTON SCHOOL MEMORIAL: ORIEL WINDOW TO STAIRCASE.

E. VINCENT HARRIS, F.R.I.B.A., Architect.

with it. The rear elevation closely resembles the front except that the central portion has a number of small windows serving the cloak room and other small apartments. The end elevations are homogeneous with the rest, the same type of fenestration being adopted. Again we have two symmetrical features united by a small expanse of wallage which in this

instance has but one small window on the ground floor storey.
At a time when so many buildings fail to achieve their appropriate character, the Taunton School Memorial stands out as an example of collegiate architecture admirably expressive of its function and status.

Professional Societies

The Royal Institute of British Architects

We take the following notes from the minutes of the Council held on December 13.

RECOGNIZED SCHOOLS.—The R.I.B.A. Silver Medal for Schools of Architecture recognised for exemption from the Final Examination was awarded to J. Morrison, School of Architecture, Robert Gordon's Colleges, Aberdeen. The R.I.B.A. Bronze Medal (and £5 in Books) for Schools of Architecture recognised for exemption from the R.I.B.A. Intermediate Examination was awarded to Mr. E. B. O'Rorke, Architectural Association School of Architecture. The Council approved the reports of the R.I.B.A. Visiting Board on the following schools: The School of Architecture, Glasgow; The Cambridge University School of Architecture; The School of Architecture, Edinburgh; The School of Architecture, Aberdeen; The School of Architecture, Leeds.

R.I.B.A. MAINTENANCE SCHOLARSHIPS.—The Board of Architectural Education reported the award of R.I.B.A. Maintenance Scholarships as follows: E. L. W. Davies, (Colchester), £100 per annum for three years; B. I. Day (Bideford), £100 per annum for three years; E. J. White, (Hull), £100 per annum for three years; H. Jackson, (Birmingham), £50 for the first year, £60 for the second year, £75 for the third year; A. K. Brown (Sunderland), £50 for one year; J. O. Wylson, (Kent), £100 per annum for three years (Artists' General Benevolent Institution).

UNIVERSITY OF LONDON ARCHITECTURAL EDUCATION COMMITTEE.—Mr. Arthur Keen and Mr. Maurice E. Webb were re-nominated as representatives of the R.I.B.A. on the University of London Architectural Education Committee, for the year 1927-1928.

THE SMITHSON DRAWINGS.—On the recommendation of the Literature Standing Committee it was decided to purchase the Smithson drawings for the Library and to call the collection "The Grissell Collection of Smithson Drawings."

The Final Examinations

The following is the list of the alternative problems in design for the R.I.B.A. final examinations for the year ending December 31, 1927:— (1) A design for a Maternity and Infant Welfare Centre. (2) A design for a Covered Bridge. (3) A design for a Sports Pavilion and Centre. (4) A design for an Open Air Swimming Bath. (5) A design for a Vicarage. (6) A Small Housing Scheme.

Dates for Submission of Designs in 1927:— Subject (1), February 28; Subject (2), April 30; Subject (3), June 30; Subject (4), August 31; Subject (5), October 31; Subject (6), December 31.

Southend-on-Sea Society of Architects

Members of the architectural profession recently met at the School of Arts and Crafts, Southend, and decided to form a Society for the District. Mr. Ian MacAlister, Secretary, R.I.B.A., addressed the meeting and spoke of the value of co-operation and united endeavour in professional matters, citing many instances in which the new Society could benefit the local professional interests and at the same time contribute its quota to the prestige of the architectural profession. Sir Charles Nicholson, Bt., F.R.I.B.A., was elected president, and the following were elected to serve on the council for the ensuing year: Vice-president, Mr. D. H. Burles; Hon. Treasurer, Mr. Herbert R. Cowley, F.R.I.B.A.; Hon. Secretary, Mr. D. N. Martin-Kaye, A.R.I.B.A.; Members of Council, M. Percy Hayward, F.R.I.B.A., Mr. Percy Fincher, L.R.I.B.A., Mr. Norman Evans, L.R.I.B.A., Mr. Percy Brockbank, and Mr. O. H. Cockrill, A.R.I.B.A. The council has decided, for the time being, pending future affiliation with the R.I.B.A., to adopt the same area as the South East Essex Parliamentary Division for active working purposes, and are willing to admit any members of the profession residing in or practising in this area on the membership roll of the Society. Communications should be addressed to the Hon. Secretary, The Southend-on-Sea and District Society of Architects, The School of Arts and Crafts, Dowsett Avenue, Southend.

NEW NEEDS AND MODERN NOTIONS—II

By EDWIN GUNN, A.R.I.B.A.

In the first of these articles present-day needs in the storage of domestic fuel were explored. In the present one it is intended to examine the reasonable requirements for storing food in its various common forms, and household miscellanea. It is not proposed to enter into detail as to the appropriate storage for a large country house, where a dairy, bacon store, wine cellar and such like wholesale provisions may

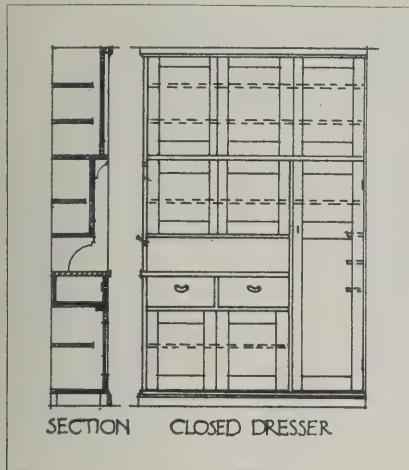

Fig. 3.

be expected, but to deal with the average modern small house within reach of shops, where perishables are replenished almost from day to day, but where, nevertheless, the conventional larder is insufficient to fulfil all needs.

Neglecting wines and spirits, which in the small house are probably sufficiently provided for by a cellarette in the Dining Room sideboard, there are classes of food which require to be kept cool and fresh and others in which dryness is the chief essential. There are also articles which though not foods yet are groceries and are perfectly well stored with foodstuffs—candles for instance. With these preliminary remarks detailed examination may be commenced.

THE LARDER.—This is properly the receptacle for raw perishables such as meat and fish, vegetables and bread, for cooked foods, and for comestibles opened and in course of consumption. Its circumstances, if ideal for this purpose, render it unsuitable for the storage of preserves, biscuits, and dry goods generally, but quite often it is the only provision. In most cases space in even the small larder is grossly wasted owing to unintelligent fitting-up, and the ventilation is not all it should be. The prime fault is too wide spacing of shelves, and the shelves themselves too broad. A height of 12 inches between shelves is usually ample and permits the utmost accommodation to be obtained in a small space, while (excepting the slate bench) a width over 9 inches results in articles being ranged two-deep which is less convenient in use than single rank. A convenient size and arrangement for a minimum built larder is 4 ft. 6 in. wide by 2 ft. 3 in. deep, the door 2 ft. 0 in. wide central on the longer side and the window opposite. A slate, tiled, or fine concrete slab at a height of 2 ft. 6 in. occupies the full area of the larder, while the ends are shelved on all three sides as above. Hooks for hanging uncooked joints should be fixed to the window head, and the space below the slab may be conveniently fitted with removable wire bins for green vegetables, supported so as to leave a space 15 inches high from the floor for skip baskets containing

potatoes and roots. To secure good air circulation it is essential to have both inlet and outlet ventilation. The window (with fly-proof perforated zinc or wire gauze, filling about $\frac{1}{2}$ of its area) being supplemented by an air brick vent near floor level, closed internally by similar gauze. Internal cleanliness and the movement of air is greatly assisted if the shelving does not make contact with the walls—it may be quite easily maintained at a distance of 1 inch therefrom if the wood batten bearers to which the shelf brackets are screwed are run continuously and the shelving left unnotched.

Similar general arrangements are equally convenient in larders of greater size except that increased dimensions permit a slate bench of adequate width without extending to the full area, so that the larder may be entered and shelving may usefully extend above the door head. Among special fitments there is an admirable fireclay larder, Watson's "Fridge," in various sizes between 41 inches by 20 inches by 17 inches and 30 inches by 18 $\frac{1}{2}$ inches by 13 inches complete with movable shelving, ventilating apparatus, and hardwood door and frame; for building-in to external walls. This is a very convenient and economical article, a great space saver, sanitary and easily kept clean. It is supplied by Duckett of Burnley.

COLD STORAGE.—A common-place in America—is making a bold bid for recognition as an essential in this country, where, however, it has hitherto been comparatively a luxury. With the new legislation prohibiting the addition of harmful preservatives to foodstuffs, it may become a virtual necessity. Attempts have been made to contrive a water-jacketed compartment in the larder, but this is an ineffective half-way house between the air-tight freezing chest and reliance on air movement or freshness; and it is liable to become dirty and neglected.

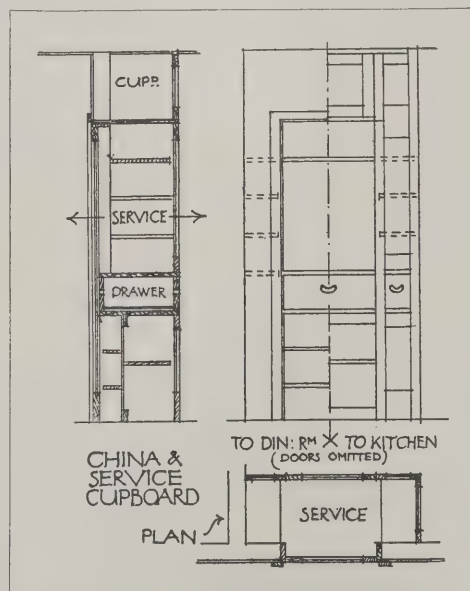

Fig. 4.

A separate refrigerator as an article of furniture is to be preferred.

THE DRY STORE.—This is now often in the form of a kitchen cabinet with a seductive name and substantial cost but it may equally well be an ordinary cupboard which should occupy a position on an internal wall. It is usually convenient to make the cupboard extend to the ceiling and to separate the

upper portion above general door-height for preserves. Ordinary fruit-bottling jars are generally about 7½ inches high by 4½ inches diam., so that a shallow cupboard with shelves spaced about 9 inches apart is suitable, and a similar spacing is equally convenient below. The economical formation of preserve cupboards over the upper part of fuel stores was mentioned in the previous article. The doors should have ¾-inch holes bored in the panels for circulation of air.

CLEANING MATERIALS.—A class of domestic necessity relatively small in bulk but increasingly many in numbers is most conveniently grouped with dry goods. Most households now possess either a suction cleaner or its humble cousin the mechanical sweeper, as well as a miscellaneous assortment of floor, furniture, metal, and other polishes, soaps, and pastes, which lack a proper home. A section of the dry-store with separate door and devoid of through shelving is a convenient provision for these articles, which require an interior height of about 5 feet 6 inches, a width of about 1 foot 6 inches, and a depth of 1 foot to contain the vacuum cleaner or "Bissell" sweeper. Narrow shelving at the back and ends of this compartment—about 4 inches wide is enough—afford lodgment for the special attachments of the cleaner and for the various tins and bottles, and also for such items as spare electric lamps, gas mantles or matches. Fig. 3 shows a closed dresser comprising this.

COOKING AND CLEANSING UTENSILS.—As regards cooking utensils the choice exists as to whether these should best be stored in proximity to the sink or the cooking stove. The decision will probably depend on the use made of the kitchen. If it is purely a working kitchen it will probably contain the sink as well as the cooker and the point will settle itself, but if it serves as a living-room, with a separate scullery, the latter is the place. The best provision is one of the open iron stands on which the saucepans stand inverted. A rack for lids is also needed. Kettles will normally stand on the stove and need no special provision.

Such articles as pails, bowls, scrubbers, and the like it will be convenient to store out of sight in cupboards below the draining boards which are on either hand of the sink—they are there handy when wanted and not conspicuous, while the space is unsuitable for a more exalted purpose. The actual space below the sink is better left open. Provision should not be omitted close to the sink for the various cleansing materials under consumption. An excellent type of

sink is made in which a drain ledge is given for this purpose and a separate sanitary tray or sill of similar material to the sink may also be obtained at a cost of 17/6. An effective arrangement which serves on occasion is to set the sink across a corner and build up a stepped "retable" of glazed or quarry tiling into the angle. The sill of the scullery window even if tiled is not an ideal provision for articles such as those now referred to. It is perhaps worth mentioning that a very sound way of supporting a sink which is placed beneath a window in 11-inch cavity walling is to omit the inner 4½ inches above the level of the sink bottom and rest the back of the sink on this wall in contact with the outer 4½ inches. The space between the window-sill and the rim of the sink when tiled makes a good cover and there is no need to fear damp from outside—it is in ample supply from within in this situation.

CHINA, GLASS AND CUTLERY.—The domestic dresser (Fig. 3), well-appointed, is certainly a pleasing object, but it is far from the most convenient way of housing the articles to which it is devoted. Many architects, working on the fact that the above articles are continually passing between the dining table and the wash-up sink now contrive their storage in such a manner that any of them can be as readily withdrawn or returned from either resting-place. This object is achieved by constructing a china-cupboard servery (Fig. 4) between the dining-room and pantry (or kitchen) with door on each face and shelving at the sides accessible from either room. Below the service top is a cutlery drawer or drawers with a "front" at each end which may be drawn either towards the dining-room or service sides. The amount of trouble and journeying to and fro saved by a fitment of this type is really great. On the pantry or kitchen side the space below the cutlery drawers and above general door-height may both be shelved as useful cupboard space, only the area from the level of the drawers to the top of the china cupboard being open to the dining-room. Plates, saucers, and flat articles generally are most conveniently stacked on the shelving one on another, cups and glasses may either stand on narrow shelves or hang from hooks in the ordinary way. The governing dimensions of normal articles are: Dinner plate, 10½ inches diameter; jug, 6 inches high; plate basket, from 1 foot to 1 foot 3 inches long, 8 to 10 inches wide, 6 inches high over handle. There is a general tendency to over-estimate the size of all common articles (witness the ancient "guessing" joke anent the height of a silk hat), and both drawers and shelving commonly waste room by too wide spacing.

Competitions Open

BIRMINGHAM CIVIC CENTRE

Competitive plans are invited, not only from this country but abroad, for the development of the future civic centre of Birmingham around the Hall of Memory. The assessor is Mr. H. V. Lanchester, F.R.I.B.A. First premium £1,000 and a further sum of £1,000 will be divided among other competitors on the recommendation of the assessor. Sending-in day, June 30, 1927. Conditions can be seen at this office.

LEAGUE SECRETARIAT AND ASSEMBLY HALL, GENEVA

Full particulars of this competition were published in our issue of August 13, 1926. Designs must be dispatched not later than January 25, 1927, and all plans reaching the Secretariat after March 31, 1927, will be disqualified.

INCORPORATED ARCHITECTS IN SCOTLAND

This competition is open for the Rowand Anderson Medal and £100, for a City Art Gallery and Museum; the Rutland prize of £50 for Study of Materials and Construction; prizes of £10 to £15 for Third Year Students in Scotland and a Maintenance Scholarship of £50 per annum for three years. Particulars from the Secretary of the Incorporation, 15 Rutland Square, Edinburgh.

PETERBOROUGH MUNICIPAL COMPETITION

In connection with the £200,000 scheme to widen Narrow Street, Peterborough, the Peterborough Town Council are considering proposals for the provision of municipal buildings on the upper floors, and at the rear of the new premises to be erected in the newly constructed street. The Council propose offering a prize of 250 guineas for the best plan submitted. A second prize of 100 guineas, and a third prize of 50 guineas will also be offered. The city engineer estimates that the erection of shops and offices will cost £82,800, and the erection of municipal buildings and shops £158,308.

NEW TOWN HALL AND LIBRARY, LEITH

Conditions and plans for this competition are being prepared. Assessor, Sir George Washington Browne, R.S.A. Particulars from City Chambers, Edinburgh.

RAWMARSH MEMORIAL

The Rawmarsh and Parkgate War Memorial Committee invite architects to submit designs for this Memorial. The cost, inclusive of fees, not to exceed £2,000. The successful competitors will be invited to act as architects for the erection of the Memorial. A plan of the site may be obtained from Mr. J. A. Tonge, L.R.I.B.A., Surveyor's Office, Parkgate, Yorkshire.

New Ways and Means

*The Editor will welcome early information of
New Plant, Materials and Fittings*

The "Abel" Flexible Drilling Cramp.
(J. H. Abel.)

A Flexible Cramp for Portable Drilling Tools

A useful mechanical accessory designed to facilitate drilling operations which have to be carried out on the job, such as the tapping of pipes, or the making of bolt-holes in partially erected structural steelwork, has just been placed on the market by Mr. J. H. Abel, of 29 Northern Road, Plaistow, E.13. This "Abel" Flexible Drilling Cramp, which we illustrate in use with a ratchet brace, provides for a continuous adjustable pressure between the drill and the work in that the tool is held down to the work by means of a chain, the links of which are set to engage with a projection upon a feeding nut fitted to the spindle of the drill. The chain and connections used are tested to a breaking strain of 1,000 lb, so that they are capable of standing up to any pressure ordinarily obtained when working upon iron or steel. The attachment is made in several modifications to suit various types of drilling tools.

New "Lead-Coil" Joint for Metal Tubes.
(Samuel Booth & Co., Ltd.)

A New Joint for Light Metal Tubes

A new "lead-coil" joint for light copper tubes, which obviates coning or swaging, has recently been introduced by Messrs. Samuel Booth & Co., Ltd., of Cheapside, Birmingham. These lead coils are fixed in caps before leaving the works, and all the fitter has to do is to cut his tube to the desired length, pass the caps containing the coil over the tube and screw up to the same tension adopted for an ordinary gas-barrel socket. By this means a lead-coil joint can be made in three minutes, or just one-fifth of the time normally taken for a taper cone joint. The tee-fitting, which we illustrate, is made in three sizes— $\frac{1}{2}$, $\frac{3}{4}$ and 1 inch—for 17, 18 or 19 gauge tube, and will withstand any pressure the tube is capable of carrying. Various other couplings are detailed in a leaflet issued by the manufacturers.

A New Woodworking Machine

A Combined Bench Planer with Circular Saw, recently introduced by Messrs. S. Wolf & Co., Ltd., of 115 Southwark Street, London, S.E.1, is shown amongst our illustrations. This machine is fitted with a self-contained $\frac{3}{4}$ -h.p. electric motor, with the starting switch placed within easy reach of the operator so that it is always under control. The circular cutter block has three blades, and the spindle rotates at a speed of 2,000 r.p.m. The plane irons are 10 in. wide, and the saw-bench attachment provides for a maximum circular saw diameter of 9 $\frac{1}{2}$ in.

A New Fixing for Wallboard

With the "Upson" Self-Clinching Fastener, introduced by Messrs. The Upson Co., of 8 Southampton Row, London, W.C.2, it is possible to fix wallboards without using nails in the centre of the panels. This fastener is made of tempered steel, roughly 1 in. square, and is provided with five prongs stamped from the body of the metal. One of these prongs is straight, but the remaining four are slightly curved to afford a clinching effect as they cut their way into the wallboard, the straight prong meanwhile keeping the panel from slipping. In practice the fasteners are nailed to the intermediate studs (or to the furring in the case of plastered walls), 100 fasteners being allowed for each 175 square feet of wallboard surface. The panel of wallboard to be applied is then put in position and nailed across the top edge, and when thus hung the fasteners are driven home by protecting the surface of the board with a padded piece of wood and striking the latter with the hammer. The edges of the panels are subsequently nailed at intervals of 6 in. and covered by panel strips. Applied in this way, the manufacturers claim that one fastener will hold a piece of $\frac{3}{8}$ -in. Upson Board in

The "Upson" Self-Clinching Fastener for Wallboard.
(The Upson Co.)

position against a dead pull of 50 lb. weight. The use of these fasteners also facilitates the removal and replacement of panels should this become necessary, in addition to avoiding an unsightly surface due to countersunk nails.

Aluminium Paint Mixed on the Job

In view of the extended use of aluminium paint for factory interiors, and bearing in mind that durability and brightness are the prime requisites for such a finish, the manufacturers of aluminium powder are urging architects to specify aluminium paint mixed on the job. The powder used should contain not less than 98 per cent. of metallic aluminium, and the copper content should not exceed 0.05 per cent. It is equally important for the medium or vehicle to be of the correct type, a slow drying varnish that is specifically "long" in oil being preferable to any other. At least 50 per cent. of this medium should consist of non-volatile substances, such as oils and gums, and the ratio of the latter should be at least 3 to 1. The medium should dry to the touch in 2 to 8 hours, becoming quite hard after a lapse of 24 hours.

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS

Mr. Boris Anrep's Paper on "Mosaics."

On Monday last, Mr. Boris Anrep spoke on "Mosaics" at the rooms of the Institute. Mr. E. Guy Dawber presided.

Mr. Anrep opened his paper with some most illuminating remarks on the peculiar character of his subject, on its history, uses and appeal. The influence exercised by this material on art had, he said, never properly been explored, despite the fact that this influence is of an intimate and important nature. The material affects us by a quality of its own, a quality which helps to form what is called the complex art emotion, but it did not remain a passive matter brought to life by the will of the artist alone; it is a potent factor able to influence creative imagination, and even determine the ultimate aim of the artist. Thus the very power of the material itself, so long as the artist obeys its laws, can save his art from being still-born. But if the artist stifles the originality of his material by forcing it to give effects foreign to its nature, the life itself of the material disappears with the worker's art.

For 500 years mosaic art had been in a lamentable condition. Since the rise of fresco, tempera and oil, the mosaic workers, fascinated by the mastery of these arts, remained satisfied to copy pictures executed in these media, and even in the 12th century, the calligraphy of the eastern miniature seduced the mosaic artist into slavery. Later they gratified their ambition by petrifying the pictures of great painters

such as Raphael or Rubens, or the cartoons in pencil and watercolour specially prepared for them after the sketches of famous artists. The elegant continuity of line, the indistinguishable gradation of tone, the fluid passages of hues of colour, and other delicacies of pictorial art, which thrive in oil and other media, were considered virtues in themselves and were carefully imitated, irrespective of the limitations of the material, for mosaic workers had learnt to make a very tour-de-force with the clumsy tesserae.

To such an extent had this enthusiasm for purely pictorial imitation developed, that at one time the workshop at the Vatican prided itself on possessing 22,000 shades of enamel cut to microscopic dimensions. These tesserae could perform at will any acrobatic feat of pseudo-painting, but in the best period of mosaic art, less than 50 shades were considered sufficient.

It might conceivably be asked to-day: is not mosaic a form of art which belongs to the past? If so, why trouble about resuscitating a dead art? There is, however, every reason why modern architecture should be interested in it: for, closely linked to architecture mosaic is essentially a monumental art. The introduction of colour into building is a problem which concerns the architect very closely, and the mosaic material is especially qualified for this purpose. The richness of its hues, the variety of its texture, its hardness, permanence, resistance to

BORIS ANREP.

atmospheric action and its capacity for reflecting light, allows mosaic to occupy the same position as the hard building materials—brick, stone, marble and concrete. Modern architecture has evolved a new type of a very large and monumental building to meet the needs of industrial and commercial organisations, and these buildings will inevitably call upon mosaic for purposes of commemoration or for purely architectural decoration.

Modern art is pregnant with ideas eminently suitable for mosaic decoration, yet mosaic establishments continue to turn out trite and uninteresting examples of this essentially vital craft without a breath of human spirit in them. Nobody is satisfied with these productions, least of all the architect.

There are two directions in which modern mosaic work requires amendment. An effort should be made to bring back mosaic to its pristine position as a means of direct self-expression, and in the second place it should be clearly recognised that mosaic decoration must abandon its pictorial arrogance and assume a subordinate relation to the needs and indications of architecture. Any surface decoration has its bearing upon the general architectural effect, but mosaic can have more influence on it than any other form of decoration. It can always be relied upon to give scintillating light and colour in dark recesses, to envelop architectural forms, to soften surfaces and edges, to create useful points of stress and repose, to deepen or flatten effects of perspective, and to compress or extend proportions.

The harmony of a mosaic decoration with its archi-

tectural environment is, however, essential. It would be a mistake to believe that mosaic need be confined to one particular style of building or one particular class of subject. Religious subjects associated with Byzantine architecture were historically, very much connected with the development of mosaic; but it is not only when events of a deep significance in religious history are treated in an appropriate spirit of hieratic solemnity that mosaic was at its best.

Vast spaces, the fascination of archways, the mystery of a dome, freizes, niches, and pavements, will always offer a enviable field for mosaic, but even in a modern suburban semi-detached villa, a mosaic medallion in the hall floor can give excellent scope for mosaic inspiration. In short the oblique statements of life which mosaic technique impose are entirely in keeping with the purpose of mural floor decoration.

After his historical resumé, which was illustrated by a most careful selection of representative work, Mr. Anrep was prevailed upon to show some examples of his own work. These exhibit a complete understanding of the limitations of the material, and, based as they are on historical precedent, indicate a distinct modern feeling.

After a short discussion a vote of thanks was put by the president, who pointed out that architects in this country seldom have the opportunity of using mosaic as a form of decoration; he wished, too, that the original colours of the mosaics could have been shown, as much was lost by representing them in black and white.

Mr. Anrep briefly replied.

The "Daily Mail" Ideal Houses Competition

The result of the *Daily Mail* Competition for small houses, to cost £1,500 and £850 respectively, was given in last Saturday's issue of that paper. The Assessors, Mr. E. Guy Dawber, P.R.I.B.A., Mr. Louis de Soissons, F.R.I.B.A., and Mr. C. W. Miskin, the contractor, had to deal with a formidable entry, numbering 1,427 designs. The premiums were awarded as follows:—

£1,500 HOUSE.

- 1st Premium. No. 21. Mr. Gordon Allen,
F.R.I.B.A., London.
2nd Premium. No. 635. Mr. Donald H. McMorran,
Harrow-on-the-Hill.
3rd Premium. No. 252. Messrs. C. J. Picton,
A.R.I.B.A., and
E. R. Knott, L.R.I.B.A.,
Letchworth.

£850 HOUSE.

- 1st Premium. No. 453. Mr. Theophile Schaerer,
L.R.I.B.A., London.
2nd Premium. No. 496. Mr. Richard A. F. Riding,
A.R.I.B.A., Kensington.
3rd Premium. No. 601. Mr. Donald H. McMorran,
Harrow-on-the-Hill.

The chief defect of competitions of this character is the fact that they ignore the question of aspect, which is, or should be, a very important factor in house design. Probably there are a good many people who still fancy that their principal living-rooms ought to face the road and the houses on the other side of the way, but they must be a diminishing number. For the rather open situations for which the detached dwellings in this competition are evidently intended, there must be many occasions where the intending building-owner is more interested in his garden than in the opposite houses; but this class of stock design rather tends to limit his choice of view. There would be less ground for criticism if such competitions were held more particularly for the selection of a designer than a design; but the tendency will be for the public to have such designs erected in all kinds of situations to which they are ill-adapted. The premiated designs are only suitable for erection for a southern aspect overlooking a road. If, by evil chance, any were erected on the south side of a road, the full sun on the kitchen and larder would make them anything but desirable dwellings for the average housewife.

The first prize design in Class A, £1,500 houses, on the whole deserves its place against the second and third. The cutting off of the kitchen department from the rest of the house is a good point, but, in a house of this size, we are inclined to give it rather less importance than the assessors have done; and, although a serving hatch is provided, we are not so sure that the arrangement will be quite handy in practice. Indeed, to provide a sort of recess for a maid, living-in, to sit and have her meals, the kitchen equipment has been uncomfortably crowded. The position of the gas-cooker, with the oven opening away from the light, is bad, and the copper flue is awkward though probably workable. Of the four bedrooms, two appear to be without any means of heating. It is always desirable that some form of fire should be provided in a maid's room, as it is not always possible, in case of her illness, to transfer her to another bedroom or to send her home. The praiseworthy desire to keep all waste-pipes at the back of the house is, presumably, the reason why there is no fitted basin in the principal bedroom. The elevation in brick, with tiled roof, is quiet and dignified, although the entrance doorway looks rather small in scale. The effect depends chiefly on the projecting

bay, which is an expensive item. Probably a re-casting of the accommodation in a rectangular plan without projections would be an improvement.

The second premium in Class A goes to a design in which the ordinary working of a household seems to have been more closely considered. The position of the gas-cooker, however, is bad; and the provision of a separate scullery for boiler and wash-tub, leaving the sink in the kitchen, does not seem quite logical. The kitchen-scullery or "working" kitchen, as it is sometimes called, is rather the product of the servant difficulty and economic conditions than an accepted ideal; and everyone would prefer to keep a sink out of the kitchen proper, especially if it must also be the sitting-room for a possible maid. The bedroom floor is well planned, but the headroom at the turn of the stairs looks a little doubtful. The entrance lobby is a rather extravagant feature in space.

The premiated designs in Class B, an £850 house, seem to show that the problems of this type have been better grasped than in Class A. The first prize design shows a good rectangular plan and a pleasing elevation. The only defect is the proximity of the front door to the stairs, which cannot be accounted a great fault, however, with the limitation of space and cost. The second premium is given to an L-shaped plan, which works out well, particularly on the bedroom floor, although the bathroom is rather cramped. The larder in this design is too small, and the coal-cellar has insufficient headroom and would not be workable.

The third premiated design in this class has the entrance at the side, and in some respects has the best plan, the scullery or working kitchen being accessible without traversing the living-room. The scullery is, however, rather cramped, and the bedroom plan, though convenient and working out well, gives smaller rooms than in the other two prize designs.

Competition Notes

Shakespeare National Memorial Theatre

The Governors of the Shakespeare National Memorial Theatre invite architects to submit designs for the Shakespeare National Memorial Theatre, Stratford-on-Avon. The competition will be open to architects of the British Isles and America. It will be in two sections—a preliminary competition for sketch designs only, from which six designs will be selected by the assessors; each of the selected competitors will be paid £100 premium towards the cost of preparing a further more detailed design, which will form the second half of the competition. The selected architect will be paid in accordance with the schedule of charges sanctioned by the Royal Institute of British Architects. Conditions of competition, with site plan, etc., can be obtained from the Secretary, Shakespeare Memorial Theatre, Stratford-on-Avon, on payment of a deposit of £1 ls. (which will be refunded should the conditions be returned within one month). Preliminary designs must be delivered to Stratford-on-Avon not later than June 15, 1927.

University of Western Australia

Competitive designs are invited for buildings to cost £150,000: the buildings to include great hall, offices, etc. Three premiums will be offered of £300, £200 and £100 respectively. Closing date, August 23. Conditions will be obtainable about the end of January from the Agent General for Western Australia, 115-116 Strand, W.C.2.

SOME ULTRA MODERN INTERIORS

The Paris Exhibition of 1925 showed, beyond a doubt, that there were a large number of firms which could claim to be producing modern furniture and decoration of a high standard, both in design and craftsmanship.

Although the individuality of designers and craftsmen quite naturally resulted in differences of treatment and character, it was impossible at the exhibition not to be impressed by the strong similarity in conception and point of view which seemed to lie at the root of a certain similarity in result. It is, of course, the general adoption of a point of view, the combined force of many artists working with the same ends in view, which finally results in the establishment of a style, and it is not an exaggeration to say that this modern French decoration and furniture has acquired the status of a style, and that when the period in which we live is later examined and classified historically, a good many of these fine modern French pieces will achieve a museum status.

The strength of this modern French movement lies in the conviction of the designers, and the technique and knowledge which make this conviction impressive.

Both the designer and the craftsman are sensitive to design values and skilful in the refinements of execution. In addition one feels the presence of a creative force which is insisting on finding self-expression and which could never be satisfied with the making of reproductions or with adaptations.

As regards the convictions of the artists, there must certainly be one common bond between them all, namely, the unquestioning assumption that this twentieth century of ours has a life and spirit of its own, and that our period has sufficient "personality" to deserve its own settings, both in architecture and furnishing. The Frenchmen who are doing this "advanced" work are most certainly products of our time. And as they feel, so do they design. If there is dislike of the result, it is less the individual than our whole era which is to blame. There are people who, like Mr. Pentz, do not seem to care for our epoch; at least, with that point of view the issue is greatly clarified, but one must also admit those who find in modern design qualities which now claim attention and will, when developed, lay claim to admiration.

The test of furniture and decoration is its suitability to purpose. It is of no use to appraise the value of a scheme of decoration by asking the test question "would one like to live in it?" Too much depends on who "one" is. There are rooms which would disturb an Englishman, but which would give a keen delight to a German Swiss. And there are undoubtedly a large number of new England ladies who would be thoroughly uncomfortable in one of Mr. Ruhlmann's salons, or in a bedroom of the type shown on page 104. There are, however, certain standards which must apply to an extent to any scheme of domestic interior decoration, and it is interesting to try and ascertain in just what measure this modern

PETIT SALON. DESIGNED BY JOUBERT AND PETIT AND EXECUTED BY DIM.

Photo: Rep.

work, like a good deal of period design, may fail to satisfy.

In the first place, it is a question whether, in most of the designs, the personality of the room has not become too obtrusive and dominant. Furniture and decoration are, after all, the constituents of a background or setting for individuals. But in these

French rooms one feels that the individual is not wanted, the room is "complete" as it stands, and has a character of almost impudent self-sufficiency. If a human being is to harmonise with these very definite schemes, he or she must be careful to conform to type; one has only to make a mental survey of one's own acquaintances to realise how many kinds

"A LADY'S BEDROOM." DESIGNED BY JOUBERT AND PETIT AND EXECUTED BY DIM. Photo: Rev.

of quite ordinary individuals there are who would most certainly *not* fit readily into these decorative pictures.

In the same way as the whole room is insistent and emphatic in its character—even, we might say, in its mood—so is each individual piece of furniture apt to strike too vigorous a note either in general movement or in the composition of its shapes. Under this head one might criticise the couch and table in the "Smoking Room," the little book stand in the "Petit Salon," and probably, also the bed in the lady's bedroom. All these pieces have interest of shape and movement, and are vigorous and decisive; they are, in a word, capably designed by minds and hands which are seeking to create an atmosphere and are not afraid of intensity of mood and emphasis of character. But these very qualities of strength result in the subordination of intimacy and charm, and that friendliness which one finds in furniture of Queen Anne or, for example, of the American Colonial period. Empire furniture and decoration and a good many other phases of Period, fail in this same respect; and the failure nearly always arises through an oversteering of effect in each individual piece, through attempting to make a small object carry a load of emphasis for which it has not sufficient importance either in function or in stature.

The furniture and decorations which we illustrate are all designed by René Joubert and Petit, and executed by the well-known Paris firm of Dim, which specialises in all branches of modern interior decorative work, from furniture and hangings, to

glass, china, and table ware. The illustrations represent specimen apartments in the firm's Paris showrooms; they do not, unfortunately, convey an idea of the workmanship and skill which has gone to the making of the furniture, fittings, and material. The standard of execution, as is the case with nearly every French firm of similar standing, is above reproach; the woods are carefully selected and finely worked, and details such as mirrors, metal work, door furniture and locks are designed and executed with the utmost skill.

The electrical fittings are of especial interest to the English architect; the use of glass of various qualities and surfaces, arranged in planes, and with the metal work often reduced to a minimum, shows an originality which is refreshing. Our own craftsmen could not fail to be stimulated by the invention and skill which goes to the making of these very modern lighting fixtures, as well as to that of the more familiar venetian lustres. An impression of the spirit which animates much of this work can be gathered in London from the little shop in Lower Berkeley Street, known as "Paris Trades." This design was executed by Dim, and it undoubtedly bears the same unmistakably Paris stamp as the firm's interior work.

There is a large number of commercial firms in Paris where one can see and buy *modern* furniture and fittings designed with sincerity and skill by artist-craftsmen whose boldness and originality is tempered by a natural refinement. When will it be possible to make a similar claim for London?

LIGHTING INSTALLATION DESIGN

XII.—Street Lighting

BY AN ILLUMINATING ENGINEER.

Fig. 47. THE TWO-WAY REFRACTOR: VERTICAL SECTION SHOWING THE ACTION OF THE HORIZONTAL PRISMS.

The question of adequate lighting for public streets and highways is to-day being forced on the attention of public authorities as never before, due to the increased traffic and the accelerated speed of modern vehicles. Many systems adopted in the past have been decidedly wasteful, first for the reason that the light distribution curve given by the ordinary electric lamp is unsuitable, being of a spherical nature, and secondly because all light emitted above the horizontal is ineffective, passing as it does into the atmosphere. The proportion of light lost in this manner frequently reaches 40 to 50 per cent. of the total.

The pioneer development in street lighting for the conservation of this upward light was in the use of a reflector, by which such light rays were collected and redirected to the street surface. Reflectors, however, whilst redirecting much of this upward light, were found to have comparatively little value in extending the light rays owing to the necessary limitation in their size. The result, therefore, is to unduly light the space directly around the lamp, leaving large spaces between the lamps with reduced lighting. Most reflectors with any pretension to efficient light control fail to project the light at a greater angle than 60° to 65° from the vertical, and this means that the maximum candle-power is thrown only to a distance equal to a little more than the height of the light source. The avoidance of sharp contrasts is therefore one of the chief points in the consideration of street lighting, particularly to the drivers of fast-moving vehicles who are unable to accommodate their vision to the rapid changes in illumination taking place. In many systems of street illumination it is quite common to find the ratios between maximum and minimum illumination intensities as great as 300 to 1.

One of the first steps taken for placing street lighting on a scientific basis was to determine the ideal

light distribution curves necessary for what is termed uniform lighting on the street surface for given ratios of spacing to mounting heights. Two ideal curves constructed on this basis are given in Fig. 46. The top curve shows the character of the necessary light distribution where the posts or lighting units are placed a distance apart equal to eight times their height, i.e., for mounting heights of 20 feet the units would be placed 160 feet apart. Such spacing would represent a very high standard of street lighting bordering on the economic limit for all ordinary types of business streets. The lower curve shows the light distribution required when the lighting units are placed a distance apart equal to twelve times their height. It is not desirable, in modern practice, to exceed such a spacing ratio, as it then becomes difficult to maintain uniform lighting. In addition, shadows become lengthy and silhouette effects are obtained, pedestrians and vehicles appearing black or nearly invisible against a fairly light background.

It being practically impossible to realise these ideal curves with ordinary globes and reflectors, the problem was solved in a practical form by the introduction of refraction as embodied in the various types of street refractor units. By this system it was found possible to obtain light distribution curves which conform extremely close to the ideal calculations previously referred to. These special refractor units consist of two elements of clear glass in the shape of a bowl. The inner element has horizontal prisms on its outer surface for the refraction of the light, whilst the outer member has vertical prisms on its inner surface for the attainment of diffusion. Both exposed surfaces are left smooth, rendering them easy to clean and maintain. Such refractors (Fig. 47) were first available in the symmetrical type giving extreme lateral lighting all round, with a maximum intensity of several times the rated candle-power of the lamp, in a zone of 70° to 80° from the vertical, which angle could be adjusted by slight alteration in the focal position of the lamp.

This type of light distribution, whilst being a decided advance over the previous types of lighting, had certain disabilities when applied to the lighting of relatively narrow thoroughfares. It follows that with the wide symmetrical light distribution a large proportion of the light rays will fall upon the vertical surfaces of side buildings and thus out of use for the illumination of the road level. It is for this reason that considerable attention has been paid to directional street lighting, whereby the light is projected at its maximum up and down the street, instead of being wasted on the frontages of buildings directly adjacent to the units, and several new forms of refractors have been evolved for such purposes.

The requirements of ordinary thoroughfares are met by the new two-way directional types, of which there are two varieties—those which project the light

SPACING DISTANCE = $8 \times$ MOUNTING HEIGHT.

SPACING DISTANCE = $12 \times$ MOUNTING HEIGHT.

Fig. 46. CALCULATED IDEAL CURVES FOR UNIFORM STREET ILLUMINATION.

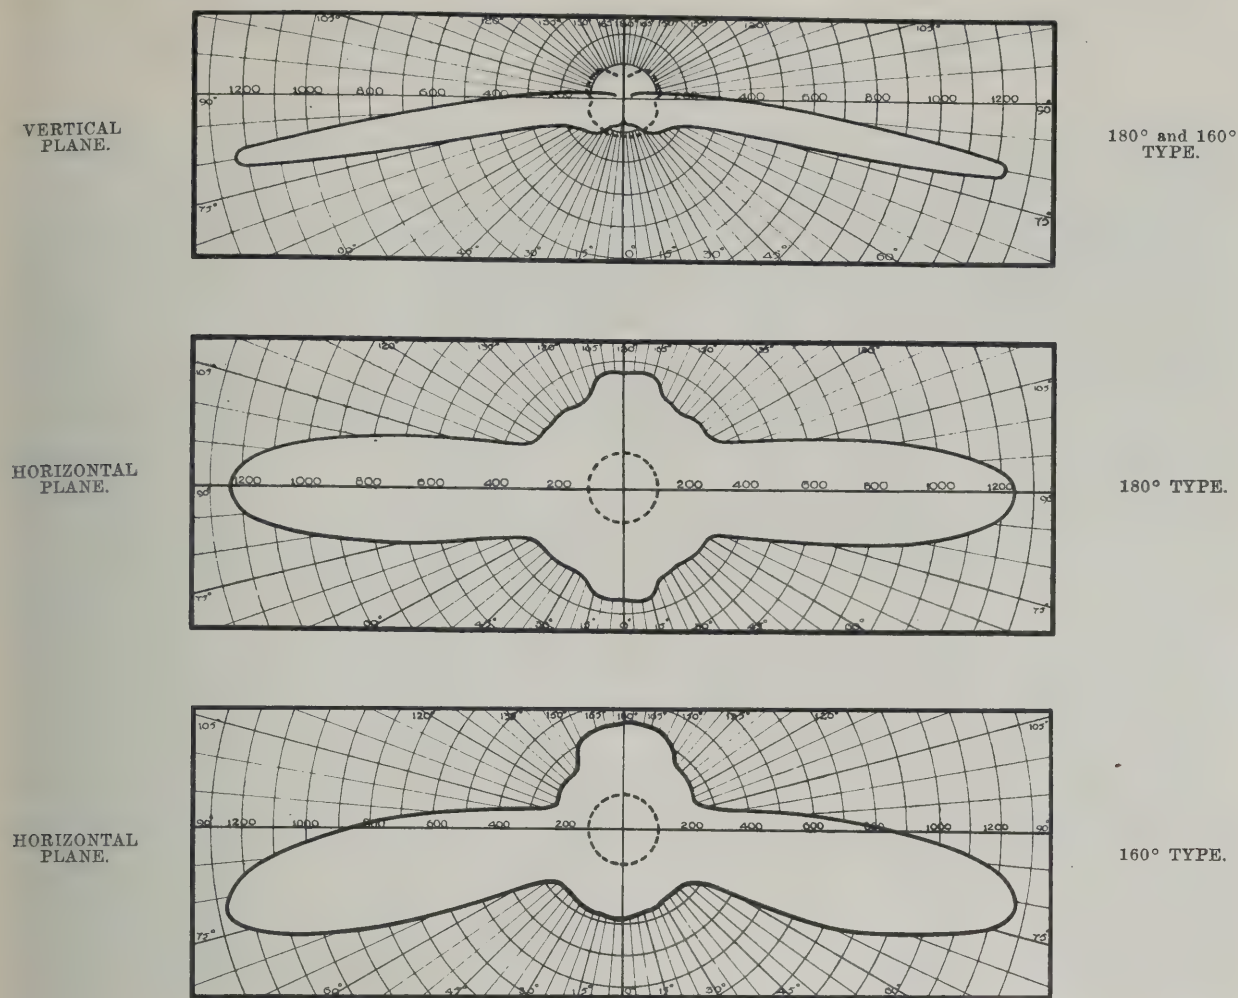

Fig. 48. LIGHT DISTRIBUTION CURVES FOR TWO-WAY REFRACTORS.

in directions immediately opposite at an angle of 180°, such as are usually employed in systems of central suspension; and those which project the light at 160°, as in the case of units mounted in line with the edge of the kerb. The action of these units will be seen from Fig. 48, where it will be observed how enormous is the improvement with such refractor units over the ordinary bare lamp distribution which is represented by the centre dotted line. The top curve shows the light distribution in the vertical plane, whilst the lower two give a plan view showing the projection of the main beams at an angle of 180° and 160° for the requirements of central or side mounting as previously explained.

Three-way refractor units are made for use at street intersections, giving the two directional beams at an angle of 160°, with a further beam in the centre to project up a side street, and four-way one for street crossings, both of which work on the same principle.

In regard to mounting heights, there is a gradual but nevertheless positive tendency towards greater mounting heights in street lighting. In garden villages and similar areas lighted by 100 watt units, mounting heights of less than 13 ft. should not be entertained. In more suburban areas served by 200 watt units, 15 to 16 ft. should be regarded as the minimum height for mounting. In business streets mounting heights of 25 and 30 ft. are becoming more general, using lamps between 300 and 750 watts, according to their relative importance. This increased height enables the use of greater spacing and the more normal projection of the light rays; it also considerably assists in reducing the glare factor.

For good practice in street lighting, the following approximate average intensities of illumination are desirable.

CLASSIFICATION OF STREET.	Average intensity of illumination (foot-candles).
Residential districts	0.05 to 0.10
Arterial streets, outside business districts, carrying much motor traffic and little pedestrian traffic	0.12 to 0.15
Business thoroughfares and roads carrying heavy motor traffic	0.20 to 0.30
Main business thoroughfares and promenade streets	0.40 to 0.50

As a guide in determining the size of lamps required to attain these lighting intensities, the following figures will be of assistance.

Lumens per unit required to produce 0.10 F.C. Average Illumination with modern Street Lighting Apparatus.				
TYPE OF DISTRIBUTION.	Mounting height from ground.			
	15 ft.	22½ ft.	25 ft.	30 ft.
	Generated lumens per unit per lineal foot of street.			
Symmetrical	20.6	24.0	26.0	28.0
Two and four-way	—	17.0	20.0	22.0

Illumination intensities, whether increased or decreased, should be approached gradually and not burst from one standard to another.

BUILDING CRAFTSMANSHIP—OLD AND NEW—II

Photographs by Nathaniel Lloyd, F.S.A.

THE TUMBLING STILE, CLOSED.

THE TUMBLING STILE, OPEN.

THE TUMBLING STILE WAS AT ONE TIME COMMON IN SUSSEX, BUT IS NOW RARELY SEEN. IT IS ONE OF THE SIMPLEST BUT CERTAINLY ONE OF THE MOST EFFICIENT OF ALL STILES.

THE CRAFT OF THE CARPENTER

Photographs by Nathaniel Lloyd, F.S.A.

THE STRUTS AND THE TREATMENT OF CILLS AND RAILS GIVES A SENSE OF SECURITY. THE WHOLE SHOWS A MASTERY OF TRADITIONAL DESIGN AND METHODS. Designed by SIR EDWIN LUTYENS.

THE RISING BRIDGE IS HINGED TO A BEAM ON THE GROUND, AND IS SO BALANCED THAT ONE MAN CAN EASILY RAISE IT BY PULLING ON THE CHAIN.

Obituary

Mr. E. Fiander Etchells

We regret to announce the death on January 5 of Mr. Ernest Fiander Etchells, Past President of the Concrete Institute, and of the Institution of Structural Engineers, and President of the Association of Architects, Surveyors and Technical Assistants. He received his technical education at the Whitworth Technical Institute and the College of Technology, Manchester, the Old Andersonian College, Glasgow, London University, and in the office of F. L. Lane, of Leeds. The early part of his professional career was spent on engineering works in South Africa, South America, the north of England and Scotland. Since 1902 he had been engaged under the London County Council in the administration of technical questions arising under the London Building Acts. Mr. Etchells, who was an Assoc. M. Inst. C.E., A. M. I. Mech. E., M. I. Struct. E., M. Math. Assoc., F. Inst. Physics and Membre de la Société des Ingénieurs Civils de France, had written numerous treatises and articles on mathematical and other problems of constructional work.

Sir Francis Fox

Sir Francis Fox, who died on January 7th, came of a well-known family of engineers, and was engaged on many important bridge-building and railway works, here and abroad, among them being the Grosvenor Road Bridge of the Southern Railway, the Great Central Railway Construction, the Great Northern and City, and the Hampstead and Highgate Tube lines, railways in Canada and South Africa, the bridge over the Zambesi at Victoria Falls, and he was nominated by the British Government as expert for the Swiss Federal Government on the boring of the Simplon Tunnel. In his later years he became particularly well known to the Architectural world as the foremost expert on underpinning and repairing historic structures, being engaged for the preservation works at Winchester, Canterbury and Lincoln Cathedrals, beside many churches and other public buildings. He also reported and advised on the repairs to St. Paul's Cathedral and Waterloo Bridge. Sir Francis, who was knighted in 1912, was the author of several books of engineering reminiscences.

Mr. Delissa Joseph

Mr. Delissa Joseph, F.R.I.B.A., who died on January 10 in his 69th year, was a well-known architect in the City of London, where he had practised for many years. His works include several blocks of flats, and two hotels in the west of London, factories in the south-east district, and many blocks of offices, banks and insurance offices in the City, also show-rooms and shops in Oxford Street, Tottenham Court Road, etc. He also designed the superstructures of many of the Central London Tube stations, and, as a member of the Jewish community, had been entrusted with the design of several synagogues in London and elsewhere. Mr. Joseph was a persistent advocate of higher buildings for London, and contributed to many newspaper controversies on the subject, as well as a paper in the journal of the R.I.B.A. He was, or had been, a member of various committees at the Institute.

Lady Weaver

The death of Lady Weaver, wife of Sir Lawrence Weaver, K.B.E., on January 10 will be very greatly regretted by their very numerous friends in architectural, art, literary and musical circles. Lady Weaver never wearied in doing good works, personally and unostentatiously, and not the least of them was her unremitting labour on behalf of the Ashstead Potters, that little band of disabled ex-service men in Surrey, in which both she and her husband were deeply interested.

Coming Events

The London Society.—Friday, January 14.—Mr. K. Rice-Oxley on "Hyde Park and Kensington Gardens." (Illustrated by Lantern Slides) 5 p.m.

Royal Drawing Society (Annual General Meeting).—Friday, January 14.—Dr. Bather on "The Significance of Shape." 4.30 p.m.

The Royal Institute of British Architects.—Monday, January 17.—General Meeting; Award of Prizes and Studentships: Criticism by Robert Atkinson on work submitted.

University of London.—Tuesday, January 18.—Dr. E. G. Richardson on "The Acoustics of Buildings." Further lectures will be given on January 25 and February 1. 5.30 p.m.

The London Society.—Wednesday, January 19.—Visit to the Coliseum and an inspection of the various parts of the building of interest. 11.15 a.m.

Birmingham Architectural Association.—Friday, January 21.—Sir Lawrence Weaver. (Subject to be announced.) Birmingham.

Edinburgh Architectural Association.—Monday, January 24.—Mr. W. Davidson, F.R.I.B.A., on "East Anglian Rural Churches and their Decoration." Edinburgh.

Royal Society of Arts (Cantor Lectures).—Monday, January 24.—Dr. L. C. Martin on "Recent Progress in Optics." John Street, Adelphi, W.C.2. 8 p.m.

"Birmingham Gazette" Brighter Homes Exhibition.—Birmingham, February 8-19.—Particulars from Provincial Exhibitions, Ltd., City Hall, Manchester.

The Second Edinburgh Housing and Building Exhibition will be held at Waverley Market, Edinburgh, from February 9 to 19, 1927. Plans and details from: Mr. T. Percy Bentley, Exhibition Offices, 7 Waverley Market, Edinburgh.

Manchester Building Trades' Exhibition.—March 29-April 9.—Particulars from Provincial Exhibitions, Ltd., City Hall, Manchester.

New West End Flats

A new block of flats is to arise in the near future on a site at the corner of New Cavendish Street and Hallam Street. On behalf of a client, Messrs. Yates & Yates (Hanover Square) have negotiated a building lease of the property known as 8a, 8, 10 and 12 New Cavendish Street, and 29-51 Hallam Street, covering an area of approximately 25,000 square feet. There are about 20 old houses here, and it is expected that operations for the clearance of the site will commence within the next three months. Plans are now in course of preparation for the construction of a block having two or three shops on the New Cavendish Street frontage and some ground floor consulting rooms, which should be readily lettable to the medical and dental professions. Above will be spacious suites of flats containing three reception rooms, five or six bedrooms, bathrooms, etc. Central heating, electric lifts, and all modern appliances and labour-saving devices are to be installed. It is anticipated that the building will be ready for occupation in the summer of 1928.

In a circular issued by the Ministry of Health to Housing Authorities on January 5, it is suggested that the selling price of houses erected by private enterprise, which receive the subsidy, should be reduced. As an example, it is suggested that where the maximum cost or freehold selling price, exclusive of subsidy, has been prescribed by the local authority as £600, it should be reduced to £550, making, where a subsidy of £75 is given, a total of £625. Where a lower limit of selling price is in force it should be reduced by an appropriate amount.

FRENCH PERIOD FURNITURE AND MODERN COPIES

Mr. Frederick Litchfield, last week, read an interesting paper on "French Furniture" to the Auctioneers' and Estate Agents' Institute. With a brief mention of delicate tracered Gothic furniture, his survey commenced with the Renaissance at the end of the 15th century and the beginning of the 16th century, in the reigns of Charles VIII and Francis I, and dealt principally with the fine flower of French furniture design under Louis XIV, Louis XV, Louis XVI, and Napoleon I. This included the furniture design by Le Brun and Berain with metal decorations by Boulle, tapestries by J. B. Oudré and Coypel, ormolu work by Cressent, Jacques Caffieri and Philippe Caffieri, cabinet work by J. F. Oeben and his pupil Riesener, painted decoration by Boucher and Laueret, metal mountings by Pierre Gouthière and Thornire, the last named being the great ormolu mounter in Napoleon's day.

The lecturer then passed to a consideration of the reproduction period of the great French styles in the last century, embracing the work of Zweiner, Beurdeley Dasson, Sormarie (for Vernis Martin work), Roux and Fourdinois, and concluded with some interesting experiences in the detection of reproduction work as under.

With the results of wear and tear and with what a French dealer once described to me as *patina de Londres*, by which of course he meant the action of our damp and foggy climate, some of these French reproductions made fifty years ago require very careful "vetting."

I will relate a personal experience which will show the minute examination which sometimes is necessary. A few years ago, I was consulted as to the genuineness of two important pieces of French furniture which formed part of a great collection, and upon which doubts had been expressed by two well-known experts. The one was a cabinet of Marie Antoinette period, the chief decorations being three beautiful panels of gold-ground lacquer, the gilt-bronze mounts being in the style of Gouthière, a charming example of the best French work of late 18th century. The other was a Marie Antoinette table, similar in design to the celebrated one, which in the Hamilton Palace sale realised £6,000.

I could find no fault with the cabinet—joinery, lacquer, or mounts—all these satisfied me and I expressed an opinion accordingly. My friend then extracted from the stand of the cabinet two screws of the kind known as "gimlet pointed," and asked me, was not the gimlet-pointed screw the invention of Joseph Chamberlain? I felt bound to agree, but I still felt certain about the cabinet, although the screws were extracted from portions of the woodwork where they could not have replaced others, and were evidently those used when the cabinet was made. I sent for a cabinet-maker foreman, who was many years ago in my employment, a very intelligent craftsman, and asked him to look at the cabinet strictly from a joinery point of view and tell me when he thought it was made. "French, late 18th century, sir, without any doubt," and he pointed out certain technicalities. I then showed him the gimlet-pointed screw, and asked if he could account for it. "Certainly I can, Mr. Chamberlain's patent was *not* for designing a gimlet-pointed screw, but for a machine to make them. These screws are some of the old *hand-filed* gimlet-pointed screws used for delicate cabinet work of the time." Now I must candidly admit that until that explanation I had not observed this difference. Under a powerful glass, I could see the differ-

I was in good company, with my want of observation, for the screw had been the cause of the unfavourable opinion expressed by two of our leading experts.

The Marie Antoinette table, I felt sure, was one of Henri Dasson's best reproductions, made some thirty-five years ago, and upon removal of some mounts I had the satisfaction of finding his initials.

This story shows how difficult it is sometimes to form a correct judgment, and at the same time how important. This cabinet was valued by me at £6,000 and the table at £300, whereas had I been satisfied that the latter was the same quality and period as the former, it would have been worth about £1,500 or £1,600.

There is a far cry from these first-class reproductions to those which are made by manufacturers of a lower grade. The construction of the furniture itself is not so skilful, the marqueterie is inferior, and the bronze mounts vary from medium to bad. The old process of gilding which in England is termed "water gilding," but in France *Dorée mercure* means the dissolving of pure gold in mercury applied to the highly chased metal when heated. The mercury evaporates, leaving a deposit of pure gold, which is not only very rich but also very lasting. Instead of this costly gilding a similar process to electro-plating, much cheaper and not so durable, is now generally adopted. The cheaper furniture will probably have the brass mounts lacquered, and not gilt.

Instead of the cast and finely chased mountings by such masters as Gouthière, it is possible to produce an excellent effect by electrotypes at less than a tenth the cost of elaborate chased work, and these productions of the galvanic battery require an experienced eye for their detection.

Another class of imitation is that made by the faker of old French furniture. In some cases, he has purchased very plain old pieces, such as one would find in old-fashioned hotels or middle-class houses, the general forms of which would be in accordance with their respective periods. He would then decorate the plain surfaces with marqueterie in the style he was copying and his brass mounts would be faked to have the appearance of age. An examination of the back of the cabinet or commode and the interior of the drawers would satisfy and deceive an inexperienced purchaser. I have seen chairs and sofas of this *bourgeois* class which have had chunks of wood *appliqué* to the old plain fronts of the frames, and these applications have been carved elaborately and sometimes very skilfully in the styles affected and then gilded. Here again an examination of the under parts of the chairs and the backs of the frames would convey an appearance of age.

It is proposed by the County Councils of Westmorland and Cumberland to remove the old Eamont Bridge, which connects the two counties, and to replace it with a new reinforced concrete bridge, 50 ft. wide, at a cost of about £40,000.

The foundation-stone of the English Bridge at Shrewsbury, which is being reconstructed, was laid last week. A plate, recording the present widening of the Bridge by 26½ feet, also a plate of 1769 found in the old foundations, and a complete set of 1926 coins, from the sovereign to the farthing, were built in the structure. The Bridge is expected to be completed this year.

London Building Notes

BETHNAL GREEN.—Additions, comprising casualty, receiving and isolation wards, are being built for the Bethnal Green B.G., at the hospital and institution in Cambridge Road, E.2. The builder, Mr. W. Simms, 137 Brook Street, Stepney, E.1, is working to the plans of Messrs. Meakin, Archer & Co., 73 King William Street, E.C.4.

BRAINTREE.—Work is in hand upon the erection of Braintree's New Town Hall which is to cost, when completed, about £50,000. The plans have been prepared by Messrs. E. Vincent Harris, F.R.I.B.A., and J. S. Courtauld, 29 St. James's Square, S.W.1. The builders are Messrs. Walter Lawrence & Son, Ltd., Finsbury Square, E.C.2.

CHADWELL HEATH.—It is proposed to build a picture house on a site on the Chadwell L.C.C. Housing Estate, to accommodate 1,200 to 1,500 persons. The plans, which also include a concrete hall and lounge, have been prepared by Mr. Edward Meredith, A.R.I.B.A., 35 Broomhill Road, Goodmayes, Essex.

CLAPHAM JUNCTION.—The Southern Railway are to build new cleaning sheds at Clapham Junction, S.W., which, together with the carriage sheds at Victoria, S.W., referred to in the *Architect and Building News* on December 13, will cost £160,000. The plans have been prepared by the Chief Engineer's Department at Waterloo Station, S.E.1, who will also supervise the construction.

COLINDALE.—The foundation stone has been laid by Air Marshall Sir Hugh Trenchard, of the new church of St. Alphage, which is to be built on the L.C.C. Housing Estate at Colindale. Erected chiefly in brick, at a cost of about £17,000, it has been designed by Messrs. Nicholas & Dixon-Spain, F.F.R.I.B.A., 19 Hanover Square, W.1, whilst the contract has been let to Messrs. Grace & Marsh, Ltd., New Bridge Works, Croydon. A contract for the vicarage, adjoining, has been placed with Mr. O. T. Hedges, Chalk Farm Road, Wembley.

CROYDON.—Designs have been completed by H.M. Office of Works at Storey's Gate, Westminster, S.W.1, for the erection of a new employment exchange at Croydon, to cost about £10,000 to £15,000. The work will be carried out by Messrs. C. H. Gibson, Ltd., builders, 124 George Street, Croydon.

DOLLIS HILL.—The Brentwater Estate at Dollis Hill, N.W., has been acquired by Messrs. Richard Costain & Sons, Ltd., builders, Blundellsands, Liverpool, who propose to develop it on town-planning lines. A lay-out has been prepared, and approved, showing sites for 1,394 houses.

DUKE STREET.—The site, formerly Nos. 3-5, in Duke Street, W.1, has been cleared of old buildings prior to the erection of a six storey block of business premises. Flats or offices will comprise the larger part of the accommodation, but on the ground level there will be two shops. Plans have been prepared by Messrs. Hoare & Wheeler, 22 Portman Street, W.1.

HAMMERSMITH.—A school of arts and crafts is proposed to be built by the L.C.C. at a cost of about £58,000. The plans, prepared by Mr. E. Topham Forrest, F.R.I.B.A., show two blocks of buildings—one for boys and one for girls.

HAMPSTEAD.—A block of shops with two floors of flats above is to be built on a site in Finchley Road, N.W. The plans have been prepared by Mr. W. S. Dakers, 110 Jermyn Street, S.W.1. The buildings will be erected by Mr. James Gibbs, builder, Temple Fortune Mansion, Hampstead, N.W.11.

HOMERTON.—A factory for the production of cardboard boxes, etc., is to be built on a site at Homerton, E.9, at the junction of High Street and Digby Road, for a local firm, Messrs. Matthews, Smith & Co. Plans have been completed by Messrs. Meakin, Archer & Co., architects, 73 King William Street, E.C.4.

KINGSLAND ROAD.—The Building Committee of the Metropolitan Hospital in Kingsland Road, E., have decided to erect additions, involving an expenditure of about £60,000. The new buildings, comprising a large nurses' hostel, have been prepared by Messrs. Young & Hall, 17 Southampton Street, Strand, W.C.

LAMBETH.—A start is to be made upon the site of the new variety theatre—the Brixton Hippodrome—at Brixton Hill, S.W. Including a large lounge hall and cafe, the building will provide accommodation for 2,500 persons. Plans have been prepared by Mr. J. Owen Bond, 20 Castle Meadow, Norwich, on the instructions of Mr. Adolph Neiman, of London, the promoter.

MORTLAKE.—Plans have been prepared for the development of the Cedars Estate, at Mortlake, S.W., involving extensive building operations. It is proposed to layout a system of new roads and to build on the frontages about 350 houses, 50 shops and flats, garages, bank, etc. The estate has been designed by Messrs. Blount & Williamson, 21 Buckingham Street, Strand, W.C.2.

NORTHOLT.—The Northolt Manor Estate, Ltd., 15 Henrietta Street, W.C.2, propose to develop on "garden city" lines, the Manor Estate, extending to about 130 acres. The scheme include the erection of 1,000 houses of various designs at a cost of £850,000, and the construction of roads at a cost of about £30,000. The plans have been prepared by the company's architects, Messrs. W. Louis Carr, 10 Roy Road, Northolt, and A. S. R. Ley, F.R.I.B.A., 214 Bishopsgate, E.C.3.

POWIS STREET.—Old property in Powis Street, S.E., has changed hands and rebuilding operations are imminent. The old buildings will be pulled down and plans proposed include a block of warehouse and office premises. The architect is Mr. C. Cowles Voysey, A.R.I.B.A., 14 Gray's Inn Square, W.C.1.

REGENT STREET.—Work is to be put in hand upon one of the few sites in Regent Street, S.W.1, which remain

to be developed under the proposals of H.M. Office of Woods and Forests. This concerns No. 16, for which plans for a large block of offices and shops have been prepared by Mr. J. J. Joass, F.R.I.B.A., 40 St. James's Place S.W.1. The proposed building is estimated to cost about £100,000.

RICHMOND.—New premises with shops on the ground floor, are to be built on a large site in King Street, Richmond. Plans have been prepared by Mr. Horace Field, F.R.I.B.A., 5 Gower Street, Bloomsbury, W.C., whilst the premises will be erected by Messrs. E. A. Roope & Co., Ltd., 7 Urswick Street, E.9.

ROMFORD.—Work is about to be started upon the rebuilding of the public house known as the White Hart in High Street, Romford, for Messrs. Ind, Coope & Co., brewers. The plans have been prepared by Messrs. R. Banks-Martin, Hammond & Co., architects, 199 Plashet Grove, E.6, whilst the contract has been placed with Mr. H. E. Jerram, Sandford Road, E.6. The cost of the alterations is about £9,000 to £10,000.

STREATHAM.—A new school is to be erected on the Streatham Vale Housing Estate, S.W., by the L.C.C. The building will cost with equipment about £24,300. The plans have been prepared by Mr. G. Topham Forrest, F.R.I.B.A.

THORNTON HEATH.—A bakery is to be added to the Central Stores in London Road, owned by the South Suburban Co-operative Society, Ltd. The building will be three storeys high and has been designed by Messrs. Bethell, Swannell & Drunford, 16a John Street, Adelphi, W.C. The contract has been placed with Messrs. Truett & Steel, Ltd., High Street Thornton Heath, S.E.

THROGMORTON STREET.—Alterations are being effected to premises in Throgmorton Street, E.C.2, in order to adapt them as an extension to the Ottoman Bank, adjoining the work. Of a structural nature, the work is all interior, and is being carried out by Messrs. Trollops & Colls, Ltd., 5 Coleman Street, E.C.2, to the designs of Messrs. Campbell Jones, Son & Smithers, 9 Dowgate Hill, Cannon Street, E.C.4.

VAUXHALL BRIDGE ROAD.—Operations are in progress upon the foundations for the first section of the large hotel, restaurant and office building to be erected at the corner of Vauxhall Bridge Road and Wilton Road, S.W.1, by Messrs. Watney, Coombe, Reid & Co., Ltd., brewers. The contract for the building has been placed with Messrs. Trollope & Colls, Ltd., 5 Colebridge Wharfe, Grosvenor Road, S.W.1, who are working under the direction of the brewery surveyors.

WOOLWICH.—Plans have been adopted by the governors of the British Hospital for Mothers and Babies, in Samuel Street, Woolwich, S.E.18, for the erection of a second wing at the hospital, to cost £100,000. The architects to the hospital are Messrs. Young & Hall, 17 Southampton Street, W.C.2.

The following abbreviations are used: U.D.C. for Urban District Council; T.C. for Town Council; R.D.C. for Rural District Council; E.C. for Education Committee; B.G. for Board of Guardians; P.C. for Parish Council; B.C. for Borough Council; M.H. for Ministry of Health; M.T. for Ministry of Transport; C.B. for County Borough; B.E. for Board of Education.

ABERCARN.—In addition to the housing schemes already in hand, the U.D.C. propose to erect about 60 working-class houses.

BODMIN.—The Housing Committee have under consideration the erection of 12 houses, in blocks of six, of the non-parlour type, the proposed site being in Burnard's Lane.

BOURNEMOUTH.—The T.C. are having plans prepared for the construction of baths on the Northwood Estate, off Charminster Road.

BUCKFASTLEIGH.—The U.D.C. are to apply to the M.H. for approval for the erection of about 20 houses of the non-parlour type on the Three Corners site. Plans have been approved of a proposed new east wing to Buckfastleigh Abbey.

CARDIFF.—Seventy-eight houses are to be erected at Ely by the City Council.

CHESTERFIELD.—In Derby Road a school-church is to be built, at a cost of £2,370.

CLITHEROE.—The surveyor has been instructed to proceed with the erection of smaller houses on the new section of the building estate, at Henthorn.

COBHAM.—The R.D.C. are to invite tenders for the erection of 15 pairs of houses on the Portsmouth Road.

CREWE.—The H.M. have sanctioned the borrowing by the T.C. of £11,904, for the erection of 24 houses on the West End Garden City site.

DAWLISH.—The M.H. has agreed to the purchase by the U.D.C., on the Luscombe Estate, of the site required for a housing scheme, and requested the council to send Mr. S. Churchward, architect, to London to discuss plans, which is being done.

DEWSBURY.—Messrs. James Austin & Sons (Dewsbury) Ltd., iron and steel merchants, have purchased Thornhill Forge Estate and intend to erect modern buildings.

DUBLIN.—Dublin is to have over 1,000 new houses in 1927. The City Commissioners have decided to put into effect two important housing schemes in the Drumcondra-Glasnevin and the Emmet Road areas. 534 houses will be erected in the former district and 500 in the latter.

DUNFERMLINE.—Plans were passed by Dunfermline Dean of Guild Court recently for the erection by David Beveridge, architect, Crossgates, of two semi-detached villas at Garvoekhill, Dunfermline.

EGHAM.—The M.H. have sanctioned the borrowing by the U.D.C. of £47,443 for the erection of 100 houses.

EPSOM.—The R.D.C. are to invite tenders for the erection of another 30 houses at Old Common.

FELTHAM.—Plans passed: 12 houses in Bedfont Lane, for Mr. How; and 2 houses in Camden Avenue for Mrs. E. Banks.

FELTHAM.—The U.D.C. have instructed the surveyor to prepare estimates for the construction of public lavatories at the cemetery.

FIFE.—The County Council recently agreed to a new housing scheme, involving an estimated expenditure of £158,400. They unanimously resolved to recommend the District Committee to erect the following additional houses within the district, with assistance under the Housing (Financial Provisions) Act, 1924: Auchterderran parish, 100 houses; Ballingry parish (Lochore), 50; Ballingry parish (Lumphinnans), 32; Kinglassie, 12; Kirkcaldy and Dysart parish (Thornton), 54; Markinch parish (Windygates), 48; Wemyss parish, 100.

FREMLEY.—The M.H. have sanctioned the borrowing by the U.D.C. of £24,000 in connection with the Watchett Housing scheme.

GLASGOW.—Large shop and showroom premises are to be built by Messrs. Boots Cash Chemists, of Nottingham, on the site at the corner of Argyle Street and Union Street, at a cost of about £50,000. The buildings are to be set back on a new frontage line in connection with a street improvement scheme, and have been designed by Messrs. Campbell & Harley architects, 18 Duke Street, Edinburgh.

GREENOCK.—Mr. A. C. Fletcher has acquired sites in Carmichael Street, west of South Street, and contemplates erecting 12 semi-detached dwellings, each of 5 rooms and kitchen.

GROSVENOR ROAD.—The new rink for the London Ice Club at Grosvenor Road was opened on January 14. A restaurant, tea lounge, American bar, and dressing and bath-rooms have been installed. The architect is Mr. S. Clough, A.R.C.A., L.R.I.B.A., and the contractors are Monolithic and General Constructions, Ltd.

HANLEY.—The Hanley Circuit has two building projects on hand. The building at Bold Street has been demolished for a new one on the same site to seat 350 and cost £2,750. At Abbey Hulton, a school-church, seated with chairs, at an estimated cost of £2,200, is proposed. Both buildings have been designed by Mr. H. Kelsall Armitage, of London.

HORNSEY.—The B.C. has advanced a sum of £107,932 under the Small Dwellings Acquisition and Housing Acts.

HULL.—Hull Savings Bank Committee is to erect branch premises in Southcoates Lane, Hull. The architect is Mr. J. Bilson, A.R.I.B.A., Parliament Street, Hull.

KEITH.—The T.C. has decided to build 16 more houses of a type and on a site to be decided later.

KINGSBRIDGE.—Mr. E. H. Ferris is to erect 17 houses on the Deer Park site.

LEEDS.—Amongst improvements contemplated by the Corporation are an enlargement of the central tramway depot at Swinegate, at an estimated

cost of £122,500, and a central hall on the Meanwood Estate.

LEEDS.—Mr. H. S. Chorley has prepared plans for the extensions of the tramway depot, Swinegate, Leeds, for the Leeds Corporation Tramways. The estimated cost of these extensions is £122,500.

LEIGH-ON-SEA.—A new school-church is to be built.

LIVERPOOL.—At a recent meeting of the Liverpool Housing Committee, contracts were passed for the construction of 1,250 new houses in the Walton and Fazakerley districts.

LIVERPOOL.—The acting director of Housing has been authorised to advertise for tenders for an additional 1,000 special non-parlour type houses, subject to the approval of the M.H.

LEWISHAM.—The B.C. have borrowed £91,000 to finance the first section of the building of their garden suburb at Grove Park, S.E.

MANCHESTER.—The E.C. proposes to acquire 10 acres of land at Chain Bar, Moston, as a site for the North Manchester Municipal High School for Boys. The proposal provides for the erection of a school containing 500 places, the estimated cost of erection being £60,000.

MIDDLESBROUGH.—The Governing Council of the Constantine Technical College, Middlesbrough, have decided to invite tenders for the erection of the college, which is estimated to cost £80,000.

MOLESEY.—The D.C. have been informed that the M.H. have confirmed the order which the council sought to purchase land at West Molesey for a housing scheme.

MONMOUTHSHIRE.—The County Sites and Buildings Committee intend to erect a mining centre at Abersychan at a cost of nearly £5,000.

NEATH.—Fifty parlour-type houses are to be erected on the north side of Brynhyfryd Road by the B.C.

NEWPORT (MON.).—The T.C. Finance and Housing Sub-Committee have applied to the B.H. for sanction to borrow £16,390, repayable within 20 years, for subsidy grants under the Housing Acts, 1923-25.

NOTTINGHAM.—Plans have been prepared by Mr. P. Morley Horder, F.R.I.B.A., 5 Arlington Street, St. James', S.W.1, for the erection of a large women's hostel at the new Nottingham University College. A site of about 3 acres has been allocated for the building, which will conform generally to the architecture of the university, and will cost about £30,000.

PLYMOUTH.—A proposal to extend the accommodation at Blackadon mental hospital at a cost of £261,000, is shortly to be discussed by Plymouth B.C.

PORHCRAWL.—It is proposed to extend and enlarge the Esplanade Hotel, which is owned by Messrs. R. E. Jones,

The Application of Craftsmanship

TO

RESIDENTIAL FLATS

IN the ordinary house, the maintenance of efficiency is more or less a matter of personal interest to the occupier, but in the case of blocks of flats no particular care is taken in the manipulation of the Switches—as long as they work.

The irresponsible attitude taken by many tenants should be countered as far as possible by the strength, durability and constant efficiency of the fitments themselves.

In the case of St. John's Wood Court here illustrated (probably the largest block of flats recently wired for electricity) CRABTREE SWITCHES WERE EMPLOYED THROUGHOUT.

Nottingham.

A SUGGESTION

MAY we suggest that before purchasing Fireplace Suites or Sanitary Appliances you and your Clients should visit our recently re-arranged Showrooms at 17 & 18 Upper Thames Street, London, E.C.4.

The range of Fireplace Suites offered for inspection is a very wide one. A special feature is the number of beautiful Period Designs, many of which we owe to our own craftsmen of a century ago.

The Register Grate illustrated is in Armour Bright finish and fitted with the Hot Hearth Fire. It is particularly suitable for office or country house use.

"O'BRIEN PHONE LONDON."

Ltd., High Street, Swansea. Sir C. Tamlin Ruthen, F.R.I.B.A., Bank Chambers, Heathfield, Swansea, is the architect.

RIPLEY.—The Guildford R.D.C. are to erect six houses at Ripley.

ROTHEWELL.—The U.D.C. is to acquire land at the Pastures for the erection of new open-air swimming baths.

SEATON.—The Southern Railway are to carry out extensive improvements and extension of the station, permanent way and sidings, at a cost of nearly £50,000.

SHEFFIELD.—A picture palace to accommodate 1,500 persons is to be built on the Manor Estate, Sheffield, at the corner of City, Ridgeway, and Prince of Wales, Roads.

SHEFFIELD.—An early start is to be made upon the building of the new cinema, the "Regent," on the site known as Barkers' Pool. There will be a café and lounge. The building will be of brick, on a steel framework, with a terra-cotta front, and has been designed by Mr. W. E. Trent, F.S.I., architect to the owners, The Provincial Cinematograph Theatres, Ltd., Regent Street, W.I.

SHENSTONE.—The B.E. have approved the revised plans for new premises for Little Aston Council School.

SHEPHERDS BUSH.—New film production studio and offices are being erected in Lime Grove for Messrs. Gaumont Co., Ltd. Mr. S. B. Pritlove, of 6 Sherwood Street, W., is the architect; Messrs. J. Jarvis & Sons, Ltd., the builders; and Messrs. Dorman Long & Co., Ltd., contractors for the steelwork.

SOUTHAMPTON.—The Southampton Co-operative Society is to erect a large emporium.

SOUTHPORT.—On behalf of the Southport Coliseum Co., Ltd., Mr. Geo. E. Tonge has prepared plans for a cinema on a site in Liverpool Road, Ainsdale, Southport.

STAFFORD.—The Staffordshire E.C. are to consider proposals for alterations at the Technical School.

STOCKINGFORD.—Nuneaton Council are to build 36 more council houses, of the 2 bedroom type, at Stockingford at a cost of £13,353.

STOKE-ON-TRENT.—The Sites Subcommittee have been instructed to inspect and report on sites, within or adjacent to the city, sufficient to accommodate approximately 2,000 houses, and steps are to be taken for the preparation of a building scheme.

STOURBRIDGE.—The B.E. have approved the plans for the erection of a new Secondary School at Stourbridge.

STRATFORD-ON-AVON.—The T.C. passed plans for 20 semi-bungalows in Loxley Lane and Manor Road, for Mr. E. Ellis; alterations to Royal Restaurant in Bridge Street, for Mr. H. G. Pearce.

THAMES DITTON.—The Kingston County Bench have approved plans for additions and alterations to the Swan Hotel, Thames Ditton.

THORNHILL.—A new church and Sunday-schools are to be built, at a cost of £6,000.

TRURO.—The R.D.C. have received sanction from the M.H. to the bor-

rowing of £22,000 for housing purposes.

TOTNES.—It was recently decided that the Council should submit a scheme to the Ministry for 32 houses: Marldon, 12; Ughborough, 2; Churston, 8; Dittisham, 4; Holmes, 4; Brent, 2.

TWICKENHAM.—The B.C. have approved plans, submitted by Sir Banister Fletcher, for the development of the Carpenters' Company Estate, which abutts upon Hampton, Wellesley, Spencer, and Walpole Roads. The scheme, which includes roads as well as tennis courts, provides for the erection of at least 151 houses, and comes under the Town Planning (General Interim Development) Order, 1922.

WALSALL.—Authority was given for the appropriation of part of Goscote Hall Farm as a site for the erection of a new Isolation Hospital.

WALSALL.—The T.C. propose to erect 8 parlour type and 12 non-parlour type houses on the Four Crosses site; 6 non-parlour houses in New Street and Marlborough Street; 8 parlour type houses in Beatrice Street; 6 parlour type houses in Forest Lane; and 17 non-parlour type houses on the Four Crosses site. These schemes involve an expenditure of £29,582.

WANDSWORTH.—The B.C. propose erecting 70 or 80 houses of the "A.X." type on the south side of Southeroft Road on the Furzedown Estate. The present contractor on the estate is to be invited to submit a tender for their erection.

WANSTEAD.—Preliminary work is in hand on the site of the proposed new Wanstead Telephone Exchange, the contract having been placed with Messrs. Marrable Bros., 60 Pretoria Road, Wanstead, E.11. A brick building of two floors with artificial stone dressings, has been designed by H.M. Office of Works, Storey's Gate, Westminster, S.W.1.

WARRINGTON.—It is proposed to erect on the Bewsey Estate 150 houses and an additional 100 houses on the Reynolds Street site. Application has also been made to the M.H. for sanction for 400 additional subsidy houses.

WEST BROMWICH.—Approval was given to the erection of a new picture house, subject to the work being commenced within three months. The building will seat 1,460 persons, and cost £40,000. A special feature of the premises will be the provision of crush halls.

WEST BROMWICH.—Sanction has been given to the erection of a new picture house, at £40,000, to accommodate over 1,400 people.

WEST HARTLEPOOL.—New schools are to be built at Hart Road, West Hartlepool.

WEST RIDING.—The West Riding E.C. recently approved an estimate of £53,940 for the provision of a Technical School and Boys' Secondary School at Brighouse. It was also decided to build a secondary school at Wath, at a cost of £41,050. The B.E. have notified the Committee that at present they can approve the erection of only a portion of the proposed new Mining and Technical Institute at

Whitwood, at a cost of £40,000, in place of the full scheme of outlay of £77,500, and it was decided to proceed with the smaller undertaking.

WHITCHURCH.—The U.D.C. have instructed the surveyor to prepare plans for a proposed new housing scheme. Sites at Rosemary Lane and Highgate were suggested.

WILLESDEN.—The Council has received notice from a firm of builders of its intention to erect 1,394 houses in the parish.

WIMBLEDON.—Plans passed by the T.C.: Mr. F. H. Skeens, 5 houses, Abbott Avenue; Messrs. W. H. Whitehead & Co., pair semi-detached villas and one villa, Richmond Road; Messrs. Whitehead, Bros., four lock-up shops, Alexandra Road; Messrs. Edw. Evans, alterations to back additions of 24 houses, (7 in Wilton Grove, 14 in Kingswood Road, and 3 in Mayfield Road); Mr. W. Fenn, lock-up garage and workshop in Pepys Road.

WIMBLEDON.—The T.C. have decided to erect swimming baths on land adjoining the site of the Latimer Road Baths, at a cost not exceeding £25,000.

WIMBLEDON.—The T.C. propose erecting an electricity sub-station on site in Cannon Close, and also the enlargement and re-equipment of three existing sub-stations, and the construction and equipment of 17 new transformer sub-stations within the area of supply, at an estimated total cost of £25,000.

WOKINGHAM.—The R.D.C. have decided not to grant subsidies in future for houses built solely for sale.

WOOLWICH.—The B.C. have received sanction from the L.C.C. for the borrowing of £10,278 for street improvements and £31,882 for the erection of 55 houses on the Eltham Housing Estate.

WOOLWICH.—The B.C. are to erect 55 houses on the Eltham Estate at a cost of £32,000.

WORCESTER.—The T.C. propose erecting public lavatories in Gheluwe Park, and urinals with an approach from the street, at a cost of £997.

WORCESTER.—The M.H. have approved the scheme of the C.C. to erect a smallpox hospital, and a suitable site is to be purchased.

WORCESTERSHIRE.—The C.C. is to obtain a site for the erection of a smallpox hospital.

YORK.—The E.C. have prepared a scheme for extensions at the Nunthorpe Secondary School. The Corporation Housing Committee have scheduled 450 houses in the city which should be put in a habitable condition and have certified nearly 700 which should be closed. Fields off Burton Lane are being acquired for a housing scheme. Plans passed: Boathouse Esplanade, for the Governors of St. Peter's School; warehouse, Walmgate for Messrs. H. Leatham & Sons, Ltd.

YORK.—Tenders are to be invited at York for the erection of 4 blocks of parlour-type houses with 3 bedrooms on the No. 1 Estate, York, for the C.C. on the Glen Estate (55 houses in pairs), and on the remainder of this estate houses in blocks of 6. The York C.C. are also to erect on the Campholton Road site 24 houses in pairs.

SOME TRADITIONS
OF THE
PLASTERERS' CRAFT

*Historical data and
matter by G. Bankart.*

MORTAR.

Plasticity, without excess of moisture, is a most desirable feature of mortar. To obtain this quality the ancients air-slaked their lime and kept it in covered pits for years; they then tempered and toughened the old lime by further ageing, and by repeatedly turning over and beating with flails as here shown.

PORTLAND CEMENT does not require such preparation but cement mortar should have a minimum of water, and at least twice as much sand as cement. Such a mixture is made wonderfully plastic, and is also permanently waterproof, when the cement has the addition of

YORK.—January 17.—For the erection of 42 scullery type brick houses on the Corporation Tang Hall Estate No. 2. F. W. Spurr, City Engineer, Guildhall, York. £2 2s.

The College of Estate Management

Mr. J. Leonard Crouch, barrister-at-law, recently delivered a special lecture at the College on "The Recent Developments in the Law and Practice of Surveys for Dilapidations." In the course of his lecture Mr. Crouch said that since the War statutory provisions had been enacted affecting the liability of landlords to repair certain classes of property. First in order of time came the Rent Restriction Acts. Under these a landlord, in certain circumstances, could not recover rent while repairs were required. The Housing Act of 1925, Section 1, provided that despite any stipulation to the contrary houses let at £40 a year in London and £26 elsewhere—the latter figure being an extension—were repairable by the landlord. The only test was rent. Section 2 provided that any house suitable for occupation by persons of the working classes were also so repairable. No rental limit was laid down, and the only test was suitability for the purpose named. On failure of the landlord to do the repairs the local authorities could do them. The cost became a mortgage on the premises. The Law of Property Act, 1925, by Section 147 enacted a new condition. If the landlord served an unreasonable notice to do decorative repairs, the lessee could apply for relief. It appeared that he could immediately commence proceedings. If this were so, it would appear advisable to write a letter before action, otherwise he might perhaps not get his costs, as the relief sought was discretionary: no question of damages arose. The section was apparently designed to meet abuses of the same description which Section 14 of the Conveyancing Act of 1881 effectively countered. The foregoing Acts followed the lead given by the many Agricultural Holdings Acts, and assisted the tenants who, from the circumstances of their cases, were considered by Parliament as not always capable of looking effectively after their own interests. Many decisions of the courts were reviewed. They mostly decided questions of mixed law and fact, and care would have to be taken to see that the facts of such precedents applied to other sets of facts, otherwise it might be found that the Courts distinguished the cases and did not consider themselves bound by their previous decision. In conclusion, Mr. Crouch said that when deciding what damages would be obtained for breaches of express or implied covenants, judges who sat without juries looked through the eyes of juries. Surveyors should do the same when advising clients. If both parties to a dispute endeavoured to do so agreement would usually eventuate and the expense involved in litigation would be avoided.

On January 18 Mr. Graham Mould, barrister-at-law, will deliver a special lecture on the effect of recent legislation on "The Law of Vendor and Purchaser"; and on January 25 on "The Law of Mortgages."

Medusa Waterproofing Compound

- ☪ Medusa Waterproofing Compound is permanent. It has been manufactured in the United States for over 25 years, and reports of the concrete jobs in which it was first used show they are giving excellent service to-day, the water repellent qualities of the concrete being still unimpaired.
- ☪ Ten years ago after careful test we took up its manufacture in Hull. It is employed as *a cure for dampness, in cellars, on exposed walls of houses and in similar work.* This is quite a common difficulty, and we can confidently recommend that if a rendering is applied, as described in our printed literature, the trouble will be permanently overcome.
- ☪ Such a rendering provides a material that is absolutely non-absorbent, and will not only withstand dampness but will *resist the highest water pressure* met with in ordinary practice.

Write for the Medusa Catalogue.

G. & T. EARLE (1925) LTD.
Hull

Building Tenders Accepted

BRADFORD.—New warehouses, sheds and offices are to be erected at Laisterdyke, Bradford, for Messrs. W. J. Whitehead & Co., the architects being Messrs. Ross & Briggs. The tender of Messrs. Phineas Drake & Son has been accepted.

BRADFORD.—The tender of Mr. J. Horkin has been accepted for the erection of new schools for St. Joseph's Roman Catholic Church, Liversedge. The architects are Messrs. Empsall, Clarkson & Clarke, Piccadilly, Bradford.

BRIGHTON.—New works are to be carried out at Portobello, a few miles east of Brighton, and at a recent meeting of the local Sewers Board the tender of Messrs. John Gill Ltd., of Westminster, for the reconstruction of the outfall sewer and the construction of a sea-wall and groyne at Portobello at a cost of £66,000 was accepted. It is stated that the new sea-wall will be about 300 yards in length, and will serve to protect the board's property from coast erosion.

EAST HAM.—For the erection of 12 single and 26 double-tenement houses, for the T.C. Messrs. Johns Bros., Albert Road, E.16, £37,989 14s. 9d.

EAVES.—The following tenders have been accepted for the erection of 14 houses in three blocks to be erected at Eaves for the Hebden Bridge U.D.C. Mr. H. L. Bottomley is the architect. Masons, H. Mortimer & Son, Hebden Bridge, O. Watson, Hebden Bridge; joiner, E. Johnson, Halifax; plumber, J. H. Boocock, Hebden Bridge; plasterer, E. Marshall, Halifax; slater, Pickles Bros., Leeds; painter, F. Round, Hebden Bridge; electricians, Harrison & Co., Halifax.

GLASGOW.—The Corporation have accepted the tender, £1,232 10s., of Messrs. A. & J. Scott for painting at the Municipal Buildings.

GLASGOW.—The Corporation have now accepted the tender, £12,030, of Messrs. Hugh Twaddle & Son, Glasgow, for plumbing work at Mearns-kirk Sanatorium.

GLASGOW.—The E.C. of the Corporation have accepted the tender, £245,060, of the Woodhall-Duckham Co., Ltd., for a new vertical retail installation for coke and coal handling plant at Dawsholm Gas Works.

HANLEY.—Stoke Corporation have accepted the tender, £750, of Messrs. H. Howlett & Sons, Hanley, for the erection of an electricity sub-station at Vale Place.

HULL.—The Corporation have accepted the tenders of Mr. F. Bilton for the erection of 282 non-parlour houses on the Winget system at prices ranging from £364 to £370 per house; and of Messrs. Kettlewell, Son & Co., Ltd., for 276 non-parlour houses on the Wild system at prices ranging from £370 to £378 each.

HULL.—The E.C. have accepted the tender, £11,322, of Messrs. Holliday & Barker for extensions at the Grammar School.

For the erection of an electricity sub-station on the north side of Hollywell Hill, the tender of Stokes Bros. has been accepted, at £187 10s.

THE TRUSCON FLOOR

IN REINFORCED CONCRETE

THE NEWCASTLE ELECTRIC SUPPLY COMPANY'S OFFICES, NEWCASTLE-ON-TYNE.

Associated Architects: L. J. Couves with Sir John Burnet & Partners. Contractors: Stephen Easten, Ltd.

TRUSCON FLOORS ARE BEING LAID THROUGHOUT.

THE LIVE LOAD ON AN OFFICE FLOOR IS USUALLY SMALL, THEREFORE THE DEAD WEIGHT OF THE FLOOR IS A VERY LARGE PERCENTAGE OF THE TOTAL LOAD TO BE CARRIED. THE TRUSCON FLOOR IS THE LIGHTEST FLOOR ON THE MARKET, AND ITS USE WILL EFFECT A CONSIDERABLE SAVING ON THE COST OF THE STRUCTURAL STEELWORK.

It is the primary duty of a floor to carry efficiently the loads which may come upon it. Of the other duties of a floor the least spectacular but the most useful is that of accommodating the "domestic services." The Truscon floor will do this.

Most buildings require gas and electric light, electric bells, telephones, and water supply. Heating systems, either radiator or "panel," have to be allowed for, and sprinklers or ventilating systems are often required. The Truscon floor has an accessible hollow space in which all these services can be effectually concealed.

THE TRUSSED CONCRETE STEEL CO., LTD.

REINFORCED CONCRETE ENGINEERS,

22 Cranley Gardens, South Kensington, S.W.7

Competition for Apprentices

The National Painters' and Decorators' Joint Education Committee of England and Wales has recently issued a pamphlet giving particulars of the annual prize competition for apprentices and craftsmen, to be held in October, 1927. The competitions are now open to all apprentices, journeymen and employers in England and Wales who come within the respective age classifications, provided that they are definitely engaged in or preparing to follow the craft. Forms of application can be obtained from the Secretary, National Joint Education Committee, 9 Albert Square, Manchester.

British Engineering Standards Association

The British Engineering Standards Association has just issued five new British standard specifications for red oxides of iron for paints, zinc oxide oil paste for paints, white lead and tinted white lead ready mixed paint and extra hard drying varnish. They contain clauses regulating the composition, together with standard reception tests, for the purchase of these materials, together with appendices giving methods of carrying out the tests. Copies of these five new specifications (Nos. 261, 262, 272, 273 and 274, 1926) can be obtained from the B.E.S.A. Publications Department, 28 Victoria Street, S.W.1, price 2s. 2d. each, post free.

Birmingham Power Station

The tender of International Combustion, Ltd., for the whole of the work involved in the construction of the first section of the new Hams Hall super power station (one of the new capital power stations under the Government's electricity scheme) has been accepted by the City of Birmingham Electricity Committee. This contract—which is the largest single contract of a comprehensive character yet placed in this country by any electrical undertaking—has an initial value of £1,458,000. International Combustion, Ltd., have also been appointed main contractors for the Perak hydro-electric power station, and will be responsible for all buildings, cranes, boilers and pulverised fuel equipment for the 12,000 K.W. station to be constructed in the Malay Peninsula. Messrs. Rendel, Palmer & Tritton, of Dartmouth Row, are the consulting engineers.

Building Costs

The Ministry of Health has sent a letter to the Tynemouth Corporation intimating that prices of building materials are being carefully watched, and that some time past an inter-departmental committee has been surveying prices where they appear unduly high owing to the operation of any trade combination or trust.

Trade Catalogues Received

Messrs. Bruntons, Musselburgh, Scotland. A small booklet giving the proper working load and the actual breaking strain guaranteed on each size and construction of rope. Copies can be had on application.

The National Gas Engine Co., Ltd., Ashton-under-Lyne, England. 20 pp. A fully illustrated catalogue of the National productions.

The British Thomson-Houston Co., Ltd., Mazda House, Oxford Street, London, W.1. 112 pp. A fully illustrated Price List (cancelling all previous issues) of the B.T.H. products.

R. A. Skelton & Co., Moorgate Station Chambers, London, E.C.2. 12 pp. A fully tabulated list of the various series of their broad flange beams.

W. Geipel & Co., St. Thomas' Street, London, S.E.1. 16 pp. A booklet published by the Okonite Co., U.S.A., for whom Messrs. Geipel are the sole agents, giving particulars of Okonite, Manson and Dundee tapes.

Bryce, White & Co., Ltd., Southampton. 76 pp. A brochure giving information regarding high-grade doors, gates, mouldings, chimney-pieces, etc.

Limmer and Trinidad Lake Asphalt Co., Ltd., 2, Ludgate Hill, Birmingham. A report of a survey carried out to determine the depth and quality of the asphalt, available in the Asphalt Lake in Trinidad, British West Indies, the production of which is one of the firm's chief assets in road-making.

"Beauty begins where the
light comes in"

Specify PLATE GLASS for Windows

You are then certain that the Glazing of the house will be in accordance with the rest of your architectural plan, in keeping with the degree of richness, dignity, beauty and desirability you have in mind.

Plate Glass, as the pre-eminent glazing, is being advertised to the public, who are learning to appreciate the value of Plate Glass for the windows of their houses.

Plate Glass is a non-conductor of heat, it is practically sound proof, and less liable to breakage. Its brilliant, polished surface enhances the exterior of a house, and from the interior it gives perfect vision. There are no ugly "wavy" lines or distortion; no detracting from the beauty that comes in — through the window.

"Plate Glass and the Home" is the title of a brochure being widely distributed among the public. A copy will be sent you free and post free on request. Write

Deal matching	36/-	43/-	53/-

Sashes, per foot super	1½ in.	2 in.
Deal moulded sashes, divided in squares	1/10	2/-

Windows, per foot super	Very small	Small	Normal	Large
Deal cased frames, 1-in. linings, 1½-in. pulley styles, 2-in. sashes in squares, oak sill, double hung with pulleys, lines and weights	11/-	5/-	3/6	3/-

Doors, per foot super	2	4	6
Square frame both sides doors	2/-	2/3	2/5
Add for each side moulded	2½d.	3½d.	4d.
Add for each side bead butt	4d.	4d.	4½d.
Doors of hardwood such as oak or mahogany, will cost three times as much exclusive of polishing.			

Staircase.			
1½-in. Deal tread, 1-in. riser, fixed complete per foot super			2/6
2-in. Deal strings, per foot super			2/-
Housing steps to strings, each			9d.

Satisfied

Client: Well, I must say I'm more than satisfied. I'm delighted. It's a fine, clean-looking job, and the flat roof is perfect. I congratulate you both.

Architect: Thanks very much.

Builder: Thanks also. But my part was easy. The idea is everything, and I worked from an excellent specification. That VULCANITE roofing is new to me, but I like the look of it, and the roofers who laid it were experts. I watched them with interest.

Architect: It's wonderful stuff altogether. Watertight and fire-resisting too. In this case it is covered with $\frac{1}{2}$ in. tar macadam, though sometimes I specify it to be covered with sand and gravel, which keeps the building beneath at an equable temperature, warm in the winter and cool in the summer.

Client: Well—it will need to be tough to stand up to its job as a recreation ground as well as a roof!

Architect: I'm not afraid of VULCANITE letting me down. It never has done, and I've advised it in a great many cases now. I'm always surprised that VULCANITE is so inexpensive. It is the best and least expensive material for flat roof covering.

"VULCANITE" roofing is used under the London Building Act and the Bye-laws, etc., of all Borough and Urban District Councils; and is accepted by all the leading Fire Insurance Companies as an Insurance Tariff Roof

We shall be pleased to have your request for our Illustrated Booklet, and to supply detailed drawings and estimates free.

VULCANITE FLAT ROOFING is supplied and fixed only by

Braithwaite Pressed Steel Tanks

to serve the latest form of transport

The Empire Air Route

INTERMEDIATE AIRSHIP
BASE, EGYPT.

Showing Braithwaite Tank used for
storing water with fuel oil tank in
background.

Write to Head Office for detailed
descriptive literature.

Standardisation of the component parts of the Braithwaite Tank enable the advantages of this form of construction to be applied with equal success to the storage of 5 tons of Fuel Oil or of 60,000 gallons of water. The material to build tanks holding 220 gallons and upwards is available from stock.

Erection is extremely simple requiring neither skilled labour nor special tackle, moreover these tanks are unbreakable and ship as dead weight.

BUILDING WAGE GRADES

Grade Classification	A	A1	A2	A3	B	B1	B2	B3	C	C1
Standard Rates	1/8	1/7½	1/7	1/6½	1/6	1/5½	1/5	1/4½	1/4	1/3½
Labourers' Rates	1/3¼	1/2½	1/2½	1/2	1/1½	1/1½	1/1	1/0½	1/0½	-/11½

The following are the gradings of towns in England and Wales. The rates quoted apply to all craftsmen, with the exception of those marked with an asterisk, which denotes that there is a differentiation in the rate paid to painters, details of which are given separately at foot. The London rates are:—Within a 12 mile radius from Charing Cross—all craftsmen (excluding painters), 1s. 9½d.; painters, 1s. 8½d.; labourers, 1s. 4½d. From 12 to 15 mile radius, all craftsmen (excluding painters), 1s. 9d.; painters, 1s. 8d.; labourers, 1s. 4d.

THIS IS AN ABRIDGED LIST; THE GRADINGS OF OTHER TOWNS MAY BE HAD ON APPLICATION TO THE EDITORIAL OFFICE OF THIS PAPER

THE DEFECTS OF PERFECTION

All modern workers in stained glass complain of the impossibility of getting the right kind of glass, says Mr. Bone, the London Editor of *Manchester Guardian* in commenting on a new window by Mr. Harry Clarke, which is to be erected in Notre Dame, Dowanhill, Glasgow. The old art of making glass in small quantities having been lost, the individual artist has to fall back upon the product of the commercial glass manufacturer, which in its purity and smoothness is altogether too perfect for its purpose, and although he may endeavour by etching or etching with acids to counteract these defects, the result contrasts unfavourably with the yellow quality of old glass, the very imperfections which provided useful bubbles and refractive surfaces. The comparison of old and new stained glass, to the detriment of the latter, is becoming fairly common; but it sets one thinking how often the architect and the artist find themselves, nowadays, in revolt against the very perfection of the material which modern industrialism places at their disposal. Years ago, for a noteworthy essay in colour architecture, a well-known London architect had to search the rejection dumps of the manufacturers for glazed bricks sufficiently imperfect and broken in tint to meet his ideas. For years, makers endeavoured to attain that evenness and perfection of tint which constituted their beau-ideal of a glazed brick or tile, only to find that the architect would have none of it. The art metal working firm could turn out wares with such absolute certainty of form and surface that the individual artist in metal began to achieve distinction by hammer-marking his work obtrusively. Whereupon, his commercial competitors copied his hammer-marks mechanically. The cement manufacturer in recent years has produced hard drying plasters of such perfection of surface that they have scared the architect back to the delights of "rough finish." The decorator, tiring of the fixed perfection of wall paper patterns, has gone back to paint, and escapes the certainty of tint in that material by the imposition of stipples and running glazes. The perfect exactitude which the machine gives to woodwork seldom pleases the artist; when he can, he forswears it for the labour

of the carpenter and joiner. The asbestos tile, intrinsically, is a very excellent roofing material; light, fire-resisting and easy to fasten securely; but its thinness, flatness and rigidity of colour made the architect an opponent. Manufacturers have since revised their ideas of colour, and in the form of corrugated sheets and pantiles the asbestos tile is claiming more and more of the architect's attention if not of his affection. The modelled plaster worker can achieve with moulds all the perfection of form which marks the work of the old stuccoist, but the architect, when money allows, prefers the more uncertain finger of the artist working *in situ*. Perfection of form, line and colour, it will be seen, have very different meanings for the artist and the manufacturer, although the latter, to give him his due, is seldom behindhand if a change in his methods will produce what he finds is wanted. The tile-maker, given a lead about "play of colour," now provides a bewildering choice through judicious tricks with his glazes and firing. Even the glass maker will produce antique blobs for the windows of the pseudo Tudor house. If the manufacturer often finds the artist a tiresome individual in his demands, he must remember that this revolt against perfection is by no means new. The builders of the Parthenon are believed to have curved their lines to satisfy the claims of defective vision; while, a few years ago, an American produced several learned books and articles to prove that inexactitudes in Gothic Cathedrals were "refinements," deliberately introduced to minister to the same human imperfection. If this be right, it is apparent, that perfection is one of those good things of which we, in an imperfect world, can have too much. We resent the too-perfect individual; we are loved more often for our faults than our virtues. It is then a rather human failing. The point in things architectural is when and where are we going to stop. We are asking the manufacturer to give us something less perfect than he set out to do; but if he achieves success in this direction, shall we then be satisfied. The "perfect" glass for the artist in stained glass will doubtless arrive; will he then still find perfection in its very imperfections.

Notes and Comments

Changing Paris

The formal opening, last Saturday, by the French President, of the long-deferred cut between the Boulevard Haussmann and the Boulevard Montmartre, thus completing Haussmann's great scheme of 60 years ago, comes at a time when the Paris of the Boulevardier has changed almost out of recognition. The old café life, which was such a feature of La Ville Lunniere, has practically disappeared, and the complacent contemplation of the passing pedestrian has now given place to a wholesome regard for the swiftly-moving motor car. Indeed, one architect friend, commenting on modern Paris, attributed these striking changes to the advent of motor transport, and it is significant that the opening of the new street immediately resulted in a great traffic block, motor omnibuses, taxicabs and pedestrians pouring along the new thoroughfare before the troops and dignitaries present at the opening ceremony could get away. In the matter of traffic congestion, the French capital, despite its fine straight arterial streets, does not seem in much better case than our own. The Committee there which is dealing with traffic problems, has turned down proposals both for sub-level roads and underground garages as possible means for relieving the congestion in the streets. The only solution that appears feasible is the gradual widening of certain streets. This will be enormously costly and probably ineffectual. With a constantly increasing motoring population, the wider the street the greater the traffic seems to be the rule. Probably, eventually, Paris and London will both have to deal as drastically with the private motor as the American authorities have done, banning it in the central areas of cities, and forcing owners to garage their cars some distance out and to complete their journey by rail or public conveyance.

Nottingham Statues

Nottingham has not been more blessed than other English cities in the street statuary it has acquired, but it seems to be more fortunate in effectively getting rid of it. The Clifton Statue which, in its faithful depiction of baggy trousers and other items of Victorian male habiliments, has many times been cited as the nation's worst public statue, has disappeared from the top of Queen's Walk; and the large marble statue of Samuel Morley, a local philanthropist and manufacturer of the same era, was, last week, dropped and smashed while being removed as an impediment to traffic in Theatre Square. As the contractors had insured the monument during removal, it is anticipated that it will be replaced; and one hopes that the authorities will see to it that the new work will be more creditable to their favoured and progressive city, as well as a more artistic tribute to the citizen it commemorates.

A New National Art Treasure

The Victoria and Albert Museum has just acquired from the Abbey of Heiligenkreuz in Austria a circular relief in the rare green porphyry quarried near Sparta, representing the Virgin in prayer, which is of the highest importance for the history of art. Apart from its great beauty, it is almost the only Byzantine carving in any material that can be dated with complete certainty; round the edge is an inscription in Greek invoking the help of the Mother of God for Nicephorus Botaniates, Emperor at Constantinople from 1078 to 1081 A.D. The relief, though comparatively few people can have seen it hitherto, is already known to students of Byzantine art, and has

more than once been described, but, as a rule, with inaccurate references and always with very inadequate reproductions. Nothing is known of its early history, but an engraving of it was published in 1666 by Chifflet when it was at Lyons in the collection of the famous antiquary Gaspard de Monconys, Seigneur de Liergues.

Preserving St. Pauls

We are informed that Canon Alexander's book on "The Preservation of St. Paul's" will be published almost immediately by Mr. John Murray at the price of 2s. 6d. net. As Treasurer of the Cathedral and Chairman of the Reparation Committee, Canon Alexander is the most fitting person to write authoritatively on the preservation work, which began in 1913. The book will contain a number of popular addresses on subjects connected with St. Paul's, as well as the official reports on which the work has been based. It will appeal, therefore, not only to technical readers like architects and engineers, but to the larger public which has a great affection for the building and has contributed to the preservation fund. The issue of this authoritative work may also have the beneficent effect of preventing or allaying those alarmist reports about the Cathedral which rather suggest that the experts in charge of it are not fully alive to the problems and dangers with which they have to contend.

New Flats in Old Houses

If Swakeleys, the fine old 17th-century mansion near Uxbridge, is pulled down, it will be proof of a great want of imagination on the part of the present generation, not merely in letting a fine building be destroyed, but in failing to see what an excellent proposition its preservation presents from a commercial point of view. Here is a house which, in a time of housing shortage and dear building, can be converted into twelve excellent flats at a total cost of £16,500, including purchase with 30 acres of beautiful old grounds. When quite small flats, as far out as Epsom, are advertised to let at £150 a year, it will be amazing if this scheme for flats in such an ideal situation, within 25 minutes by rail of Baker Street, does not tempt people to put up the necessary money. Apart from the house, which is in excellent repair, there are the stabling and outbuildings which would afford garage room for those tenants who have cars. The present owner purchased with the object of preserving the building, but cannot afford to retain the property, and the scheme now put forward is launched under the auspices of the National Trust and the Society for the Preservation of Ancient Buildings. The alternative, apparently, is the acceptance of an offer from a speculative builder who will pull down the house and cover the land with small houses of a kind, we are afraid, that has done much already to disfigure the western outskirts of London. Flats are badly wanted, especially by middle-class people, at rents that are not exorbitant, and the conversion of some of the large houses in and around London would at least provide flats with some reasonably good rooms. With the present cost of building, it seems impossible, judging by recent examples, to provide new blocks of flats that are much better than congeries of cupboards. It would seem, therefore, a sound policy to convert some of the large, unwanted houses into flats to meet the increasing demand for flats at reasonable rentals. The Swakeleys scheme of the two Societies seeks to establish a principle for utilising some of the fine old houses that are too large for present-day needs, and we wish it all success.

THE PASTURE HOUSE, NORTH LUFFENHAM.

C. F. A. VOYSEY, Architect.

C. F. ANNESLEY VOYSEY

I.—The Man and His Work

The first business of the portrait painter is to get his subject to sit, and the friend who, at the instigation of the Editor, has succeeded in subduing the extreme restiveness of Voysey at the approach of an interviewer can well sympathise with the painter's difficulties. Voysey's tenacity in avoiding capture was as obstinate in this as in some other matters his friends know of, and yielded finally to good nature on his part rather than to first-rate reasoning on mine. His final surrender was made in the following gracious words: "Why can't you wait till I'm dead?" and the question being promptly answered the position was won; but it still remained to decide how to set about the job. Here, Voysey gave useful hints. "Write about what you don't like. Criticise my work. Say how bad it is." And so the matter was settled in a satisfactory way, for it would be impossible to interpret Voysey by the unctuous note of veneration with which accounts of living architects in the technical press have made us familiar. As an entirely personal matter, I can say that in reading such columns I am frequently affected as though I were listening to some sea-sick person miserably retching eulogistic phrases which have already been evacuated. It is typical of such writings that they represent the men they signalise as riding on the crest of the architectural wave, or even on the frothing apex of its breakers. Voysey, however, is like a rock among those successive seas: inveterate in his likes and dislikes, unyielding to any fashions of thought or of sentiment, unmoved by changing vogues, a man whose artistic convictions are at one with his spiritual ideals and identified with his whole attitude to life and to work; he remains complete and sufficient, staunch and immovable. He changes not; men may come and men may go, wars and revolutions

along with them, but Voysey goes on for ever. This is well recognised by his friends, who find in him one of the most unaccommodating of mortals, who has long ago found clear answers to the questions that harass most of us throughout our lives, and who dwells in a compact impregnable system of his own. The inquirer may advance with wholly praiseworthy and amicable intentions upon the Voysey stronghold; the drawbridge goes down, the portcullis is raised, the castle is, by the owner's invitation, explored when, suddenly, the visitor receives a stunning blow and is flung headlong from the ramparts to meditate that however friendly his reception, his fortress is Voysey's undivided domicile and will give permanent shelter to no other human being whatever. These characteristics, it will be supposed, are the marks of a lonely man; but Voysey has probably more friends than acquaintances, and it is hard to imagine that he has one enemy in the whole world. I do not represent this last as in itself a merit, but as remarkable in one who is outspoken to the point of embarrassment and who is no respecter of conventions nor of the persons who stand for them; and because the explanation is due to a characteristic of the man, namely, that he can express himself strongly to everybody without roughness and without wounding anyone's feelings unless he so intends; and he never under any circumstances does so intend. If among his versatilities was included the power of being effectively articulate, his influence on current thought might be of the measure of the influence of his design on current architecture and the furnishings of buildings. "I cannot write," he says. This is not true, but the shyness—self-consciousness and lack of confidence—which all writers know is with him an inhibition, and his utterances have been rare. For this

reason, when he speaks, he is not readily understood; his voice is a new voice, his individuality a strange one: and thus, when he lately expressed himself in the public press, he was greeted with hoots by the modern cult, which neither reads the thoughts of others, nor thinks for itself, but bleats in unison with the flock that harbours it. With these to have courage and originality is to be a fool who does not know on which side his bread is buttered; to exhibit wit and a capacity for making luminous analogies is to confess levity and insincerity. Voysey suffers in the general fatuity induced by the Schools of Architecture, where to be trite and dull is a recommendation to minds which cannot be bothered to think or to feel, and which for the most part are bemused by the present-day impatience to gain money and by envy of those who by any means do so. Let it be remembered that Voysey, whether he agrees with all they have written or not, belongs to the school of thought of Ruskin, Morris, March Phillips, Lethaby and Penty, and it may be asked, is there any writer—excepting Geoffrey Scott—on an equal plane of capacity, literary skill, sensibility, or intellectual authority with these men and yet who is opposed to the ideas with which their names are associated? Small discernment is to be hoped from those who are unaware of the rout of their own prophet in the early chapters of "The Works of Man," and Voysey is not likely to be hospitably received by those who call upon laymen to elucidate for them the meaning of architecture; but the fact that Voysey is supported by the whole body of thought of all writers who, in this particular field, are of any serious account entitles his views to as much attention as the fruits of them, in liberating fancy and replacing conventions by ideas in domestic design and furnishings, have won from all architects who now tread those paths. Both in his principles and in his achievements Voysey exemplifies a living thought and a fundamental truth, and it is the purpose of this writing to display those matters.

C. F. A. Voysey is the eldest son of the late Rev. Charles Voysey, Vicar of Healaugh, near Tadcaster, Yorks; who was deprived of his living in 1869 because as his son expresses it, "he believed in a Good God instead of an Angry One." He was prosecuted for the heresy of denying the doctrine of an everlasting Hell, at the formal instigation of the Archbishop of York, who maintained an affectionate regard for the culprit throughout the proceedings, and afterwards. The prosecution was a *cause célèbre* of its day and the Vicar's defence—a matter of heavy cost—was supported among others by Stanley, Colenso, Hines, Ruskin, Tyndal, Huxley and Darwin, many of whom were, or afterwards became, his personal friends. It was the old fight, staged in mediæval form, of religion *versus* dogma; and, as usual, dogma ceremoniously claimed the victory and religion won the entire field and more than it ever sought or fought for. As he could not be burnt at the stake the Vicar of Healaugh founded the Theistic Church, and in Swallow Street, Piccadilly, was for forty years a leading preacher of the day, still well remembered, whose sermons were weekly printed and distributed to a very much larger congregation. It may interest some readers, as it does his son, to know that an ancestral grandmother of the Preacher was a sister of John Wesley; and that the tradition of Wesley's teaching has always been strong in the family and, as Voysey holds, inspired his father. That point must be of some significance when it is said that Voysey was throughout his boyhood an intimate companion of his father, and acknowledges a deep indebtedness to him. His sense of the matter is that he owes everything to his father; that all his beliefs and convictions are part and parcel of the fabric of his father's thought and teaching. This early entrenchment with a complete system of

ideals and precepts explains much of the obstinate firmness and tenacity of Voysey to the principles he stands for. What he was he is, and always will be. It need only be added that he was seven years old when he left Healaugh; was afterwards at Dulwich College for two years, and was then for eighteen months under the guidance of a private tutor. At the age of 17 he was articled to J. P. Seddon. This was in 1874. He was for five years a pupil in Seddon's office where churches, vicarages, and, in particular, Aberystwith University, occupied his attention. He seems to have made his capacities amenable to the discipline of authority in those days, for Seddon entrusted him alone with paint-pots in a Church; but the true Voysey expressed itself afterwards when his master left to him the design of a mural decoration in mosaics. My scrutiny of Voysey has been a searching one and I observed that this early exploit is a happy memory for the designer, not because it was his first executed design of the kind, but because two years after it was put up it was hurriedly pulled down by indignant authority which then for the first time discerned the true meaning of the symbolism employed in it, which represented Science tearing down Sacredotalism. The success of this early design is of no account, be it observed, to its author; its triumph for him is that it published to those who had eyes to see a denunciation of an opprobrious dogma the University espoused, and the glee with which Voysey recalls this exploit ignores the discomforture of the learned dons on finding the decoration they had bought and paid for had been grimacing at them behind their backs for two years. This is characteristic of Voysey. He pays dogma the unusual respect of being enraged by it, instead of laughing at it as he does at most other stupid things. If the Grand Praxis of the Kamtarist Church asked Voysey to design a carpet for the Sonoria of the Temple, depicting the Eternal Pink Porcupine diving to eternal bliss in the Sea of Grunk with a tralsk tied round its neck, Voysey would refuse. His conscience would not allow him to lend himself to perpetuating tenets which he abhorred. Thus he has never designed a Church; he would consider it flagrant hypocrisy in him to do so, unless he believed in the symbolism to be embodied in it.

After his five years' pupilage, Voysey remained as assistant in Seddon's office for a year, then filled a similar post for a short term in the office of Saxon Snell, and afterwards helped George Devey for two years during which time Devey took James Williams into partnership. At the end of these two years Voysey was sent down into Northamptonshire to direct the building of two cottages by direct labour, when not only the manner of construction, but the organisation of the works and the keeping of accounts, was in his charge. At the conclusion of that work and at the age of six and twenty he took an office in Broadway Chambers, Westminster, and set up in practice on his own account.

The Royal Canadian Academy

Mr. Henry Sproatt, LL.D., F.R.I.B.A., of Toronto, has just been elected president of the Royal Canadian Academy. He is the first architect who has occupied this position. The following architects have also been elected Academicians:—Hugh G. Jones, F.R.I.B.A., Montreal; Ernest Cormier (R.I.B.A., Henry Jarvis Student, 1914), Montreal; J. O. Marchand, Montreal; J. Melville Miller, Montreal; Hugh Vallance, Montreal; John M. Lyle, Toronto.

Mr. H. S. Gamley, R.S.A., Mr. W. C. H. King and Mr. Walter Marsden, M.C., have been elected Associates of the Royal Society of British Sculptors.

G.P.O. LETTER SORTING OFFICE, MOUNT PLEASANT, LONDON.
A. R. MYERS, A.R.I.B.A., Architect (H.M. Office of Works).

THE NEW G.P.O. LETTER SORTING OFFICE

This latest addition to the buildings occupied by the staff of the General Post Office accords well with the convention already established for this class of structure. It has been found necessary, of course, to build as high as the regulations of the London County Council permit, and the architectural problem set is one which designers of to-day are again and again faced with, namely, that of devising elevations of very large total dimensions without, on the one hand, violating the human scale by making the sub-divisions of the façade too great, or else wearying the spectator by an insignificant arrangement of repetitive elements. In this instance the architect has arrived at a compromise which is by no means unsuccessful. The very large apertures which lie between the fine tall pilasters on the main elevation have their scale broken in tripartite divisions, further reduced into small panes corresponding in size to those of the remaining windows of the façade which are of normal dimensions. By this means the latter are made to provide a welcome transition between the large expanses of glass in the main portion of the façade and the fenestration of the neighbouring buildings.

It is noteworthy that the pilasters, while serving the purpose of marking the corners of the building and establishing rhythmical sub-divisions in the façade, do not provide an instance of that "vertical emphasis" characteristic of what is sometimes described as the "modernist" style of architecture; for the windows are not grouped in long vertical

slits, but have the normal proportions which are determined by their association with the human figure. These pilasters are well designed, having a powerful group of crowning mouldings constituting true capitals, and are further surmounted by an elementary architrave and frieze and a very bold overhanging cornice, articulated immediately above the pilasters by pairs of large medallions. The grouping of the windows is highly satisfactory, the trinitarian arrangement of the main rows of large apertures constituting a true unity, while the group is further punctuated at its nether extremity by a substantial basement or plinth, which in an admirable manner takes within itself the sloping line of the ground, and prevents the latter from compromising the principal pattern of the façade. The adjacent wing is also well composed, in that the windows are here arranged in five rows, of which the topmost has a vertical dimension noticeably larger than that of the remainder, so forming an adequate termination to the vertical series of windows. On the ground floor storey the entrance doorway, with solid stone hood, seems to have just the right degree of architectural importance, while it is brought into aesthetic relationship with the main cornice by the addition of a pair of medallions which separate the hood from the architrave, and are of a design homogeneous with those above the pilasters.

Behind the main building we see another structure of comparable height with it, but designed in a more economical manner, without pilasters, and content with a far more insignificant cornice. The compara-

G.P.O. LETTER SORTING OFFICE, MOUNT PLEASANT, LONDON.
A. R. MYERS. A.R.I.B.A., Architect (H.M. Office of Works).

tive poverty of this design does not, however, offend us, because it is away from the principal street, and is thus quite suitably differentiated from the main façade of the new block. A word may be said with regard to the well-designed railings which separate the building from the pavement. As it is customary for a certain type of doctrinaire to decry the use of all railings which have not an obviously utilitarian purpose, one can all the more admire the courage of the architect in introducing this feature in his design, the justification of which obviously is that it prevents the tall plinth from too emphatically ignoring the human scale; for there is interposed between it and the pedestrian a transitional element of such a dimension that it keeps the scale of the pedestrian in countenance.

This is an example of official architecture, but the authorities of H.M. Office of Works have wisely allowed the name of the designer, Mr. A. R. Myers, A.R.I.B.A., to be published. This is a highly commendable course, for it makes it possible for the ability of the architect to receive the recognition it deserves. It remains to be said that the building is of re-inforced concrete construction, the re-inforcement designed by H.M. Office of Works. The basement will be utilised for stores and for staff accommodation, while the sorting of letters will take place on the ground and first floors, the second floor being occupied by administrative and clerical officers.

The general contractors were Messrs. Galbraith, Bros. & Co., Ltd., of Camberwell. The sub-contractors were: Maple wood block floors, Hollis Bros. & Co., Ltd.; steel casements, Williams & Williams, Ltd.; lantern lights, Hy. Hope & Sons, Ltd.; cast-iron railings, The Carron Co.; wrought-iron railings, Clarke, Hunt & Co., Ltd.; asphalt roads and roofs, The Neuchatel Asphalt Co.

The Architects' Registration Bill

In a recent communication The Royal Institute of British Architects state a Conference of Allied Societies of The Royal Institute of British Architects was held in London on January 17 to receive a report from the R.I.B.A. Registration Committee in regard to the Architects' Registration Bill, which is about to be introduced into the House of Commons. The meeting was attended by the President of the R.I.B.A. and by the Presidents and other delegates of the Allied Societies, the latter representing some 5,000 architects practising in Great Britain and Northern Ireland. The areas covered by these bodies include London and the Home Counties, Scotland, Wales and Northern Ireland, the counties of Berks, Bucks, Oxon, Warwick, Stafford, Shropshire, Hereford, Worcester, Devon, Cornwall, Hampshire, Isle of Wight, Yorkshire, Leicestershire, Rutland, Lancashire, Cheshire, Westmoreland, Norfolk, Northampton, Northumberland, Cumberland, Durham, Middlesbrough, Nottingham, Derby, Lincoln, Gloucester, Wiltshire, Somerset and Dorset. The secretary of the R.I.B.A. Registration Committee, Mr. C. McArthur Butler, presented a report showing that as a result of representations made in their corporate and personal capacity by the Councils and members of the R.I.B.A. and its Allied Societies within their respective constituencies, many responses had been received, and were still coming in, from Members of Parliament in support of the Bill for the Registration of Architects. Reference was also made to the wide publicity given to the proposals by the Press, which seemed generally to recognise that the matter was one of considerable public interest. The view was expressed that if fortunate in the ballot there was every probability of the Bill being passed by both Houses of Parliament during the coming session.

THE TWENTIETH CENTURY HOUSE

III.—The Æsthetics of Hygiene

By A. TRYSTAN EDWARDS.

In the last article of this series I ventured to introduce to the readers of this Journal an architectural feature which I described as "*the recess*." I do not claim for this that it is a complete novelty, because I have seen occasionally examples of a treatment resembling it in some particulars. I have seen in the design of blocks of flats vertical crevices in which staircases have been placed, and the walls of these staircases have been utilised for providing light and ventilation for some of the domestic offices, but I am not aware that the "*recess*" has previously been given architectural treatment or elevated to a position of honour or importance as being a necessary and even a characteristic feature of domestic architecture of the 20th century. And this is indeed the claim which I make on behalf of the "*recess*." It is one of the principal means of reconciling a high standard of sanitation and hygiene with a high standard of formal design. I am assuming that in the 20th century nothing less than the union of these two excellences will ultimately satisfy us.

As it takes more than one swallow to make a summer, it takes more than one example of the recess to establish the "*milieu*" in which this feature appears to be both natural and inevitable. We must see not only one recess but many examples of it before its true character and significance can be properly appraised. For having established the desirability of the recess as a means of disguising various pipes and other features associated with minor domestic offices, it remains to be considered how the recess can be designed in such a way that it achieves an harmonious relationship with the fenestration adjacent to it. It will be found that this is by no means an easy problem. Unless great care be taken in the first instance to design recesses having the architectural character which befits them there will arise a prejudice against these features, with the result that their beneficial effect upon domestic architecture will be altogether frustrated.

It is perhaps desirable at this point to intimate what will be the range of the illustrations devoted to this particular theme. Now houses or buildings may be divided roughly into two main types—the detached or semi-detached house or the house belonging to very small groups, such as we find in rural districts, in suburbs and occasionally in the built-up portions of our towns, and then the large formation either of terraces of self-contained houses or blocks of flats arranged in rows or quadrangular or other patterns. The recess will be found to be exceedingly useful in civilising the designs of the detached and suburban houses, which perhaps give the maximum offence at the present time on account of the crudity of their back and side elevations so prominently exposed to view.

Illustrations to the previous article showed a recess which was put to the maximum of sanitary work that was possible. The single cavity in the wall was made to conceal from public view no less than four waste pipes, besides a soil and ventilating pipe, and also served to accommodate a small window belonging to a food cupboard or larder. The plan depicted was that of a small flat in which it was possible to place the kitchen next to the bathroom, and so there was an unusual concentration of plumbing. I gave this example first in order to prove what the recess could accomplish "*at a push*." It is not often, however, that this feature would be required to serve so many purposes at once. Moreover, it is essential to its usefulness that it should be capable of accomplishing small tasks as well as great ones. I could easily produce plans for several hundred variations of recess illustrating the permutations and combinations in which half a dozen small elements of plan may be arranged. It will suffice for the present, however, if I give a few of the main types just to illustrate the degree of resource and flexibility of which this feature is capable. Each of the small plans given is, of course, but a fraction of a house or

Fig. 7.

Fig. 8.

Fig. 9.

Fig. 10.

flat, and the treatments shown and others like them can equally well be adapted for many different kinds of plan, whether of rural, suburban or of town house.

It must be admitted, of course, that the recess entails a certain additional expense. During the first few years of its adoption it will appear as somewhat of a luxury, but by degrees, as a result of its example, people will find it ever less and less agreeable to live in houses in which no effort has been made to civilise the façades in the manner which the use of the recess makes possible. I am not contending that various compromises cannot occasionally be devised by which the smaller domestic offices can be given an urbane exterior without the use of a recess, and I shall mention some of these alternative methods later, but it is likely to be established nevertheless that this particular feature whose characteristics I am now expounding will be required to bear the brunt of the battle on behalf of the "aesthetics of hygiene." After having been at first a luxury, it will tend to become a necessity.

It stands to reason, of course, that the fewer recesses which are required to accommodate the small windows and external pipes appertaining to bathrooms and closets the more economical does the recess become, and the architect will naturally strive to make each recess do as much work as possible. It must be remembered, however, that a single vertical group of very small windows near each of which there emerges from the wall, at an oblique angle, an obtrusive pipe which joins itself to a vertical pipe which perhaps soars above the roof line in the form of a ventilator, does almost as much damage to the appearance of the façade as does a concentration of several such monstrosities. Let us begin, therefore, by considering what can be done with the single water closet for which it so happens that room can only be found in between two bedrooms or other rooms of ordinary dimensions. Fig. 5a shows a possible treatment in which the column of closet windows is recessed about a foot behind the main wall surface, and the soil and ventilating pipes screened from public view. The solution, however, is scarcely satisfactory, because the recess is too narrow to admit of effective

architectural treatment. It is understood, of course, that the recess does not take the form of a long slit from top to bottom of the façade, but is bridged over at intervals, roughly corresponding to the horizontal bands of wallage separating the rows of windows on the main façade. In spite of this, however, the narrowness of the aperture will probably cause a violation of the scale determined by the rest of the windows. It is nearly always desirable, therefore, to broaden the recess to at least six feet, and there can generally be found a quite legitimate excuse for doing this. Fig. 5b shows a case in point where room has been found for a short passage alongside the closet which serves the very useful purpose of providing its entrance with cross ventilation. Fig. 6 shows a recess accommodating two closets, which is also a quite feasible arrangement, having the same external effect as in Example 5b, except that in this instance the soil and ventilating pipe would require to bisect the double window, unless, of course, two such pipes were provided, which might be considered an unjustifiable extravagance. Even here, however, the recess is worth while, inasmuch as it effectively removes these pipes from the main façade. From the hygienic point of view, an improvement on Fig. 6 would be effected if a short corridor were provided between the closets, giving cross ventilation, as in 5b. If only one closet shows itself upon the façade in a particular place, and it is desired, nevertheless, for the sake of the architectural composition as a whole, to give the recess a certain quality of amplitude and scale, it is always possible to incorporate into it parts of the rooms on either side of the closet, so that we have an architectural result similar to that shown in Fig. 7, where it is obvious that the closet, while perhaps it may be regarded as a somewhat inadequate occasion for such a formidable architectural effort, has itself been formally obliterated in the process. Fig. 7 illustrates three other rather important points. It shows how a recess may, although quite lightly worked on one floor, may yet be adapted for accommodating a greater number of domestic offices on other floors. In this instance there is nothing to prevent the floor above showing not only a closet,

Fig. 11.

Fig. 12.

but two bathrooms as well, conveniently grouped around the same recess. Next the design illustrates a formal variation from the plans hitherto shown, inasmuch as it has been found desirable to project the front wall of the recess, so that the latter does not have the appearance of a dent in the main façade, for while there is indeed a cavity in the latter, we are compensated for this by the fact that this cavity is associated with a part of the façade which is advanced in front of the main line. The design, however, has a certain blemish, inasmuch as the back wall of the recess is in the same identical plane as the main façade, which indicates that the latter has not been inflected to prepare itself for the projection. In Fig. 8 this defect has been remedied, for here we see that instead of there being only two vertical planes there are three, and the back wall of the recess is suitably differentiated from the main façade, and thus the projecting members on either side of it are given a reason for their existence. Fig. 8 shows how the single closet can be associated with an even broader recess than in Fig. 7. In both these examples it will be observed that the projections on either side of the cavity have been made use of for the provision of shelves.

By far the most common use of the recess would be for accommodating both closet and bathroom, and Figs. 9, 10, and 11 show examples of this combination. Fig. 9 seems the most straightforward solution of the problem, indicating, as is proper, a cross ventilating corridor in the centre. Of course, it can easily be imagined that an even more economical recess could be contrived without the corridor, and the reader can himself picture alternative recesses in which could be arranged two bathrooms, two bathrooms and one closet, or even two bathrooms and two closets. In the case of Example 9 it is obvious that where the recess presents such a wide expanse of window space the adjacent rooms could not with propriety have windows very close to it. Fig. 10 shows how, by a variation in the form of the recess, the window on the right hand side could be brought nearer to the bathroom wall, as would be necessary were the dimensions of the room as shown in this example. This result is achieved by placing only half the external wall of the bathroom in the recess. Another method of bringing the window of one of the adjacent rooms nearer close up to the wall which separates it from the closet, is illustrated in Fig. 11, in which the closet window is placed at the side of the recess, thus enabling a blank wall to be shown at its narrow end. It is clear that in this instance the recess can be put to still further use, because, if necessary, the side opposite the closet could contain another small window, or as a screen for pipes emerging from an additional bath, wash-basin, or sink, assuming that the room were used in this latter instance as a kitchen.

The preceding diagrams will perhaps make it clear that the recess can be accommodated to many types of plan and elevation. Externally, the recess may be divided into three main kinds, shallow, as in Figs. 5, 6, 9 and 10; deep, as in Fig. 11; and with projecting frontage, as in Figs. 7 and 8.

The next step in the argument is to discuss the appropriate use of these several types and the method of harmonising them with the fenestration of the ordinary kind.

The last example, Fig. 12, shows yet another variation, where a deep recess with projected frontage provides for not only a closet and bathroom opening from a corridor, but a second bath and wash-basin placed in a dressing-room adjoining the principal bedroom. In this instance it would be possible to arrange on the ground floor a front entrance through the recess to a hall, having a cloakroom conveniently placed.

Coming Events

A.A.S. and T.A.—Saturday, January 22.—(Midland Division.) Visit to Repertory Theatre, Birmingham. (Metropolitan Division.) Visit to Woolwich War Memorial Hospital.

Royal Society of Arts (Cantor Lectures).—Monday, January 24.—Dr. L. C. Martin on "Recent Progress in Optics." John Street, Adelphi, W.C.2. 8 p.m.

Edinburgh Architectural Association.—Monday, January 24.—Mr. W. Davidson, F.R.I.B.A., on "East Anglian Rural Churches and their Decoration." Edinburgh.

The Architectural Association.—The General Meeting arranged to be held on Monday next has been unavoidably postponed until a date to be fixed later.

University of London.—Tuesday, January 25.—Dr. E. G. Richardson on "Acoustics of Buildings." 5.30 p.m.

College of Estate Management.—Tuesday, January 25.—Mr. Graham Mould, barrister-at-law, on "The Law of Mortgages." 5.30 p.m.

The Gloucestershire Architectural Association.—Tuesday, January 25.—Dinner, to be followed by a discussion on "New Materials and Methods of Construction."

The Liverpool Architectural Society (Inc.).—Wednesday, January 26.—Informal Talk on "Competitions." Mr. Percy Thomas, F.R.I.B.A. (Illustrated by drawings and preliminary sketches.)

Royal Institution of Great Britain.—Thursday, January 27.—Mr. J. R. H. Weaver, M.A., on "Romanesque and Early Pointed Architecture in Spain." 5.15 p.m.

Hampshire Architectural Association.—Friday, January 28.—Council Meeting.

Institution of Municipal and County Engineers.—Saturday, January 29.—South Midland District Meeting, to be held at Dunstable.

"Birmingham Gazette" Brighter Homes Exhibition.—Birmingham, February 8-19.—Particulars from Provincial Exhibitions, Ltd., City Hall, Manchester.

The Second Edinburgh Housing and Building Exhibition will be held at Waverley Market, Edinburgh, from February 9 to 19, 1927. Plans and details from: Mr. T. Percy Bentley, Exhibition Offices, 7 Waverley Market, Edinburgh.

Manchester Building Trades' Exhibition.—March 29-April 9.—Particulars from Provincial Exhibitions, Ltd., City Hall, Manchester.

Regent's Park Flats

In the planning of the block of flats which in due course is to occupy the site of Abbey Lodge, Hanover Gate, Regent's Park, no provision is being made for fireplaces or flues. Consequently the building will be without chimneys, and the flats are to be run entirely by electricity. The absence of chimney-stacks will enable a flat roof of considerable extent to be constructed, and on this it is intended to have tennis and squash racquet courts, golf practice nets, a children's playground, and other facilities for outdoor recreation.

Professional Notes

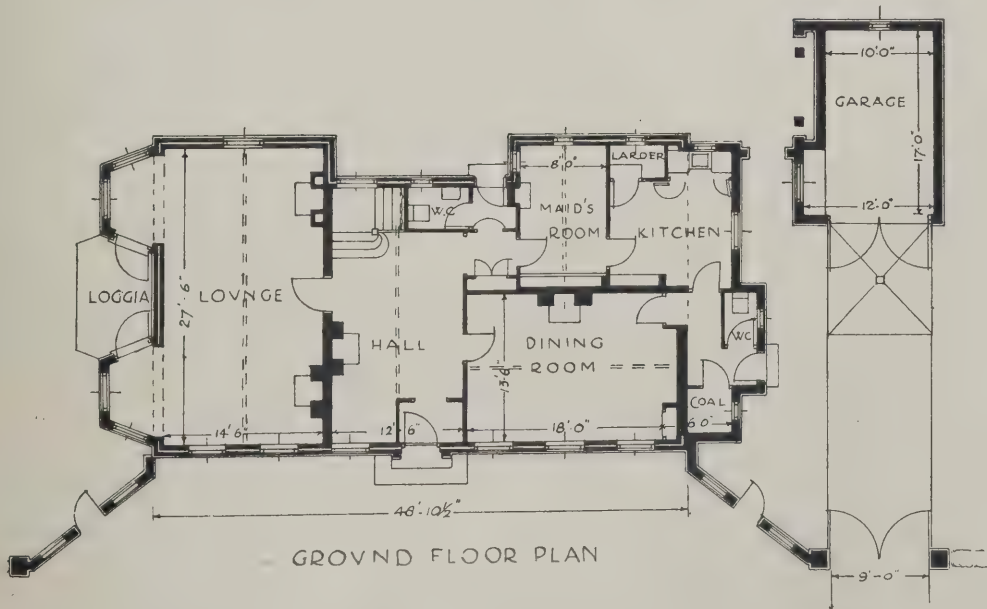

Mr. Cyril A. Farey, A.R.I.B.A., has moved from his old offices and is now practising at 7 Bedford Square, W.C.1. Telephone: Museum 2420.

Mr. Joseph Emberton, A.R.I.B.A., has changed his address to Chesham House, 150 Regent Street, W.1. Telephone: Gerrard 9611.

The engagement is announced of Mr. Alfred Stocken Knott, A.R.I.B.A., and Miss Edna Mosely, A.R.I.B.A.

FIRST FLOOR PLAN

HOUSE AT PURLEY, SURREY. W. BRAXTON SINCLAIR, F.R.I.B.A., Architect.

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS

Award of Prizes and Studentships

The annual award of Prizes and Studentships for the current year was announced at a meeting of the Institute held last Monday, Mr. E. Guy Dawber, President, presiding. After the preliminary business of the meeting, Mr. Robert Atkinson read his review of the works submitted.

In the course of his remarks Mr. Atkinson said the Institute was very gratified at the response of the students in the competitions for the year under review. Some time back it appeared as if the competitions would peter out, but they had now been brought up to date and the programmes co-ordinated. The general level reached was of a high standard, although no work was submitted of great outstanding ability. The students' work was divided into groups: craftsmanship, construction and competitions for design—the great test of an architect. The Measured Drawings were well up to standard and the three studies submitted equally worthy of the prize: the set which secured the award was extraordinarily good.

Speaking of the Grissell Award (for the Encouragement of the Study of Construction), Mr. Atkinson said construction could not be successful unless founded on experience. The competition for the award was disappointing: only three competitors and two commonplace, but the winner was well worthy of the award.

The Henry Saxon Snell Prize, said Mr. Atkinson, was also a competition in experience, and in this case for hospital work. The winner had a good plan and aspect, and in spite of the difficulties his was the best of the schemes submitted. The elevations were well treated and went a long way towards the winning of the prize: it was simple and dignified and not of the Institution type.

The Owen Jones Studentship (for Ornamental and Coloured Decoration), continued Mr. Atkinson, was a little disappointing—only eight competitors: it was a disappointment of quantity, however, and not quality. Decoration was most important to architects, and he would suggest that colour and decoration needed progressive education: there were very few architect decorators by birth. A lot of decoration could be done without the painter or sculptor—the architect could instruct his craftsmen and produce colour schemes both beautiful and satisfactory. It was difficult to see why the architect did not develop this side of his practice; yet when it came to the solution of colour schemes they were often spoiled by outside influence. The work of the Owen Jones winner was satisfactory and altogether a great effort, but in future they would like to see 20 or 30 competitors.

Reiterating the necessity for design, Mr. Atkinson said design was the accumulation of an architect's training: the finest brain was valueless without procedure and order. An architect should marshal his impressions and facts into groups: this marshalling of facts was the great art of design. They must be marshalled and put down in such a way as to be readily understood. None of the designs in the Victory Scholarship pleased him in the least. None of the students appeared to have read up the L.C.C. Regulations as to places of amusement; in not a single case had the rules as to seating been obeyed; none would have been approved by the L.C.C.

The Tite Prize represented a similar problem. The subject set was for "A Belvedere"—somewhat on the lines of Versailles. With the exception of two, all the plans submitted were of the same type: not inspired and with little interest about them. The buildings had too many vestibules.

With regard to the Essay Prize, Mr. Atkinson said it had not been awarded, and in this respect he must say he disagreed with the jury. He had read the Essay and considered it extraordinarily good—far above many which had previously been awarded the prize.

In conclusion, Mr. Atkinson said the drawings submitted were well above the average, and his criticism had taken the form it had because he considered criticism must be of a constructive nature. It had struck him that not enough attention had been paid to studying the plan. It was essential they should analyse the facts, put them together properly, and dissect them themselves. They should be able to take the programme apart and put it together in another way—in no competition was it more important than in the Victory Scholarship.

Mr. Maurice Webb, in proposing the vote of thanks, said he did not agree with some of the things Mr. Atkinson had said. It seemed to him that he had been a little hard on some of the students. Some of the programmes were very difficult and could not possibly have been grasped by the students.

After Mr. Stanley Hamp had seconded the vote of thanks, Mr. Guy Dauber said he disagreed with Mr. Maurice Webb; he thought the criticism of Mr. Atkinson, although, as they might expect, dry, caustic, pawky and Scotch, yet of a kindly nature and of such a form as they would expect from one who had been through the mill.

Mr. Robert Atkinson briefly responded.

Prizes and Studentships

The following is the list of successful competitors in the various competitions:—

THE TITE PRIZE AND £50 FOR DESIGN.

Awarded to Mr. Eric B. Cumine (Architectural Association), London. Certificates of hon. mention were awarded to Mr. E. B. O'Rorke (Architectural Association), London, and Mr. Donald H. McMorran, 34 Butler Avenue, Harrow-on-the-Hill.

THE VICTORY SCHOLARSHIP AND £150 FOR DESIGN.

Awarded to Mr. H. T. Dyer, 30 Bernard Street, Russell Square, W.C.1. Certificates of hon. mention were awarded to Miss Joanna Macfadyen (Architectural Association), 9 Bury Street, Chelsea, S.W.; Mr. D. H. Beaty-Pownall (Architectural Association), Weyside Lodge, Thames Street, Weybridge; and Mr. R. P. Cummings (Architectural Association), 73 Boundary Road, St. John's Wood, N.W.8.

THE R.I.B.A. SILVER MEDAL FOR MEASURED DRAWINGS AND £75.

Awarded to Mr. B. S. Tempest, 56 Station Road, Harrow-on-the-Hill. Certificates of hon. mention were awarded to Mr. R. O. Vine, 7 Whymark Avenue, Wood Green, N.22, and Mr. Daniel Roth, 64 Antill Road, Bow, E.3.

THE PUGIN STUDENTSHIP. A SILVER MEDAL AND £75.

Awarded to Mr. T. M. Ashford (Dublin School of Architecture and the Architectural Association, London), 30 Fountain Road, Edgbaston, Birmingham. A certificate of hon. mention was awarded to Mr. Sydney W. J. Smith, "Kenilworth," 40 Ashbourne Grove, E. Dulwich, S.E.22.

THE OWEN JONES TRAVELLING STUDENTSHIP AND £100.

Awarded to Miss Ruth Ellis (Architectural Association), 44, Clarendon Road, Holland Park, W.

Continued on page 150.

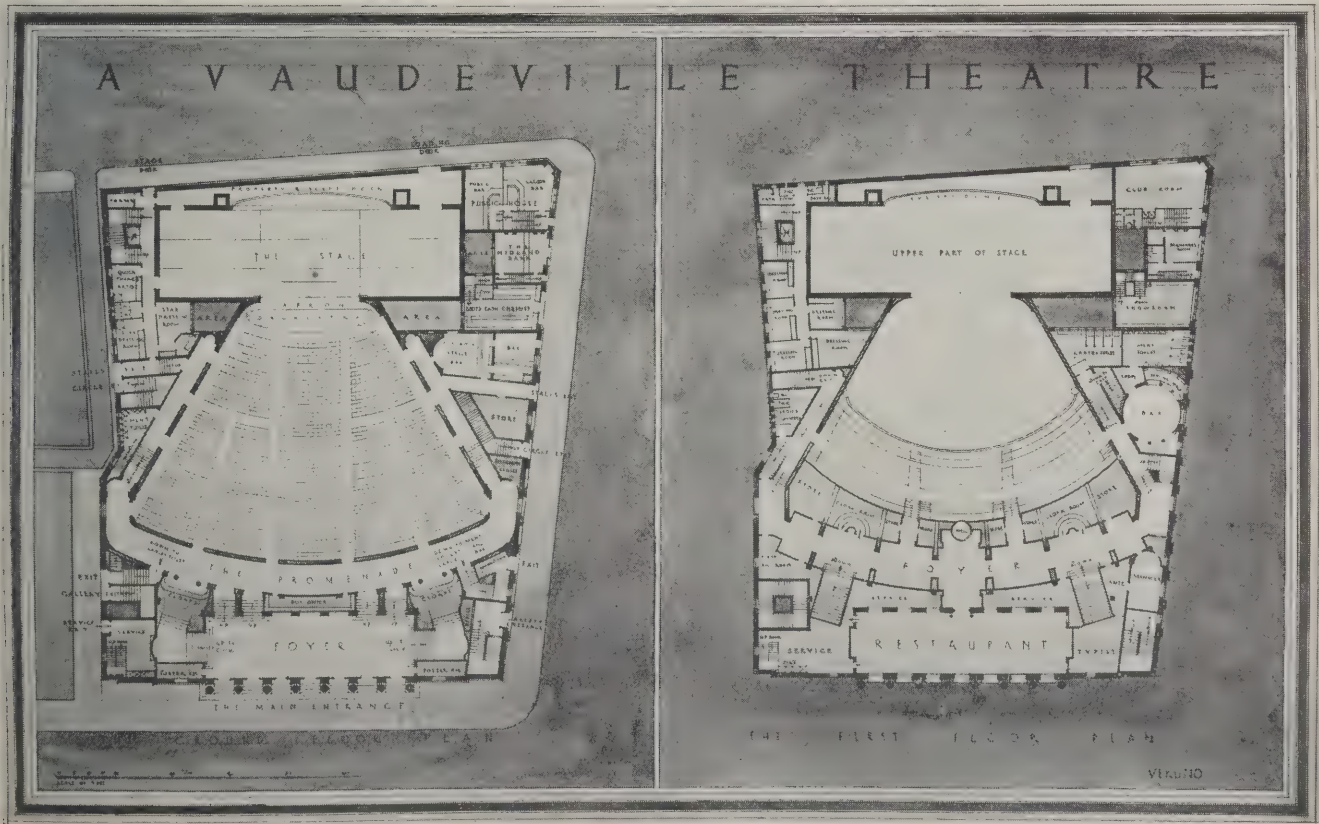

DESIGN FOR A BELVEDERE. TITE PRIZE.
WINNING DESIGN BY MR. E. B. CUMINE (ARCHITECTURAL ASSOCIATION)

DESIGN FOR A CIRCUS. VICTORY SCHOLARSHIP.
WINNING DESIGN BY MR. H. T. DYER.

NEW NEEDS AND MODERN NOTIONS—III

By EDWIN GUNN, A.R.I.B.A.

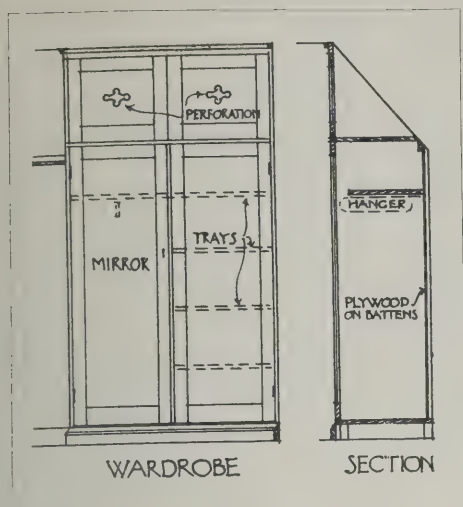

Fig. 5.

CLOTHING STORES.—The "builder's wardrobe"—a cupboard containing one wide shelf about 5 ft. from the floor and a few coat hooks screwed to the rail which supports it—ought to be as obsolete as the kitchen range. Without aspiring to the refinements of modern fitments such as the "Compactum," it is possible to instal at moderate cost a type of clothing cupboard which uses space to much greater advantage than is ordinarily the case. A width of 4 ft. or upwards centrally divided, one half with its wide shelf at 5 ft. but fitted below with a "Chalco" or similar type extending hanger, and with two rows of metal rods just clear of the floor, will accommodate suits or costumes and footgear; the other half with shelving (or preferably sliding trays) throughout at about 12-in. spacing takes folded underwear and similar articles, with the opportunity for withdrawal by sections. Tie-racks, trousers-stretchers, and such-like may be attached to the inner door face, and one of the doors opening out towards the room may be fitted with a mirror panel. Above normal door height an upper cupboard extending to the ceiling may be left open, without interior shelving, to contain hats or clothing out of season. A cupboard such as described and shown in Fig. 5 should cost under £10,

which, if more than the "builder's wardrobe" first described, is much less costly than any loose wardrobe of equal convenience, as well as saving labour in moving and dusting. It is a good practice to omit wall plastering within such a cupboard, and to line the back and sides instead with plywood. A hall cupboard is a convenient and seemly substitute for the untidy coatpegs or ugly "hall-stand" as a repository of outdoor clothing and sports implements. With a little thought in planning this may be used to achieve the pleasant result of a panelled Hall, as by the time all room doors and the cloak cupboard are accounted for there is usually little wall space left, so that this residue may as well be included and a continuous wood lining secured.

As well as the personal clothing referred to above, there is also the house linen to be stored in such positions that it remains dry and is readily accessible. The common provision for this is a small airing cupboard containing the hot tank or cylinder, which occupies so much of the space as to leave room for very little else.

Fig. 6.

Further more, though the warmth of such a situation is valuable for drying damp linen and is not prejudicial permanent storage for woollen articles, it is apt to spoil the colour of linen, which is better kept in cool, dry storage. The full provision in the normal house should embrace (a) the airing cupboard before mentioned which (contrary to oft-stated opinion) there seems little objection to placing in communication with the bathroom—provided that it is recognised as a passing resting place only, and permanent stores in addition are provided; (b) a linen store, ventilated and dry, these two requirements being met if the doors are perforated top and bottom with a few $\frac{3}{4}$ -in. holes and a single hot pipe on one of the domestic circuits is conducted through. A small window and a bench for checking and folding articles is a convenience where (as sometimes happens) these can be contrived without straining a plan—for remember that it is the economical house which is being considered;—without limitations anything can be done; (c) a blanket store for bulky woollens which are for long periods out of use. This can often be contrived, very much as described for the preserve cupboard, in upper space over either linen cupboard or the airing cupboard, or even above doorhead height in a minor passage—such as in Fig. 6 where it is formed over that leading to bath and W.C. The shelving in any of these three stores will of course be spaced

Fig. 7.

batten shelving, which may be conveniently made up in ledged sections for easy removal and cleansing. It will be found useful to fit airing-rails in the space around the tank or cylinder which is not available for shelving, and a brisk circulation of air is aided if a 4-in. iron flue pipe with cone-top is taken through the ceiling to the roof space. Advantage may sometimes be conveniently taken of the warm air outlet of this pipe by discharging below the cold tank above, which will thereby be protected from frost.

There remains one other aspect in which household linen and personal clothing are also involved—that of laundry or soiled articles. The much advertised provision of a chute from bathroom to scullery in certain houses does not appear altogether admirable, as not only would it appear difficult to keep clean but likely to conduct unpleasant smells (say cabbage water) to the upper regions. It is not clear either what is intended to happen to the clothing before or after it occupies the chute—unless it is intended to repose there accumulating from one washing day to the next. The American system by which a room in the basement is appointed as a properly fitted laundry, is quite another matter and a chute conducting there is admirable. Failing that provision, which our different type of planning usually precludes, a bin or cabinet on the upper floor for deposit of laundry-linen seems generally preferable to any kind of inaccessible flue or “chute.”

Another class of article for which some provision is advisable is outdoor cushions and rugs, which are conveniently housed in a locker or window seat in or near the Hall. Fig. 7 shows such a receptacle in conjunction with a cloak cupboard used to correct headroom allowance on a half-landing a few steps up from the Hall.

Book Reviews

An Outline History of Architecture of the British Isles. By P. L. Dickinson, F.R.I.A.I., M.T.P.I. London: Jonathan Cape. 15s. net.

Mr. Dickinson writes with considerable discernment and judgment, spiced with a sense of humour; but, despite his prefatory challenge, we are inclined to think that the vastness of his subject has sapped his sense of proportion regarding the relative importance of some parts of his survey. Indeed, we question whether any canvas of reasonable dimensions would be adequate to make an intelligible picture of the alien compositions, broken traditions and consequent loose ends which sums up the story of British architecture. The long-continued political isolation of the three kingdoms and their internecine warfare, precluded the possibility of a connected narrative. Yet the author's preliminary excursion with the dawn of architecture from China to Peru and Easter Island to Egypt, in search of the sources of British architecture, serves merely to point a moral on the external influences and conquests that have affected architecture everywhere. Britain has had its share of these, and all British art of importance owes its inception either to the introductions of conquering races or to native borrowings of the art motif of other countries. True that these alien motifs, once adopted, have been developed by the British on their own lines and invested with an insular spirit; but the problem for the historian, as we see it, is to decide just which of these introductions has been of most moment, either on the score of long continuance, traditional force or influence on subsequent periods and phases. Viewed from this standpoint, the rudimentary scratchings of cave-dwellers, the mud and wattle and Druidical remains of the early Britons, the forts and round towers of Ireland, and the Celtic brochs of Scotland

possess only an archæological interest. Even the great Roman era in England was so largely wiped out that only the widespread excavations in recent years have given us some insight of its extent and importance. Saxon architecture is largely legendary, a botching-up of Roman ruins, or a precursor of the subsequent Norman invasion. British architecture mainly begins with William I. Its next great change coincided with the arrival on the throne of Henry Tudor, after 27 years' exile in the higher civilisation of the Continent. A third movement was heralded by the arrival of another Royalist exile, Charles II., after 11 years' absence in France and Holland, and the fairly close intercourse with these countries that followed certainly paved the way for the advent of the Dutch ruler and his Huguenot art director. A fourth phase began when rising commerce and a flourishing agriculture furnished the wealth for the aristocrat and the rich merchant's son to make the “Grand Tour” and to impose their own ideas on the builders. A fifth phase was ushered in by the rise of industrialism, which reduced everything to chaos. Whether a sixth era will emerge it is too early to judge, but the rise of the Architectural Schools, where co-ordinated and progressive training for students replaces the eclectic fancies of individual principals, may lead to that result. In our view, Mr. Dickinson's outline is too heavily detailed in some parts, and too lightly sketched in others. The latter part of the book, in particular, suffers from somewhat hasty generalisation. To the professional reader this may not matter; he can be trusted to fill in the blanks. But if, as we assume, the book is intended for a wider audience, it will often have its readers in difficulties. Our chief quarrel, however, is with the illustrations. The author claims that he has avoided hackneyed examples; but we cannot regard it as a virtue in a “history” to omit the most important typical work of any particular period. In many cases of recent modern buildings, the architects' names are not given. Much has been written deriding English architecture of the last fifty years, but not of its domestic work. We cannot think the latter is adequately portrayed with one example each by Norman Shaw, Mr. Caröo, Sir Edwin Lutyens and Mr. Steward Watling, and three by Mr. Dawber, whose name is consistently misspelt. And in a book published in the autumn of 1926, the designer of Liverpool Cathedral ought not to be referred to as “Mr.” Scott.

British Standard Specification for Watertight Fittings for Incandescent Electric Lamps (No. 97). 1926.

This Specification, which is a revision of the 1920 edition, applies to fittings of the Bulkhead and Well-Glass types for use in conjunction with British Standard Lamps (B.E.S.A. Specification No. 161), having an overall length not exceeding 150 mm. and 140 mm. respectively. Copies of this new Specification may be obtained from the B.E.S.A. Publications Department, 28, Victoria Street, S.W.1, price 2s. 2d. post free.

Surface Brightness of Diffusing Glassware for Illumination. (H.M. Stationery Office) 9d. net.

In compliance with a request received from the British Engineering Standards Association, arrangements were made for experiments to be carried out at the National Physical Laboratory, with the object of obtaining reliable information on the properties of diffusing glassware, and the surface brightness of a number of bowls of different types was measured. The present report of the Illumination Research Committee gives the results of the work, which will be of interest to illuminating engineers, architects and others.

"TWO SPLENDID SKYSCRAPERS"

The Hotel Shelton and The Ritz Tower, New York

By HOWARD ROBERTSON. Photographs by F. R. YERBURY.

THE ZONED SILHOUETTE OF THE RITZ TOWER, LOOKING SOUTH ALONG PARK AVENUE.

EMERY ROTH, Architect. THOMAS HASTINGS, Associate Architect.

With the limitations of space which beset all those who build on Manhattan Island, it is not surprising to find that nearly every category of building is being tested out in skyscraper form. At first it was the congestion in the business districts in the lower part of the island which led to the cluster of tall shafts which greet the astonished gaze of those who approach New York for the first time by water, but congestion has crept uptown and even invaded those streets above 42nd Street which a short while ago were almost sacrosanct as regards any building higher than a paltry 12 stories.

Once started, the erection of skyscrapers in the uptown district has proceeded apace. Up till September 1 of last year plans had been deposited with the city authorities for more than seventy buildings of more than 12 floors, devoted to hotel or business purposes. Their total floor area was something like 15,000,000 super feet, which means a capacity of 75-80,000 people; the average for the complete year would mean, therefore, that fresh accommodation was being provided for about 100,000 people.

The building of 70 to 100 new skyscrapers every year entails, of course, increasing difficulties in traffic circulation, and it is obvious that the erection of tall buildings is preceding, rather than following upon, the provision of new transport facilities. A new underground line is at present being built, for example, along Eighth Avenue, which in the past has been only a moderately congested route. With the

prospect of the subway, however, a chain of skyscrapers has already sprung up, and no sooner will the new trains be put into commission than they will be filled by a new population of skyscraper dwellers.

The development of the type of building known as the apartment hotel has arisen partly as a natural result of lack of space in New York, but chiefly, perhaps, from the American domestic problem, which makes individual service prohibitive except for the wealthy. The apartment hotel has many points of similarity with the larger buildings of the service flat type in London, such as Queen Anne's Mansions, Whitehall Court, etc.; but as a rule the New York building is more highly organised both in its planning and fitting, and represents a much more highly developed study of the particular problem of space utilisation.

The land on which a New York apartment hotel is being erected is certain to be extremely valuable, so that the architect will be called upon to provide as many super feet of rentable space as possible. Very often the increase of a few inches in room width will make a very definite difference in the rental value of an apartment, which means that the type of construction will be very closely questioned from the standpoint of space, while speed of erection will also be another great consideration, as quite probably the apartment house owner will hope to rush through completion of his new building in time for the September season, when all rents take an upward turn.

THE RITZ TOWER: DETAIL OF LOWER STORIES JUST PRIOR TO COMPLETION.

EMERY ROTH, Architect. THOMAS HASTINGS, Associate Architect.

HOTEL SHELTON: DETAIL OF MAIN ENTRANCE. A. L. HARMON, Architect.

The most favoured construction, and one which was followed in both the Ritz and Shelton buildings, is steel skeleton with exterior curtain walls of brick; this type is nearly always used in buildings of more than 8 or 10 stories. Construction in reinforced concrete occasionally presents advantages where speedy delivery of steel would mean difficulty or expense, and if labour conditions are favourable it has been found to represent a slight saving over the steel frame in smaller types of building; but from the apartment hotel standpoint it has the drawbacks of taking up more space, and of being considerably less flexible, thus affecting the planning and room lay-out.

The apartment hotel does not cater for transients in the same way as a hotel apartment. In the first case, there is the desire to arrange for private flats or suites, the tenants of which will enjoy all the service and freedom from responsibility which characterise a well-managed hotel, while in the second case the hotel feature is naturally far more developed and the same privacy in each suite of apartments is not expected.

The New York building laws recognise as an "apartments hotel" any building in which the rooms are laid out in suites or apartments and the meals served from a main kitchen, while an "apartment house" is one in which the suites or apartments have individual kitchens or kitchenettes. As a matter of fact, many of the apartments in the "apartment hotels" are equipped with service pantries containing refrigerator, ovens, sink, etc.—in fact, complete kitchen appliances.

Apartment hotels such as the Ritz Tower and the Shelton provide, in addition to the suites of rooms, the facilities of a first-class club, and in fact the "public" accommodation is more along club lines than those of an hotel. The entrance halls and lobbies lack the numerous counters, enquiry and travel offices which line the vestibules of American hotels, and beyond the fact that there is a large bank of elevators, the effect is very similar to that of a swagger apartment house. There is no absolutely standard formula for the elevator equipment, as all depends on the

height of the building, the number of apartments per floor, and the type of patronage; but it is found that the average passenger service is met by a ratio of one elevator to about 150 rooms (not including services, sitting rooms, etc.) The passenger elevators are often placed in one group, which very frequently occupies a central position.

The public or "club" rooms are more or less developed according to type. In the Shelton they are very important, as can be gathered from the plans, and include very large dining and lounge rooms, together with a fine swimming bath, squash courts, and gymnasium. The latter are on the top floor, with, of course, a magnificent view, which is also enjoyed from the various roof gardens and terraces.

The architectural detail of the Shelton is extremely sound and refined, though not particularly interesting. Externally the splendour of the masses of buff brick and limestone dominate to such an extent that the somewhat trite handling of the ground and first stories are forgotten.

Internally, the lay-out is luxurious in spaciousness and the provision of ample sun and air, and the cleverness of the plan is thereby revealed. The individual suites are of all sizes, but mostly in small units of one or two rooms and baths, the rent per room being probably between £30 and £40 a month.

The Shelton is more of a hotel than is the Ritz Tower, which provides what are possibly the most expensive small apartments-de-luxe in all New York. In this case, as the plans show, there are suites of various sizes planned all on one floor, and also two-storey flats, known in the U.S. as "duplex" apartments, a type which is not, however, very popular in most of the latest apartment hotel buildings.

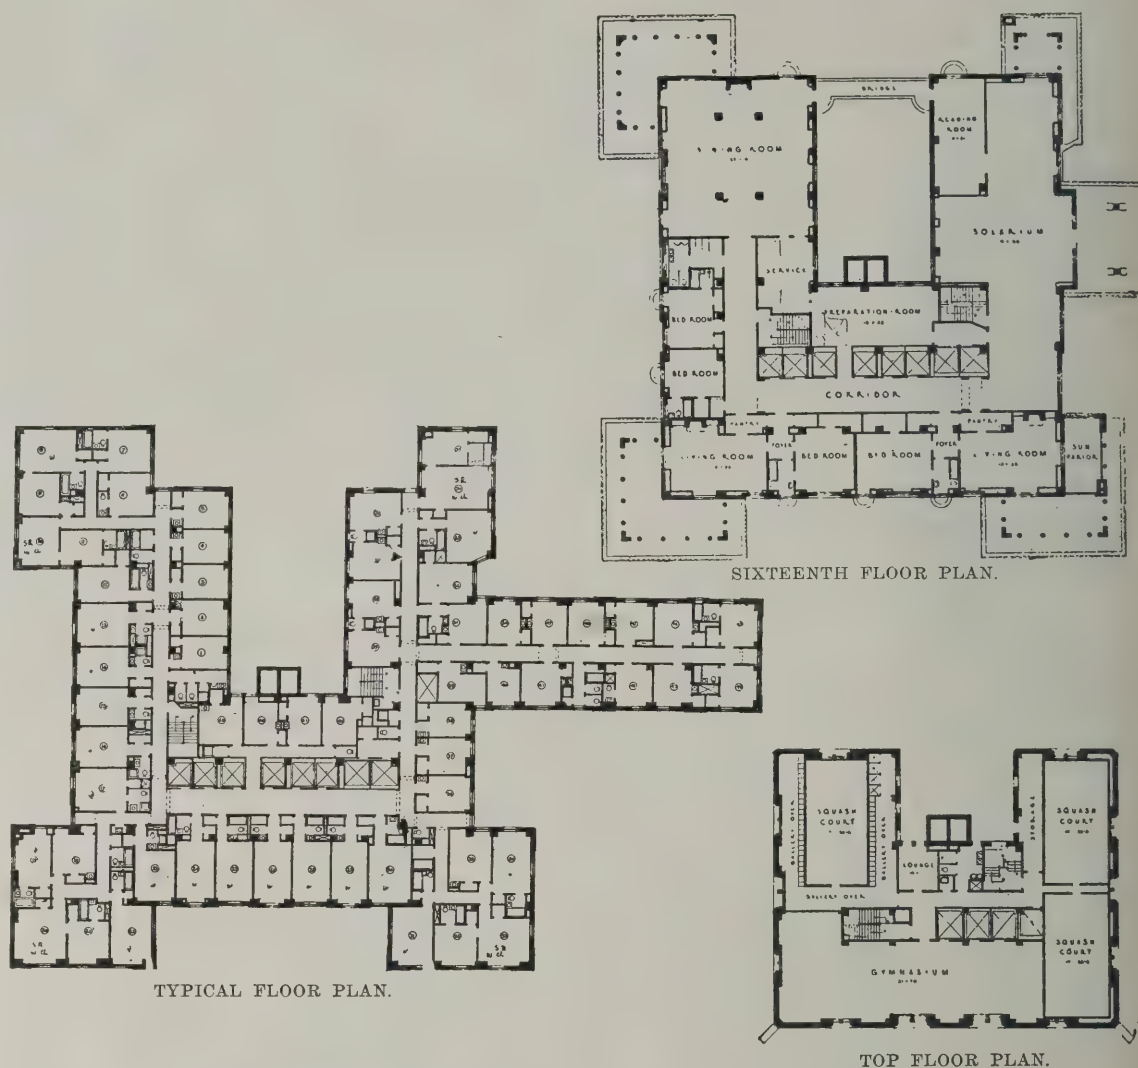

There is the advantage, however, in the Ritz Tower that some very fine two-storey living-rooms have been obtained through the duplex system, those in the tower being magnificent in planning and aspect.

The Ritz building has a perfect situation on Park Avenue and 57th Street, perhaps the finest residential "crossing" in New York. Its great interest from the architectural standpoint is its very cleverly

"zoned" silhouette, and the fairy grace which derives from the height and slenderness of its tower.

The summit is perhaps the least satisfactory feature of the mass, the roof and obelisks being a little trivial in conception and treatment; but the effect of the whole design from Park Avenue is perfect, since it is the only tower yet built in that street, and it occurs at precisely the point where, from the town planning

aspect, a strong vertical note is required as a relief to squatter and more box-like silhouettes.

As with the Shelton, the detail is a little disappointing. The Italian baroque note seems to have been sounded on a French horn, and the general effect of the lower stories is of familiar detail served up in restless shapes in order to support in some measure the drama of the soaring tower above.

Competition Notes

Students' Union, Glasgow

Architects in Glasgow are invited to submit designs for a proposed Students' Union, to be erected in University Avenue, Glasgow. Mr. James Kennedy Hunter, F.R.I.B.A. is the assessor. Applications for conditions of this competition should be made to Mr. Robert Brough, Hon. Secretary, Student Welfare Scheme, the University, not later than January 26.

Proposed New Academy at Perth

Over forty plans have been lodged in this competition, and the assessor is only now commencing his examination. It may be some weeks before he is able to make his award.

Exhibition of Modern British Architecture

The Annual Exhibition of Modern British Architecture will be held at the Royal Institute of British Architects from April 27 to June 3, 1927. All architects in Great Britain and Ireland are invited to send in not more than two works each. Particulars of the exhibition, together with instructions to exhibitors, may be obtained on application to the Secretary, R.I.B.A., 9 Conduit Street, London, W.1.

The Royal Institute of British Architects

PRIZES AND STUDENTSHIPS

(Continued)

The Council regret that they are unable to award the Royal Institute Silver Medal and £50 for an Essay.

THE HENRY SAXON SNELL PRIZE. £60.

Awarded to Mr. Graham R. Dawbarn, 1 Montague Street, W.C.1.

THE R.I.B.A. (ALFRED BOSSOM) TRAVELLING STUDENTSHIP, GOLD MEDAL AND £250.

Awarded to Mr. E. Wamsley Lewis (Architectural Association), 9 St. Edmunds Terrace, Regents Park, N.W.8. A Silver Medal and certificate of hon. mention awarded to Mr. B. W. R. Thomas, Briar Dene, North Road, Cardiff, and Silver Medals to Mr. E. H. Ashburner (B.Arch., Liverpool), 164 Willesden Lane, Brondesbury, N.W.6, and Mr. John R. Moore, 13 Acland Road, Willesden Green, N.W.2.

THE GRISSELL GOLD MEDAL AND £50.

Awarded to Mr. E. C. P. Allen (Architectural Association), 6 Belsize Square, Hampstead, N.W.3.

THE GODWIN BURSARY AND WIMPERIS BEQUEST. A SILVER MEDAL AND A SUM OF £250.

Awarded to Mr. J. Murray Easton, 36 Bedford Square, W.C.1.

THE ASHPITEL PRIZE, 1927.

Awarded to Mr. L. W. T. White, 80 Mayfield Street, Hull.

THE R.I.B.A. SILVER MEDAL FOR RECOGNISED SCHOOLS.

Awarded to Mr. J. Morrison, School of Architecture, Robert Gordon's Colleges, Aberdeen.

THE R.I.B.A. BRONZE MEDAL AND £5 IN BOOKS FOR RECOGNISED SCHOOLS.

Awarded to Mr. E. B. O'Rourke (Architectural Association), London.

The Competition Drawings will be on exhibition in the R.I.B.A. Galleries, 9 Conduit Street, W.1, from January 17 to January 31, 1927, inclusive, between the hours of 10 a.m. and 8 p.m., Saturdays 10 a.m. and 5 p.m. (Sundays excluded).

Competitions Open

BIRMINGHAM CIVIC CENTRE

Competitive plans are invited, not only from this country but abroad, for the development of the future civic centre of Birmingham around the Hall of Memory. The assessor is Mr. H. V. Lanchester, F.R.I.B.A. First premium £1,000 and a further sum of £1,000 will be divided among other competitors on the recommendation of the assessor. Sending-in day, June 30, 1927. Conditions can be seen at this office.

LEAGUE SECRETARIAT AND ASSEMBLY HALL, GENEVA

Full particulars of this competition were published in this issue of August 13, 1926. Designs must be dispatched not later than January 25, 1927, and all plans reaching the Secretariat after March 31, 1927, will be disqualified.

INCORPORATED ARCHITECTS IN SCOTLAND

This competition is open for the Rowand Anders Medal and £100, for a City Art Gallery and Museum; the Rutland prize of £50 for Study of Materials and Construction; prizes of £10 to £15 for Third Year Students in Scotland and a Maintenance Scholarship of £50 per annum for three years. Particulars from the Secretary the Incorporation, 15 Rutland Square, Edinburgh.

PETERBOROUGH MUNICIPAL COMPETITION

In connection with the £200,000 scheme to widen Narrow Street, Peterborough, the Peterborough Town Council are considering proposals for the provision of municipal buildings on the upper floors, and at the rear of the new premises to be erected in the newly constructed street. The Council propose offering a prize of 250 guineas for the best plan submitted. A second prize of 100 guineas and a third prize of 50 guineas will also be offered. The city engineer estimates that the erection of shops and offices will cost £82,800, and the erection of municipal buildings and shops £158,308.

NEW TOWN HALL AND LIBRARY, LEITH

Conditions and plans for this competition are being prepared. Assessor, Sir George Washington Brown, R.S.A. Particulars from City Chambers, Edinburgh.

RAWMARSH MEMORIAL

The Rawmarsh and Parkgate War Memorial Committee invite architects to submit designs for this Memorial. The cost, inclusive of fees, not to exceed £2,000. The successful competitors will be invited to act as architects for the erection of the Memorial. A plan of the site may be obtained from Mr. J. A. Tonge, L.R.I.B.A., Surveyor's Office, Parkgate, Yorkshire.

UNIVERSITY OF WESTERN AUSTRALIA

Designs are invited for buildings to cost £150,000, include great hall, offices, etc. Premiums of £300, £200 and £100 are offered respectively. Closing date, August 23. Conditions will be obtainable about the end of January from the Agent-General for Western Australia, 115-1 Strand, W.C.2.

SHAKESPEARE NATIONAL MEMORIAL THEATRE

The Governors of the Shakespeare National Memorial Theatre invite architects to submit designs for the Shakespeare National Memorial Theatre, Stratford-on-Avon. The competition will be open to architects of the British Isles and America. It will be in two sections—a preliminary competition for sketch designs only, from which six designs will be selected by the assessors: Mr. E. Guy Dawbarn, President, R.I.B.A., and Mr. Cass Gilbert, President of the National Academy of Design of America (who will both act in an honorary capacity), and Mr. Robert Atkinson, F.R.I.B.A. Each of the selected competitors will be paid £100 premium towards the cost of preparing further more detailed design, which will form the second half of the competition. The selected architect will be paid in accordance with the schedule of charges sanctioned by the Royal Institute of British Architects. Conditions of competition, with site plan, etc., can be obtained from the Secretary, Shakespeare Memorial Theatre, Stratford-on-Avon, on payment of a deposit of £1 ls. (which will be refunded should the conditions be returned within one month). Preliminary designs must be delivered to Stratford-on-Avon not later than June 15, 1927.

UPPER PART OF DECORATION FOR WAR MEMORIAL, DURBAN.

By HAROLD AND PHOEBE STABLER.

H. L. J. PILKINGTON, Architect.

THE ARCHITECTURAL ASSOCIATION

On Monday of last week Mr. Harold Stabler delivered an address, at a general meeting of the Architectural Association, 35 Bedford Square, W.C.1, on "Glazed Sculpture." Mr. J. Alan Slater, M.A., F.R.I.B.A. (president), occupied the chair.

In the course of his paper Mr. Stabler said that by "Glazed Sculpture" he meant the bigger or architectural work, and not the small glazed figures of which great numbers had been produced during the last fifteen or twenty years on the Continent, and to a limited extent in this country.

In reviewing the work of the past, the lecturer said he was going to make one great omission and leave out the work of the Della Robbias and their school. They were all familiar with that work and it was a vast subject which required an evening to itself. The history of glazing started over 4,000 years ago. Glazing was known, too, in Egypt at an early date, and it was more than likely that Mesopotamian and Egyptian glazing had a common origin.

About 1200 B.C. they found the Assyrians protecting the painted surfaces of bricks—or slabs of clay—with glaze, which was "slipped" and "painted" like the inscribed cylinders. The Assyrians for their buildings used chiefly stone, which was easily accessible to them. For the decoration of their buildings they carved great bas-reliefs in a kind of alabaster, illustrating their triumphs and activities. These reliefs were coloured like most early architectural decoration, and were the fore-runners of Babylonian glazed brickwork. The Babylonians not having stone at hand naturally used clay for the most part for their building.

Dealing with modern work in glazed ware, the lecturer said his feeling in designing in this material was that the effect should be sharp and crisp, and that very careful attention must be given to pattern and colour. The colour was an added thing with which the artist could play; in its right place and properly used, colour ought to contribute to the interest and to keep the carry power and the distant view. On a piece of work of the scale of the Durban Memorial, which was 21 ft. high and weighed 14 tons, great care and calculation was necessary before starting. The 14 tons of clay had to be erected, hollow, and without armature of strengthening such as sculptors could use in making models; it had projections of 17 ins. and had to be kept in position for four months after it had been made. A model, very accurate to scale, was made, and from this full-size sections were taken off on to three-ply wood by a scale-pointing machine. The whole of the clay was then moulded on an enormous easel, sloping to the back at the top, and with projections or ledges to support the clay. The whole of the easel was made so that sections could be taken down from the back in order to be able to get at the back of the clay in order to keep it moist. Another difficulty was the shrinkage of clay and the necessity of protection from damp, wind and frost. After it had been made, the piece was cut into sections with an average weight of about 2 cwts.; this was necessary in order to fire it, as the kiln would not permit of larger pieces being fired even if it had been possible to lower them to the ground without damage. Finally the glaze was applied to the pieces, and after firing they were assembled and sent to Durban.

Messrs. Walter Bayes, Gordon Hake, and Gilbert Jenkins took part in the ensuing discussion.

BUILDING CRAFTSMANSHIP—OLD AND NEW—III

By Nathaniel Lloyd, F.S.A.

AN OAK GARDEN SEAT, SUGGESTIVE OF A CHARLES II CANED CHAIR, NOT ONLY BY THE SHAPE AT THE END, BUT ALSO BY THE COMFORTABLE ANGLE OF THE SEAT AND BACK.

THE CAMBER OF THE BACK RAILS AND THE CURVED BRACES GIVE RHYTHM AND CHARACTER TO THIS SEVERELY SINGLE DESIGN; THE SEAT BOARDS ARE LOOSE AND REVERSIBLE.

THE CRAFT OF THE CARPENTER

By Nathaniel Lloyd, F.S.A.

THE FRAME AND FOLDING GATES OF THIS GARDEN GATEWAY (THE BARS OF WHICH ARE FIXED LOZENGE FASHION) ARE SET BETWEEN A PAIR OF SIMPLE BUT GOOD BRICK WALLS.

FITNESS AND STRENGTH ARE THE TWO FIRST ESSENTIALS OF OUTDOOR FURNITURE: THE TABLE AND FORM, IN THE 15TH CENTURY MANNER, ARE ALMOST PRIMITIVE IN DESIGN BUT ADMIRABLY SUITABLE FOR THIS SETTING.

London Building Notes

BARKING.—Extensions are being commenced, whilst several others are in the projected stage, for the enlargement of the Barking Power Station, owned by the County of London Electric Supply Co., Ltd., Moorgate Street, E.C.2. The main building will be erected by Messrs. International Combustion, Ltd., Kingsway, W.C.2, the steelwork being supplied by the Cleveland Bridge and Engineering Co., Ltd., Darlington. The plans have been drawn by Sir Alexander Gibb and Partners, consulting engineers, Queen Anne's Lodge, Queen Anne's Mansions, S.W.1.

BATTERSEA.—New school buildings are being erected at the Sir Walter St. John's Schools in Battersea High Street, S.W.11, at a cost of about £25,000. Plans have been prepared by Mr. A. H. Ryan Tenison, F.R.I.B.A., 21, St. Peter Street, S.W.1.

BERMONDSEY.—It is proposed to put in hand shortly a scheme for the pulling down of old houses and the erection of new tenements in the Vanber Street area. The Bermondsey B.C. have commissioned Messrs. Culpin and Bowers, 3, Portsmouth Street, W.C.2, to prepare the plans.

CHISWICK.—Among Parliamentary Bills to be considered this session is one for the proposed erection of a "super" power station at Duke's Meadows, Chiswick, W., where a site of 40 acres has been selected. The projected station involves considerable building work, and will be designed by Messrs. Preece, Cardew and Rider, 8, Queen Anne's Gate, Westminster, S.W.1, for the London and Home Counties Joint Electricity Committee.

COVENT GARDEN.—A site at the corner of Wilson Street and Arne Street, W.C., is being cleared of old buildings by Messrs. Henry Greenham, Ltd., Warton Road, Isleworth, prior to being taken over by the building department of Messrs. Odham's Press, Ltd., for the erection of new offices and works. Plans have been prepared by Messrs. Francis Chambers and Son, architects, 119, College Hill, Cannon Street, E.C.4.

DUKE STREET.—Plans have been completed for the rebuilding and modernisation of the public-house in Duke Street, W.1, known as the "Devonshire Arms," the cost of which will be about £15,000. The owners are Messrs. Hoare and Co., Ltd., brewers, of St. Katherine's Way, E.1, whose architect is responsible for the designs.

EAST SHEEN.—The East Sheen Cinema is to be rebuilt and enlarged, to plans prepared by Messrs. Grainger and Leathart, A.A.R.I.B.A., of Adelphi Terrace House, W.C.2, acting on behalf of the owners, Messrs. Joseph Mear's Theatres, Ltd., 5, Hill Street, Richmond. The new building is being designed to hold about 1,500 persons, and will be reconstructed by Messrs. Joseph Mears, Ltd., builders, Crabtree Wharf, Fulham, S.W.

HATTON GARDEN.—A block of office premises, with showrooms on the ground floor, is to be built on the site of Nos. 12 and 13, Hatton Garden, E.C.1, and the old buildings have now been pulled down. The contract for the new building has been placed with Messrs. W. J. Mitchell and Sons, Dulwich Village, S.E.21. The architects are Messrs. Clifford Tee and Gale, 50, Moorgate, E.C.2.

HESTON, ISLEWORTH.—Plans have been completed for the carrying out of the alterations and additions to the Mogden Hospital for the Richmond and Heston-Isleworth Isolation Hospital Board. The scheme includes a new ward block, which has been designed by Messrs. Adams, Holden and Pearson, F.F.R.I.B.A., 9, Knightsbridge, S.W.

HIGH STREET.—A frontage in Camden Town High Street, N.W., is to be pulled down and rebuilt in connection with the reconstruction programme of Messrs. Marshall Roberts, Ltd., drapers and furnishers. An extensive emporium, with shop fronts on the ground floor and showrooms on the upper storeys, has been planned by associated architects, Mr. M. K. Matthews, 72, Tottenham Court Road, W.1, and Messrs. Kitchin & Archibald, of Middlesbrough.

HIGHGATE.—The "tube" terminus station at Highgate, N.W., is to be completely modernised and enlarged, and the works proposed include the introduction of escalators and the building of a new booking hall, waiting-rooms, shops, etc. The design will conform to the Morden line stations planned by Messrs. Adams, Holden & Pearson, F.F.R.I.B.A., 9, Knightsbridge, S.W.1. The architect to the "Underground" group is Mr. S. A. Heaps.

HOUNSLOW.—A new baptistry window in St. Paul's Church, to the memory of the late Rev. A. E. Bull, has been designed, and will be shortly submitted to the church council for approval.

ILFORD.—Plans have been approved for the rebuilding of the public-house in Cranbrook Road, Ilford, known as the "Chequers Inn." The property is owned by the London and Burton Breweries, Ltd., of Burton-on-Trent, for whom Mr. William Stewart, F.R.I.B.A., Newlyn House, Aldgate, E.1, is acting as architect.

KINGSBURY.—Extensions are to be effected to the Smallpox Hospital at Kingsbury by order of the governing committee. Plans have been prepared by Mr. F. Wilkinson, Town Hall, Dene Road, Kilburn, N.W.6, showing a new administrative block, ward block, laundry, caretakers' lodge, out-buildings, and the reconditioning of the present ward blocks.

LAMBETH.—It is proposed to completely rebuild the Borough Polytechnic Institution in Borough Road, S.E.1, at a cost, excluding site, of £80,000. The scheme will be carried out in sections, and the new buildings

have been designed by Mr. W. Courtenay Le Maitre, F.R.I.B.A., 133, Moorgate, E.C.2.

LEICESTER SQUARE.—The Empire Theatre in Leicester Square, W.1, is now closed, and will shortly be taken over by Messrs. Henry J. Greenham, Ltd., Isleworth, Middlesex, for the work of demolition. The pulling down and excavation of the site is expected to occupy about two to three months, after which the builders, Messrs. F. D. Huntington, Ltd., Broadway Chambers, Hammersmith, W., will start on the foundations. The new cinema, which will seat 3,500 persons, costing £750,000, has been designed by Messrs. Frank Matcham & Co., 9 Warwick Court, High Holborn, W.C., in association with Mr. Thos. Lamb of New York.

LITTLE PORTLAND STREET.—A new warehouse is to be erected in Little Portland Street, W.1, consisting of 4 storeys, the steel work now being in position. The builder is Mr. E. A. Burgess, 45 Berners Street, W.1. The plans have been prepared by Messrs. Elgood & Hastie, 93 Wimpole Street, W.1.

MARYLEBONE.—A row of shops, etc., are being erected in Baker Street, W.1, on the site of Nos. 1-5. Plans have been prepared by Mr. S. Gordon Jeeves, architect, 16 Hanover Square, W.1. The builders are Messrs. Harry Neal, Hendon Central "Tube" Station, Hendon, N.W.

OXFORD STREET.—A block is being erected at the rear of the showrooms in Oxford Street, W.1, of Messrs. C. & A. Modes, Ltd., costumiers, with a frontage in Bird Street. A building of four floors and basement has been designed by Messrs. North, Robin & Wilsdon, 35-39 Maddox Street, W.1. The builders are Messrs. Nox, Ltd., 44 Praed Street, W.2.

RICHMOND.—Plans have been approved for erection of a further block of 44 flats at the Poppy Factory on the Cardigan House Estate in Petersham Road, for the British Legion. Work on the first block was commenced some time ago by Messrs. R. Dixon & Sons, Britannia Works, Park Walk, S.W.10. The architects are Messrs. Douglas' Wood & Lloyd Thomas, F.F.R.I.B.A., 35 Craven Street, Strand, W.C.2.

SLOANE SQUARE.—The Court Theatre in Sloane Square, S.W., is to be closed on January 29 for a period of about one month, in order to carry out a scheme of redecoration and refurnishing. The work will involve several thousand pounds, and will be carried out under the supervision of the directors.

STOKE NEWINGTON.—A site situated at the junction of Woodbery Down and Seven Sisters Road, N.1, has been selected by the St. Olave's Church Council as a suitable location for their proposed new church hall. Plans will shortly be put in hand, a committee having been formed under the chairmanship of the Rev. D. G. B. Macrae, vicar of St. Olave's.

New Factory for Messrs. Carreras, Mornington Crescent, London, N.W. 1

MESSRS. M. E. & O. H. COLLINS AND A. G. PORRI, Architects.

Work has now commenced on the foundations of what will be the largest reinforced concrete building in London, a tobacco factory for Messrs. Carreras. This building, illustrated above by a perspective sketch, shows the completed block having a frontage of 600 ft. It is 200 ft. deep and 75 ft. above the pavement level, with a basement 10 ft. high below. The total floor area is 9 acres, and the roof is of concrete laid flat. The floors are supported by octagonal columns, connected with beams at approximately 17-ft. centres, making each floor slab about 17 ft.

square, and the careful shuttering for the walls will obviate inside plaster rendering. A flat Egyptian pylon treatment has been adopted for the front elevation, all in precast concrete, and it is intended to give emphasis to the decorative features peculiar to this treatment by the use of colour. The architects are Messrs. M. E. and O. H. Collins, of 115 Old Broad Street, E.C., in collaboration with Mr. A. G. Porri, of 37a Finsbury Square, E.C. The consulting reinforced concrete engineers are Messrs. Consideré Constructions, Ltd., and the contractors Sir Robert McAlpine and Sons, of London and Glasgow.

The Week's Building News

The following abbreviations are used: U.D.C. for Urban District Council; T.C. for Town Council; R.D.C. for Rural District Council; E.C. for Education Committee; B.G. for Board of Guardians; P.C. for Parish Council; B.C. for Borough Council; M.H. for Ministry of Health; M.T. for Ministry of Transport; C.B. for County Borough; B.E. for Board of Education.

ABERYSTWYTH.—Plans of the new casino hotel to be erected on the site of the old Waterloo Hotel, at a cost of £60,000, have been passed by the T.C.

ACTON.—The Acton Hospital Committee have approved plans showing an extensive scheme of repairs and extensions, which are estimated to cost £24,000, with £2,000 for equipment.

ALTRINCHAM.—The Cheshire E.C. approved the County architect's scheme for the extensions at the C.H. Girl's School, at a cost of £5,000. The scheme is to be forwarded to the B.E. for approval.

ASHBOURNE.—The U.D.C. propose to reconstruct the cattle market, at an estimated cost of £2,000.

AYRSHIRE.—At a meeting of the Carrick D.C. it was reported that the Board of Health had approved of the Patna building scheme, and that the County Finance Committee had approved of the loan of £5,000 for this purpose, and that work on the new houses had commenced.

BANGOR.—The Housing Group of the local branch of C.O.P.E.C. has decided to build 20 houses on the Friars Estate, to plans prepared by Mr. J. Gill, the former borough surveyor. The cost of the scheme is estimated at £6,000.

BEBINGTON.—The Cheshire E.C. approved the County architect's scheme, with amended plans, for the erection of the proposed Bebington County Schools, involving an expenditure of £92,350.

BINGLEY.—The West Riding E.C. contemplate the erection of extensions at the Bingley Grammar School, estimated at £26,050; the erection of a new secondary school and technical school at Brighouse, at an estimated cost of £63,940; and the purchase of sites as follows: 10½ acres at Northgate Mount, Honley, for a secondary school; 8,600 square yards on the north-west side of Mount Pleasant, Pudsey, for a secondary school; and of 5 acres at North Elmsall, for a new school. The provision of new schools at Hatfield and Birkenshaw, estimated at £18,000 and £6,600, has also been sanctioned.

BIRMINGHAM.—The Public Libraries Committee are to erect a new public library in Washwood Heath Road. Tenders have been invited, but no contracts have been placed. The architects are Messrs. John P. Osborne & Son, of 95 Colmore Row, Birmingham.

BIRMINGHAM.—The City Council are to erect 10 parlour type houses at Erdington, and 22 parlour type houses at Erdington; 23 parlour type houses in War Lane, Harborne, and 2 parlour type houses in Vicarage Road, Harborne, and 2 parlour type houses in Elm Tree Road, Harborne. Tenders are being invited for their construction. A new hotel, with 200 bedrooms, is to be erected in Moseley Road.

BRADFORD.—The Valley Road Electric Works, Bradford, are to be extended at a cost of £300,000, and includes the provision of additional plant.

BRADFORD.—Communal building projects which, if they are all carried out, will require the raising by public subscription in Bradford of about £500,000, are being contemplated or actually prosecuted by various public bodies. The most important scheme is that for a new infirmary, to cost approximately £250,000. The proposed new Grammar School will cost about £80,000. The Bradford Royal Institution for the Blind requires £20,000. There is a project for the building of a new cathedral, incorporating the present one, at a cost of from £150,000 to £200,000.

BRAY.—The U.D.C. is urging the Great Western Railway to rebuild the Marine Station Hotel, Bray, for which £13,000 compensation was awarded.

BROMSGROVE.—The U.D.C. propose to purchase 14,000 square yards of land at Sidemoor, for £1,125, with a view to embarking upon another housing scheme. The U.D.C. decided to build 6 houses at Chaddeley Corbett.

BROMSGROVE.—The U.D.C. has decided to make an offer of £1,125 for a site in Broad Street, Sidemoor, for another housing scheme.

CARLISLE.—The Council have decided to build 150 more houses in order to avail themselves of the subsidy.

CARRICK.—The District Committee has agreed to proceed with the Patna housing scheme, for which the Finance Committee has approved of the loan of £5,000. Work on the new houses has commenced.

CHESHUNT.—The Co-operative Society propose erecting new business premises at Turner's Hill, Cheshunt.

CLAPHAM.—Public baths are to be built at Clapham.

CRADLEY HEATH.—A new model factory has been erected at Newtown, Cradley Heath, for The Valeting Service Co. The whole of the lay-out was designed by Mr. Stanley A. Griffiths, architect, of Stourbridge.

CREWE.—The Corporation are considering a scheme which, if adopted, will completely transform the centre of the town. The proposal is to demolish practically the whole of High Street and Exchange Street, and re-build it on the lines of a "circus." The Council have decided to erect another 150 houses. About 20 of them will be built by direct labour.

DARLASTON.—The sanction of the M.H. has been received to a loan of £1,472, for the purchase of land off Dorsett Road, and a loan of £14,210, for the erection of 32 houses there. The architect to the Staffordshire E.C. has submitted plans for new schools at Slater Street.

DEWSBURY.—The West Riding E.C. are to erect a boys' secondary school and a technical school at Dewsbury at a cost of £63,940.

DUBLIN.—The Management Committee of the Jervis Street Hospital propose erecting a new hospital to plans prepared by the hospital architect, Mr. Ralph Byrne, F.R.I.A.

DUDLEY.—The T.C. are to proceed with the erection of new baths, at an estimated cost of £25,000, and tenders have been invited for their construction. The new building will be of ferro-concrete, and will be erected on the site of the present baths. Mr. F. H. Gibbons, M.Inst.M. & Cy.E., is the Borough Engineer, and Mr. Henry Vale, F.S.I., of Wolverhampton, has prepared the bills of quantities.

DUNDEE.—The late Mr. William Gibson, Broughty Ferry, has left £25,000 to the Dundee University College for the building and equipping of a laboratory for study and research in pathology and bacteriology.

DUNMOW.—The Galway Board of Health propose erecting a reservoir at Carromosear South for the storage of water for Dunmow.

ELLESMERE PORT.—The Cheshire E.C. decided to have plans prepared for a new Council school in Gra Road, to replace the Ellesmere P.O.M. School.

ENFIELD.—A site has been purchased for the erection of new branch stores, by the Co-operative Society at Gordon Hill, Enfield.

ENFIELD.—The District Council have decided upon the erection of 50 houses on the Albany site near Albany Park, to designs prepared by the surveyor; 250 are to be erected under the 1923 Act and 250 under the 1924 Act, the proportion to be 50 per cent. type A and 50 per cent. type B: 2 bedrooms, in blocks, and 3 bedrooms in blocks, respectively.

FALMOUTH.—The T.C. propose erecting another 121 houses on the Perris site.

FINSBURY.—The Council is to borrow £56,946 for erecting houses on Mantell Street, N.

GLASGOW.—The Housing Department of Glasgow Corporation have viewed the erection of 2,000 houses at Carntyne, in the vicinity of the Glasgow-Edinburgh road, to be let at rentals ranging about 12s. per week. The Housing Committee decided to commend the Corporation to acquire 210 acres of ground for the purpose at Carntyne at a price which would work out at £111 per acre.

GRANGEMOUTH.—The Grangemouth Dean of Guild Court recently granted warrant to the T.C. to build 52 houses—16 of two rooms and kitchen, and 36 of one room and kitchen. The houses are to cost £409 each, and 136 houses £363 each. Formal warrant was also given in connection with a block of four flatted houses which are being erected under the own

The Hall Mark of Your Craftsmanship

IN our preceding announcement we have endeavoured to point out something of the ideals in Craftsmanship that go in making of "Crabtree" Products—the same ideals as were an all-impelling force to the old-time Craftsmen.

We have ever affirmed that these ideals are a vital factor in the Industries of to-day—that the standard of quality in each component part of an electrical installation, for example, reflects the good taste of those responsible for the selection of the accessories used.

During the few short years in which "Crabtree" Products have attained a distinctive position in the Electrical Industry, we have asked no favours, but have simply given of our best in inspiration and research—in sincere quality and tested efficiency, with the result that it is more than ever realised that the "Products of Craftsmen" set the seal of excellence on each installation.

A Hallmark of your Craftsmanship—the products of

occupier scheme. The price of these houses, after deduction of £110 subsidy, will be £385 (ground floor house) and £395 (upper floor).

GREENWICH.—The Council is to erect 102 houses on the Twenty Acre Field, Charlton, S.E.

HAMPTON.—The D.C. have approved a scheme for the erection of 20 houses on the Hanworth Road site. Representations are to be made to the B.E. to sanction the erection of a new mixed school at Hampton Hill.

HEMSWORTH.—The Joint Hospital Committee are to erect a modern laundry at the Hemsworth Isolation Hospital, Brierley Common, at a cost of £3,500.

HITCHIN.—The B.G. have proposed to make alterations to the workhouse, at a cost of about £8,000. Mr. S. B. Russell (architect) has submitted plans of the alterations.

KEIGHLEY.—Tenders are invited from all trades, except carpenters and joiners, for the erection of a pair of semi-detached bungalows at Riddlesden, Keighley, by Moore & Crabtree, architects, 96 Cavendish Street, Keighley.

KIDDERMINSTER.—The R.D.C. propose erecting 16 houses in Wolverley and Cookley, and 6 at Chaddesley Corbett.

KIVETON.—Kiveton Park R.C. recently approved of plans for a Mining Technical School at Dinnington, to be erected at a cost of £23,000, of which £17,000 is to be provided by the Miners' Welfare Fund.

KNEBWORTH.—Mr. Souter, architect to Lord Lytton, is the architect of 26 houses which are to be built by the Hitchin R.D.C.

LEEDS.—The Leeds Corporation have decided to erect 800 houses on the York and Selby Road Housing Estate, and tenders are to be shortly invited.

LONDON.—Plans are being prepared for the erection of new premises for the Co-operative Society at Bush Hill Park.

LONGFORD.—The Longford Board of Health Committee are to apply for sanction to borrow £4,300 for a scheme of repairs to the Longford County Hospital and County Home.

LUTON.—The R.D.C. have passed plans for 20 houses and extensions to a factory.

MIDDLESEX.—The C.C. is to build a tuberculosis dispensary at Harrow.

NEW BARNET.—A new hall is to be built for St. Augustine's Church on a site adjoining the Church in Plantagenet Road. A church house is also to be built at Cockfosters (nr. Barnet).

NEW MALDEN.—The D.C. have approved a scheme for the erection of more flats in California Road.

NEWPORT.—The U.D.C. propose to proceed with the erection of 12 non-parlour houses and 4 parlour houses, and application is to be made to the M.H. for sanction to the necessary loan. Mr. R. C. Bryan is to prepare the plans.

NORTH BROMSGROVE.—The U.D.C. have approved a big private housing scheme at Rubery. An application was made by Mrs. N. C. Smith for the variation of the Rubery Town Planning scheme with a view to the

development of a building estate between Callowbrook Lane and Gunners Lane, and involving the erection of some 380 houses. The Council decided to recommend the whole of the houses for the Government subsidy, amounting in the aggregate to £26,176, subject to the approval of the scheme by the M.H.

NORTH FINCHLEY.—Amended plans for alterations at the Moss Hall Tavern, North Finchley, were recently approved by the Highgate Bench.

PENZANCE.—The T.C. have under consideration the acquiring of two sites for housing purposes.

RUGELEY.—The U.D. have instructed the architect, Mr. W. E. Rogers, to prepare plans for an additional 18 houses which the Council has decided to erect on a new site in Talbot Street.

SHEFFIELD.—Excavation work has begun on the site for the new super-cinema to be erected in Barker Pool, Sheffield, by the Provincial Cinematograph Theatres, Ltd., at a cost of over £100,000.

SHEFFIELD.—The Library Museums Committee of the Sheffield City Council are to prepare plans for the erection of a new branch library at Hillsborough, Sheffield.

SLOANE SQUARE.—Sloane Square Station is to be reconstructed. The scheme of reconstruction includes the replacement of the existing surface buildings by a structure of Portland stone, modelled on the lines of the stations on the Morden line.

ST. ALBANS.—The R.D.C. have decided to build 20 cottages—16 of the three-bedroomed type and 4 of the four-bedroomed type—at Wilkins Green.

STEPNEY.—The Council is to build 154 maisonettes at Buck Yard, E., at an estimated cost of £84,000.

STOCKSBRIDGE.—A new school is to be built at Stocksbridge. Tenders are being sought for the erection of this building, described as an elementary and middle school, on a site of nine acres, between the Garden Village and the Urban District Council's building estate near Spink Hall, at an altitude of 700 feet. The combined schools will have 1,050 places, and the cost will exceed £30,000.

STOKE-ON-TRENT.—The Sutton Trustees are to build 200 working-people's houses at Trent Vale, Stoke-on-Trent, the scheme costing £100,000.

SUSSEX.—In connection with the centenary of the Royal West Sussex Hospital an important scheme of extension has been prepared by the Board of Management. It is proposed (1) the improvement and electrification of the two lifts; (2) additional accommodation for the nursing staff; (3) a separate ward for maternity patients.

TRURO.—The City Council have approved plans for the erection of 12 small type houses on land near the children's playground at Hendra, which, with sewers, are estimated to cost £4,500.

UPPER BRYNAMMAM.—A site has been obtained for the erection of new premises for the Co-operative Society.

WALSALL.—Loans have been sanctioned by the M.H. for £2,538 for the construction of roads and sewers on

the Four Crosses Housing site, and for £75,243 for the erection of working-class houses on the Beatrice Street site at Leamore. Tenders were accepted by the T.C. for the erection of 12 flats at Leamore and for 57 houses at Leamore, Bloxwich and North Walsall. A site for the new maternity home is being considered.

WANDSWORTH.—Plans passed by the B.C.: Messrs. R. Dix & Sons, workshops and garages, 66 Deodar Road, Putney; Messrs. C. F. Kearley, Ltd., 8 houses, eastern side of Roehampton Lane, Putney; Messrs. Swain & Selly, 53 houses in proposed roads Nos. 1 and 2 Park Hill Estate, Balham; Messrs. H. F. Buchan & Co., 6 houses and 4 garages, on site adjoining 181 New Park Road, Streatham; Messrs. Wates, Ltd., 2 shops and 5 houses, Streatham Vale, Streatham; Mr. H. Banks, petrol filling station and lock-up garages, Upper Richmond Road, Southfield; Messrs. Holliday & Greenwood, Ltd., new L.C.C. school, Magdalen Road, Springfield.

WANDSWORTH.—The B.C. have passed plans for the following: Mr. J. S. Watkins, erection of Church on site at rear of premises in Balham High Road and Elmfield Road, Balham; Messrs. Harbrow, Ltd., erection of a lecture hall, at rear of 19 Streatham Common North.

WANDSWORTH.—The B.C. propose to erect 80 non-parlour houses on the Furzedown Estate, at a cost of £42,960. When these contracts are completed, the Council will have erected 1,065 houses.

WELWYN GARDEN CITY.—The Herts E.C. propose erecting a school in the Pear Tree district.

WOLVERHAMPTON.—Sanction has been received from the B.E. to the proposal of Wolverhampton and Staffordshire authorities to proceed with the scheme of completing the Technical College in Wulfruna Street. The cost of the other sections to complete the college buildings is estimated at £112,614.

WOLVERHAMPTON.—The Wolverhampton E.C. recently adopted a scheme for the erection of temporary buildings to cost £1,500, and a permanent school block to cost about £15,000, to be proceeded with simultaneously. The latter will be on semi-open air lines.

YEovil.—Yeovil T.C. recently embarked on the largest of the many housing schemes they have undertaken. This provides for the erection of 296 houses on the Preston Road, at a cost of approximately £135,000. The scheme is divided into two sections, the first consisting of 60 houses, of an area of 905 feet, and it is proposed that these shall be sold after erection. The tender of a Wolverhampton firm, amounting to £29,400, was accepted. Section two consists of 236 houses, ranging from an area of 892 feet to flats of an area of 572, and the accepted tender amounted to £102,818.

YORK.—Alterations are to be made to the Coach and Horses Hotel, Jubbergate, York, at a cost of £1,000. The North Riding of Yorks C.C. has decided to build a new registry of deeds office, at a cost of £10,000.

TANFIELD.—January 31.—For the erection of 66 houses on the above site, as follows:—14 semi-detached type B.3 houses; 30 semi-detached type B.2 houses; 22 semi-detached type A.2 houses. Mr. J. R. Heslop, P.A.S.I., Council Offices, Tanfield. Deposit £2 2s.

TOTTENHAM.—January 27.—For the erection of a superintendent's house and offices at Tottenham Cemetery, for the Tottenham and Wood Green Burial Board. Mr. J. C. S. Mummery, F.R.I.B.A., Bloomsbury Square, W.C.1.

WELWYN.—For the erection of a classroom wing at the Welwyn Church of England Schools. Messrs. Barker & Kirk, architects, 11 Buckingham Street, Strand, W.C.2. Deposit £1 1s.

WORCESTER.—January 24.—for the erection of 64 three-bedroomed type houses on the Checketts Lane and Droitwich Road site; the erection of 38 two-bedroomed type houses on the Checketts Lane and Droitwich Road site; the erection of 16 parlour type houses on the same site; the erection of 4 parlour type houses on the Lechmere Crescent site; and for the construction of roads and sewers on the Checketts Lane and Droitwich Road sites, for the City Council. The City Surveyor, Mr. William Ransom, M.I.C.E., Guildhall, Worcester.

MESSRS. BOURNE & HOLLINGSWORTH'S RE-BUILDING SCHEME, OXFORD STREET, W.
Architects: SLATER & MOBERLY, F.F.R.I.B.A. *Contractors:* F. G. MINTER, LTD.
 The new building will contain over 27,000 superficial feet of HY-RIB.

HY-RIB

for Plaster and Concrete Work.

HY-RIB FOR SUSPENDED CEILINGS

Hy-Rib as used in ceilings largely dispenses with the small channels, T's, angles and joists necessary where the ordinary type of lath is used, because the ribs of Hy-Rib give the necessary stiffness and rigidity. In this way the great expense of wiring lath to a large number of separate channels is much reduced.

Hy-Rib is placed with the lath surface downwards, providing a perfect key for plastering, and does not require more than a minimum amount of material.

Hy-Rib can be used in the construction of both flat and curved ceilings. In the case of the latter, the curving being done at our works eliminates expensive labour on the site.

Hy-Rib sheets are supported at about 4 or 5 ft. centres either directly from the construction above or by means of lines of flats, ceiling joists, channels, or angles.

Hy-Rib for ceilings saves time and labour in installation, and its initial cost is lower than would be the case if ordinary metal laths were used. Those builders who have experienced the difficulties of erecting ordinary lath and of straightening it out will best appreciate the advantages of Hy-Rib, which is delivered in rigid sheets.

HY-RIB IS THE PERFECT BASE FOR PLASTER AND CONCRETE

The whole of the suspended ceilings in the re-building scheme of MESSRS. BOURNE & HOLLINGSWORTH, LTD., are being constructed with Hy-Rib. False beams, cornices, and screens for the fireproof doors in Hy-Rib construction are also included in the scheme. Special concrete slab ceilings, forming an important part of the ventilating system, have been reinforced and centred with Hy-Rib, so that hardly any timber falsework was necessary.

THE TRUSSED CONCRETE STEEL CO. LTD.

Building Wages

At a recent meeting of the National Joint Council for the Building Industry, the recommendations of the grading commission of the council were approved without amendment. The result will be to raise the wage rates of craftsmen in 14 localities by ½d. an hour, and to add from ¼d. to ¾d. an hour to the rates of labourers in those areas. In all these cases the re-gradings were upwards, and the places affected are: Leamington, Warwick, and Swadlincote, in the Midland region; Southampton, Eastleigh and Folkestone, in the Southern Counties region; Norwich and Brentwood, in the Eastern Counties region; Cheltenham and Gloucester, in the South-western region; and Kendal, Windermere, Ambleside, Keswick, and Penrith, in the North-western region. Among these, Swadlincote is raised to the highest grade outside London, giving rates of 1s. 8d. an hour to craftsmen and 1s. 3½d. to labourers. The following places were graded for the first time, and the craftsmen's rates appropriate to their grades are shown in parentheses: Teignmouth (1s. 6d.), Minehead and Bovey Tracey (1s. 5d.), Salisbury and Salisbury Plain (1s. 4½d.), Truro (1s. 4d.).

Manchester Repertory Theatre

A representative committee in Manchester is to consider the possibility of establishing a Repertory Theatre in the city on the lines of those in Birmingham and Liverpool. A capital of £60,000 is stated.

New Canadian Hotel

The Officer-in-Charge of His Majesty's Trade Commissioner's Office at Toronto reports that it is proposed to erect in a Canadian city, early this year, an hotel at an estimated cost of 5,000,000 dollars. The building will be 19 storeys high, and will contain 540 rooms, as well as a ballroom. Further details as to the names of the promoters and of the architects, to whom it is suggested communications in regard to the supply of hotel equipment, etc., should be addressed, may be obtained by United Kingdom manufacturers and exporters on application to the Department of Overseas Trade. At the same time, His Majesty's Trade Commissioner's Office at Toronto reports that an apartment hotel is to be erected locally in the near future, at an estimated cost of 2,500,000 dollars. It is anticipated that work on the building, which is scheduled to be completed by October 1, will be commenced this month. The architect for the building has informed the Officer-in-Charge that he will be pleased to receive particulars from United Kingdom firms in a position to supply equipment entering into the construction of a modern apartment building. He would particularly like to hear from firms interested in the supply of tiling and sanitary equipment. United Kingdom firms in a position to offer British materials and equipment can obtain further particulars, including the name and address of the architect referred to, on application to the Department of Overseas Trade, quoting the reference C.X. 2169.

New Technical College in South Africa

H.M. Senior Trade Commissioner in South Africa reports that the Council of a South African technical college are proposing to erect new college buildings at an estimated cost of £50,000. No information is at the moment available as to the name of the architect appointed in connection with the scheme, but H.M. Senior Trade Commissioner suggests that interested United Kingdom firms who may be desirous of quoting for any of the fittings, furnishings, etc., likely to be required should forward copies of their catalogues and price lists to the college authorities. Firms in a position to offer British materials, etc., can obtain the address of the Principal of the College referred to on application to the Department of Overseas Trade, 35 Old Queen Street, London, S.W.1 (quoting Reference C.X.2161).

Building Apprentices

Members of the north-western branch of the Building Trade Employers' and Operatives' Federation met at Manchester Town Hall recently, at the invitation of the Building Industry Committee, set up recently by the Ministry of Health. It is understood that the question of increasing the number of craftsmen by the introduction of apprentices was discussed.

Steel versus Sand

Two cylinders of concrete were mixed and matured for independent test. The difference between these cylinders was in the aggregate—one was Sand, the other Betonac, the new metallic aggregate.

Exposure to a 15ft. head of water saturated the sand concrete within 310 hours, but the Betonac Steel Concrete remained waterproof throughout the test.

"To make the surface waterproof, use Betonac."

Samples and National Physical Laboratory report upon request.

BETONAC

STEEL CONCRETE

FRANCOIS CEMENTATION COMPANY, LTD
Betonac Department, 5a, Bentley Works, Doncaster.

It is possible to produce a cement stronger than "Kaye's" and Cement, we shall be the first to make it. Are you using "Kaye's," one of the oldest and best Portland Cements?

KAYE'S

PORTLAND CEMENT

Builders requiring an efficient binding material which costs less than Portland Cement, we recommend "Kaye's" BLUE LIAS LIME, prepared from the beds of the Lower Lias formation. Write to:—

WROUGHT STEEL VENTILATORS

YEARS of experience in the manufacture of Ventilators made from Wrought Steel have resulted in many and important improvements being effected, chief of which is increased capacity for the free transmission of air. We have reduced the area of fretwork obstruction and thereby largely increased the size of openings in our Ventilator faces, with added strength.

The air capacity of H. & C. faces will be supplied on request, together with sizes of Ventilators stocked. Made of heavy gauge steel to ensure rigidity and durability. Of all Ironmongers and Builders' Merchants.

Wm. E. PECK & CO. of London Inc.,
31, Bartholomew Close, LONDON, E.C.1

CURRENT MEASURED RATES.

[COPYRIGHT.]

These Prices apply to a New Building, costing from £1,000 upwards, in the London Area.
They hold 10 per cent. in excess of the actual prime cost, without Establishment Charges.

PRELIMINARIES.

BLUE CIRCLE

FREE TECHNICAL SERVICE

Highly trained concrete engineers are at the service of all users of Blue Circle Cement. This service is *entirely free*.

These experts are ready to answer questions by correspondence or will act as advisors on the use of Cement for any important job, visiting any part of the country, without obligation or expense to the user.

This is but one of the special free services always available to users of Blue Circle Cement—the cement that exceeds all the demands of British Standard Specification.

THE CEMENT MARKETING COMPANY LTD.,

Selling Organization of The Associated Portland Cement Manufacturers Ltd., The British Portland Cement Manufacturers Ltd.,

Portland House, Tothill Street, Westminster, S.W.1.

BUILDING WAGE GRADES

Grade Classification	A	A1	A2	A3	B	B1	B2	B3	C	C1
Standard Rates	1/8	1/7½	1/7	1/6½	1/6	1/5½	1/5	1/4½	1/4	1/3½
Labourers' Rates	1/3½	1/2½	1/2½	1/2	1/1½	1/1½	1/1	1/0½	1/0½	-(1/11)

The following are the gradings of towns in England and Wales. The rates quoted apply to all craftsmen, with the exception of those marked with an asterisk, which denotes that there is a differentiation in the rate paid to painters, details of which are given separately at foot. The London rates are :—Within a 12 mile radius from Charing Cross—all craftsmen (excluding painters), 1s. 9½d.; painters, 1s. 8½d.; labourers, 1s. 4½d. From 12 to 15 mile radius, all craftsmen (excluding painters), 1s. 9d.; painters, 1s. 8d.; labourers, 1s. 4d.

THIS IS AN ABRIDGED LIST; THE GRADINGS OF OTHER TOWNS MAY BE HAD ON APPLICATION TO THE EDITORIAL OFFICE OF THIS PAPER.

THE GROWTH OF A CIVIC SPIRIT

Judging from recent reports in *The Manchester Guardian*, Manchester citizens are beginning to think that their City might be improved, architecturally. At the Dinner of the Manchester Society of Architects last week, the Lord Mayor of Manchester pointed out, as evidence of the fact, that the plans for a new commercial property in Piccadilly had been turned down by the Corporation as unsuitable for the proposed site. In particular, as we chronicled at the time, the building would have been less than half the height of those around it. In a subsequent interview, his Lordship admitted that "Manchester leaves a lot to be desired from an architectural point of view." He was extolling the idea of forming a Civic Committee of Public Taste, a project which has long been talked about by Manchester people; but now seems to have received a fresh impetus through the action of the Civic Committee of the Royal Manchester Institution, which in conjunction with the Parks Committee of the Corporation, has secured a suitable lay-out for a triangular piece of ground outside East Didsbury railway station, where Kingsway begins, constituting the southern entrance, as it were, to the City. This is but a single instance of the civic spirit, which is, however, apparently largely permeating public feeling in Manchester, and the ranks of the Corporation as much as the private citizens. The civic authorities have not sufficiently wide powers at the moment to do all that they could wish, but they hope that the present Corporation Bill before Parliament will give them power to do more in this direction. The small Committee of the Manchester Institution is not, of course, sufficiently representative or influential to have its views generally accepted on any question of civic amenities that may arise; but if its efforts result, as happily, it seems they may do, in the constitution of an authoritative Committee of Taste, whose views will necessarily command the attention and co-operation of the citizens, then its labours in the cause of a civic conscience will have been crowned with success. It is becoming more and more evident in our crowded islands that the old doctrine of individualism and *laissez faire* in matters of building and town-planning must go by the board; unless present and future generations are to be burdened with the results of errors, as grievous as those which the sins of our forefathers have laid upon us. It is idle to contend that the jerry-built slums and narrow,

tortuous streets, which their methods of building development have left us, do not exact a heavy penalty in impaired health, enfeebled constitutions, zymotic disease, financial loss and daily inconvenience, that could have been largely avoided had wiser counsels and a far-seeing civic spirit prevailed in the past. Apart too, from material considerations, such as these, of sound sanitary construction and convenience, we cannot, when doctors, sociologists and psychologists are continually harping on the effects of environment, neglect the more artistic aspect of building or the amenities in our cities.

The new attitude towards civic amenities, which Manchester is adopting, is one to be heartily encouraged and assisted; and the speeches at the dinner of the local Society of Architects, showed that that institution, at all events, is both alive to the possibilities and willing to lend its aid in the work.

The Edinburgh Corporation has already set an example by including in its new Act a clause giving power to the Dean of Guild Court, the local building tribunal, to order alterations in the elevation or design or materials of buildings if they think it necessary or expedient. Bath already possesses power to control building in its area; and Oxford has taken action upon the same line. Of other developing communities, Nottingham occurs to us as a city which is greatly in need of wider controlling powers. On account perhaps of the decline in the lace trade, and the failure of the cycle boom, it has developed rather more slowly than many other industrial towns. Many years ago, it laid out some fine boulevards, and converted the old Central race-course into a public recreation ground; at a later date the Great Central Railway cut through the heart of the worst slum district; and, more recently, the public spirit of one of its citizens, Sir Jesse Boot, has endowed it with a magnificent waterside promenade, gardens, recreation grounds, and new University buildings. A fine block of new Municipal buildings has also been embarked upon in the historic market place. In many ways, Nottingham is singularly blessed from a civic point of view; but it still possesses numerous unlovely streets and unless, in view of the present rapid extension, the Corporation possesses powers to control the quality as well as the quantity of the development, we fear that the present bright promise may not come to its due fulfilment in the fine City which might so easily be secured.

Notes and Comments

The Repair of Churches

We are so accustomed to hearing that some architecturally famous or favoured Church, or ancient building, has suddenly developed grave defects, which a large sum is needed to remedy, and is so difficult to raise, that the plan adopted by the Vicar and Churchwardens of Eling, in Hants, to meet or forestall such a contingency comes as something of a surprise; surprise, that is, that it is not more widely known and adopted by the custodians of similar buildings. Briefly, then, the vicar and his coadjutors at Eling have taken out an endowment insurance policy for the benefit of their interesting Church, and by the payment of a comparatively small annual premium, they are assured at the end of 40 years of the sum of £1,000 for a thorough structural overhaul. As the Vicar points out, in a letter to *The Times*, forty years may be a big slice out of the lives of an incumbent and his churchwardens, but it is a comparatively short period in the life of a church; and the acquisition of a large sum in this way means that ample funds are available at regular intervals for repairs that may be needed. No doubt richer communities could pay a larger premium to secure a larger sum or obtain it in less time. This method of providing for the inevitable rainy day is well worthy of consideration by other church custodians. The Vicar of Eling rightly claims that it exacts a small provision from each successive year of worshippers towards the upkeep of the building, instead of throwing the whole accumulated burden of dilapidation on those of a single year.

Clifford's Inn

It will come as a shock to most lovers of Old London that Clifford's Inn, that interesting survival of old houses and cobbled pavements behind the buildings at the corner of Chancery Lane and Fleet Street, London, has been sold and that its days are numbered. True its immediate demolition is not proposed, and, probably, Londoners will be able to visit this haunt of ancient peace for another seven years, when some existing leases will expire. The property, until some years ago, formed a trust for the benefit of poor law students; but, either because of the rise in rents beyond the means of the intended beneficiaries, or for some other exiguous reason, the trust was indicted before the Judicial Bench, which decided that the objects of the charity were not being properly effected by letting the houses as flats and offices, and ordered the Inn to be sold, the proceeds to be invested. It is doubtful whether the poor students benefitted much by this decision, for the late William Willett secured the property at auction for a surprisingly small figure, and it has since been advertised by his firm for re-sale for a good many years past. The new owners are Messrs. Eyre & Spottiswoode, the King's printers, who have purchased the place as a site for their new headquarters. The lease of their present premises in Great New Street, also an interesting old building, is running out, and the terms demanded by the ground landlords for a fresh lease are said to be prohibitive. Though the old Inn must eventually be demolished, it might have fallen into far less discerning hands, and Messrs. Eyre & Spottiswoode have announced their intention of preserving the old Hall.

Flats in Old Houses

The scheme for Swakeleys, near Uxbridge, to which we referred last week, is apparently not the only instance in which it is proposed to convert a notable old mansion into flats. Newstead Abbey, Notts, the home of Byron, is to be altered in this way, and the

structural alterations required to effect this are said to be negligible. The idea is not without its critics, the majority of whom seem to be land or estate agents, and one has a suspicion that their views are coloured by considerations that may range beyond the bounds of mere practicability. Necessarily the conversion of mansions such as these into flats must depend, as an economic proposition, very much on the planning of the house in the first instance. Some may lend themselves to easy and inexpensive conversion, while the cost, in other cases, will be found prohibitory. It is pointed out by one estate expert that "the existing building needs to be purchased at a moderate price to enable a conversion to be undertaken on a remunerative basis." But as the alternative to conversion is usually demolition, it would seem that, in most cases, the conditions would ensure a reasonable purchase price. And while conversion may, in some cases, have been considered and rejected by housing authorities, those authorities have to consider the housing requirements of a rather different class of people to those who would, generally speaking, take up residence in a converted mansion. The agents' view is, apparently, that conversion does not yield a very large return. What, however, is an adequate return? We noted, during the past week-end, an advertisement of a non-basement cottage in the Sloane Square district, suitable for a bachelor, with sitting-room, two bedrooms, bathroom and kitchen, for which the modest sum of £800 per annum was being asked.

The Importance of the Flue

A little controversy has arisen recently in *The Times* on the merits or demerits of the flueless house. This appears to be a synonym for the "all-electric" dwelling which has become suddenly popular with housing authorities who run their own public electrical supply works and are in a position to arrange for a cheap supply of current, incidentally hoping, no doubt, to secure that "day-load" which is the beau-ideal of most electrical supply undertakings. The provision of electric fires and cookers naturally does away with the necessity for fireplaces and flues, and so saves money in one direction; but it is the complaint of critics that in doing away with the flues the normal means of ventilating the rooms is also removed, and that families, who close doors and windows to avoid draughts, will be reduced to doing their breathing through air bricks—always presuming that these have been provided. The "flueless house" is, therefore, condemned as unhealthy, and one that should not be tolerated by the Ministry of Health. Whether the suggested provision of air outlets in the ceilings, connecting with ventilating shafts carried through the roof, will meet the case remains to be seen. Usually a system of air inlets and outlets results in a direct draught between the two, and very little ventilation elsewhere; and, probably, because of the draughts, we have found that the grids in most cases are kept shut or pasted over. We doubt whether much can be done in the matter except by education. And, unfortunately, however much doctors may extol the benefits of ventilation and the open bedroom window, they are not conspicuous in practising what they preach. Harley Street has long been notorious in this respect. In another quarter of London, however, where a number of doctors are living close together, we passed ten doctors' houses late one night recently, in which not a single window was open.

Owing to lack of space in the present issue, our second article on "C. F. Annesley Voysey" has been held over.

AERIAL VIEW OF THE SHAKESPEARE MEMORIAL THEATRE PRIOR TO THE FIRE.

[Central Aerophoto Co.]

THE SHAKESPEARE MEMORIAL THEATRE

One of the most interesting architectural competitions of modern times has just been inaugurated, namely, that for the rebuilding of the Shakespeare Memorial Theatre at Stratford-on-Avon. It may be remembered that the old building was destroyed by fire in March, 1926, and the Governors propose to obtain new designs, and to this end they have consulted with the R.I.B.A., who have appointed Mr. Guy Dawber, President of the R.I.B.A., and Mr. Cass Gilbert, President of the National Academy of Design of the U.S.A., to act as *honorary* assessors, and Mr. Robert Atkinson, Director of Education for "The Architectural Association," to act as assessor on their behalf. It is a happy inspiration on the part of the R.I.B.A. to appoint an American representative on the board of assessors, as Stratford-on-Avon is a favourite place of pilgrimage for Americans, and it is quite likely that a certain number of American architects will be moved to enter for the competition. In this instance the competition will be in two rounds, the first for sketch designs only, followed by a second or final competition limited to six designs selected by the assessors from amongst the preliminary competitors. As it is the object of the promoters to obtain a notable building, "simple, beautiful, convenient—a monument worthy of its purpose," architects have a unique opportunity to show what can be accomplished in the design of a small compact theatre capable of accommodating several styles of play. The conditions have been laid down as a guide rather than a definite statement of requirements, and competitors will be at liberty to vary them within reasonable limits to suit any ideas on the subject of theatre planning which they wish to express.

The fire which destroyed the theatre fortunately spared the library and museum, which building was connected to the theatre by a bridge. It is part of the problem for competitors to retain this building. It may be connected, as before, by a bridge to the theatre, or it may be treated as an isolated block, or the external elevations may be modified as desired. The old theatre building was completely gutted, only the outer walls remaining; these may be incorporated into the new scheme or not at the discretion of the competitors, who may treat them externally as desired. It is improbable, however, that the temptation to preserve the fabric of the old building will prove a strong one. A glance at the photographs here illustrated show that the former theatre consisted of a conglomeration of parts in which variety was more conspicuous than harmony. Brickwork in the Italian Gothic style, little turrets suggestive of a Scottish manse, and Elizabethan half-timber work contributed to a medley which was remarkable even for the Victorian age. It is interesting to note that the old theatre was the result of a public architectural competition in 1877. The Stratford-on-Avon Town Council have agreed to allow part of the adjoining public gardens to be used for the new theatre. It is suggested that the old building, with part of its stage, be reconstructed as a Conference Hall and that the stage of the new theatre shall be built adjoining the stage of the old.

Sweeping public improvements are proposed to the roads north of the gardens, including a new main road and bridge. Competitors would do well to give due consideration to a town-planning scheme now before

SHAKESPEARE MEMORIAL THEATRE AS EXISTING: VIEW LOOKING SOUTH-WEST SHOWING PART OF GARDENS TO BE INCORPORATED IN THE SITE AND BACK STAGE WALL OF THE OLD THEATRE.

the Stratford Town Council, which involves the sweeping away of the sheds and warehouses surrounding the canal basin and the approaches to the new bridge across the river. It is proposed to build a new bridge and thus create a first-class traffic entrance into Stratford from the Oxford and London roads, thus preserving the old Clopton Bridge intact.

The photographs show the extraordinary natural beauty of the environment in which the new theatre is to be placed. It is noteworthy that Canal Basin must be retained and may be utilised as an ornamental pool. It is also suggested that a bridge might be built across this basin, thus affording a first-class roadway access to the theatre.

While the competitors are invited to exercise their imagination with regard to the scheme, some very precise requirements are specified in the conditions. This is as it should be, because the task of design is always rendered more agreeable when the architectural "programme" is defined as clearly as possible. Within certain obvious limits it is true to say that the more complex the "programme" the more interesting is its solution and the greater is the stimulus to artistic creation which is afforded by it. The competitors will naturally welcome the condition that "the auditorium should be simple, and any decorations should direct the eye towards the stage, the essential feature being that each seat should have a clear view of the stage." The capacity of the theatre is to be 1,000, and a two-tier house is favoured rather than a three-tier house. A few boxes are to be provided, including a Royal box with ante-room. The audi-

torium is required to have either a glazed sliding roof or other means to illuminate with sunlight and ventilate the interior. In fact, it is true to say that the conditions have been drawn up with quite exceptional thoroughness and every effort is made that the competitors shall not be left in the dark with regard to any of the practical requirements considered essential by the assessors. For instance, it is decreed that the seats should be not less than 33 ins. by 20 ins., gangways should be at least 3 ft. 6 ins. wide, and there should be not more than thirteen seats between gangways and there must be ample gangways at the rear of the seats, the sight line from the back of the ground floor of the auditorium must include 18 ft. in height of the proscenium curtain, while the sight line of the highest seat of the balcony must include 10 ft. in height of the back cloth of the stage.

Three main styles of play must be catered for, and these require for their presentation: (1) The normal picture stage, (2) the Elizabethan or "apron" stage, and (3) the Greek stage. As far as it is humanly possible, the new theatre must be adequate to the presentation of Shakespeare in any fashion which later generations may approve. It is suggested, there-

fore, that as it may be necessary occasionally to build out the stage into the auditorium for apron stage performances, all sight lines must include not only the footlights in their normal position, but also a space at least 12 ft. in front of the proscenium opening. It is further required that no seat must be nearer to the proscenium than 16 ft. or further from it than 75 ft., and that the flooring of the parterre be at no point more than

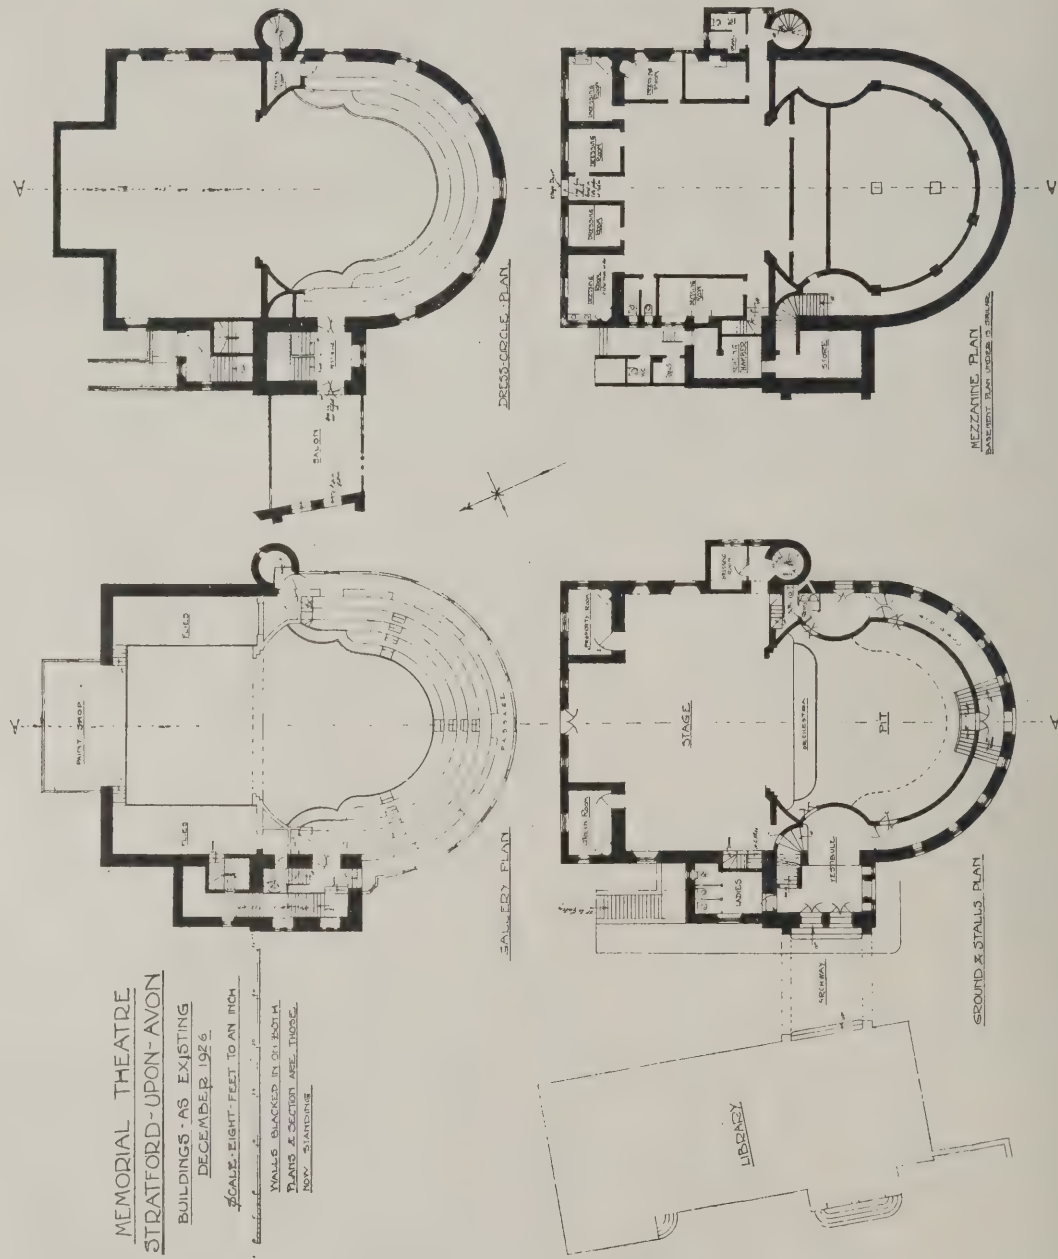

THE CANAL BASIN.

3 ft. below the level of the stage. For the "picture stage" the normal and permanent apron projects 4 ft. over the orchestra, which must be sunk 8 ft. below the level of the stage and 5 ft. below the level of the floor of the parterre; for the Elizabethan stage the apron is temporarily extended by removable staging over the orchestra, giving a fore-stage 12 ft. deep; while for the Greek stage the orchestra rail is removed, and the orchestra well is covered with temporary staging at the level of the parterre floor, and steps and temporary fronting are fitted between the two levels of the stage.

It is, of course, recommended that the stage be made adequate for handling any production with ease and rapidity. This is all the more necessary as in the season the policy of the Governors is to produce as many as eight different plays in a week. While a wide proscenium is not desirable, a wide stage is and should be 50 ft. in depth with as much width as possible. The stage needs to be flat, not raked, while its centre portion must be built in sections.

Most competitors would wish that the requirements might end here. Let the conditions for the auditorium be as complex as desired, it is at least one chamber susceptible of a dignified architectural treatment. But it is when they get outside the auditorium that the trouble begins. The demands for miscellaneous accommodation outside the auditorium have grown inordinately in recent years, and the satisfaction of these demands is becoming increasingly more difficult without spoiling the elevations of a theatre or play-house. Are all these necessary small rooms to be placed round the building so that the noble auditorium will be swathed by them as by a blanket? Must the fenestration of all these small rooms give the tone and character to the whole edifice, or will some means be found to enable the auditorium itself to appear architecturally more important than the hundred-and-one little apartments which are subordinate to it? These and other questions the competitors will doubtless decide for themselves. As far as the inside of the theatre is concerned, not much latitude is given them. The determining factors of plan and section have been admirably defined in the conditions. After all, in essentials the problem of theatre design for our modern stage has been solved years ago. The actors act on a three-wall stage, and the audience gets as close to this stage as it conveniently can. One or more tiers of seats on a slight slope, perhaps on the horseshoe plan for the galleries, is a comfortable arrangement and one which can be made exceedingly elegant. It is externally that the problem presented is one of very great difficulty and will tax the ingenuity of the competitors to the utmost. The easiest type of theatre to design is a single-fronted theatre, a town theatre with no visible backs, or perhaps besides the front only a side elevation in a narrow lane, where nobody expects to find a dignified architectural treatment. But to design a theatre with all four sides exposed is by no means easy. In this instance the assessors affirm that "the style of the theatre may be any style which will harmonise with the spirit of the building and the architecture of the town of Stratford." Those competitors who have no opportunity of visiting the town itself can scarcely do better than study the admirable official survey of the town prepared a few years ago by Professors Patrick and Lascelles Abercrombie and published by the Liverpool University Press, in which these distinguished authors give an exhaustive account of the history and architectural traditions of Stratford-on-Avon, with many fine illustrations, in which town there is to be found, besides charming examples of Elizabethan style, a great deal of excellent 18th century urban building.

Coming Events

Hampshire Architectural Association.—Friday, January 28.—Council Meeting.

Institution of Municipal and County Engineers.—Saturday, January 29.—South Midland District Meeting, to be held at Dunstable.

Royal Institute of British Architects.—Monday, January 31. — Professor Hubert Worthington, A.R.I.B.A., will deliver the Annual Address to architectural students, which will be followed by the Presentation of Prizes and Studentships for the year, by the President, Mr. E. Guy Dawber, F.S.A., 9 Conduit Street. 8.30 p.m.

The College of Estate Management.—Monday, January 31.—Mr. Sydney A. Smith, F.S.I., on "Valuations of Shops, Factories and Flats." 35, Lincoln's Inn Fields, W.C.2. 5.30 p.m.

University of London.—Tuesday, February 1.—Dr. E. G. Richardson on "Acoustics of Buildings." Entrance, Physic Theatre, Gower Street. 5.30 p.m.

Bristol Association of Building Trades Employers.—Tuesday, February 1.—Annual Banquet. The Royal Hotel, Bristol.

Incorporated Institute of British Decorators.—Wednesday, February 2.—Mr. Z. Carr, F.I.B.D., on "Marbling as a Basis for Broken Colour Effects." Painters' Hall, Little Trinity Lane. 8 p.m.

The Institution of Civil Engineers (Students' Meeting).—Wednesday, February 2.—Mr. John Leigh Hunt, B.Sc., on "Escalator Tunnels and other Works at Piccadilly Circus." Great George Street, Westminster, S.W.1. 6.30 p.m.

The Chadwick Trust (Inaugural Bosson Gift Lecture).—Thursday, February 3.—Professor Reilly, F.R.I.B.A., on "Developments in Building Methods." Lecture Room of the Royal Society of Arts, John Street, Adelphi. 8 p.m.

Birmingham Architectural Association.—Friday, February 4.—Students' Evening and Exhibition.

The Bristol Society of Architects.—Friday, February 4.—Annual General Meeting.

The Surveyors' Institution.—Monday, February 7.—Mr. Frank Hunt, C.V.O., on "The Future of London Squares." 12, Great George Street, S.W. 8 p.m.

"Birmingham Gazette" Brighter Homes Exhibition.—Birmingham, February 8-19.—Particulars from Provincial Exhibitions, Ltd., City Hall, Manchester.

The Second Edinburgh Housing and Building Exhibition will be held at Waverley Market, Edinburgh, from February 9 to 19, 1927. Plans and details from: Mr. T. Percy Bentley, Exhibition Offices, 7 Waverley Market, Edinburgh.

Manchester Building Trades' Exhibition.—March 29-April 9.—Particulars from Provincial Exhibitions, Ltd., City Hall, Manchester.

The Liverpool Architectural Society

The Third Special General Meeting was held on January 26, 1927, at the Society's Rooms, 13 Harrington Street. The following elections were made: Fellows—Kenmure Kinna, A.R.I.B.A., Philip Hugh Lawson, F.S.A., A.R.I.B.A., Joseph Pearce Pearce, F.R.I.B.A., John Edward Rowlands, M.S.A.; Associates—Andrew Charles Burrows, Alexander John Davidson, Bevis Alexander Sumner.

Mrs. H. Austen Hall

We regret to record the death of Mrs. H. Austen Hall, wife of Mr. H. Austen Hall, F.R.I.B.A., on January 20. Mrs. Hall was well known to a large circle of friends in the architectural world, whose sincere sympathy will be with her husband in this sad bereavement.

THE TWENTIETH CENTURY HOUSE

IV.—The *Æsthetics* of Hygiene

By A. TRYSTAN EDWARDS.

The "Recess" is equally capable of being adapted for the façades of houses both large and small, urban or suburban, detached or in continuous formation. Some of the most interesting problems of design in connection with the recess will be found to arise in long façades where there is an opportunity of showing how different types of recess can be harmonised both with each other and with different types of fenestration. Before studying examples appertaining to the "individualistic" style of house, I propose, therefore, to put before the reader a few diagrams having as their sole object the determining of a few of the possible elevational treatments of recess, and when once these main types have been established, their application to all manner of buildings will be a comparatively easy matter.

In the last chapter I showed eight examples of the recess on plan. Let us now consider how some of these recesses might appear on elevation. There is not the slightest need to draw even a tithe of the examples which the imagination may construct. Like every other architectural feature, the recess may be badly designed, and I do not propose to put before the reader illustrations of what the recess ought *not* to be. It may be worth while, however, to state that the recess if left open, that is to say, if not bridged by bands of wallage corresponding to the intervals between the windows on either side of it, will assume the guise of an ugly vertical slit in the wall, unless it be of fairly broad proportion. Thus, while the "bridged" recess may be of almost any width, what I describe as the "open" recess must not be too narrow, for otherwise the aperture will seem to have an inhuman dimension and will fail to take its place as a unit belonging to the system of fenestration. It is essential that this proper relationship of the recess to the windows be established, for otherwise the recess will seem an utterly barbaric feature, perhaps even more offensive than the disarray of sanitary pipes it is designed to conceal. The too narrow open recess only displays its true deformity when looked at in perspective. When we see it in full elevation the windows belonging to several storeys are plainly visible, and thus the floor levels find expression on the façade, but a view from an oblique angle is apt to show nothing but the one large aperture, a vertical slit of which the back wall is invisible. A recess consisting of only one water closet might be an "open" one if it consisted on only one floor, but if it extended to two or more floors it would obviously

give offence in the manner I have just indicated. A recess showing a double window or two windows belonging either to two closets, a closet and corridor, or a closet and bathroom, is easier to treat, but even here it is questionable whether a cavity of such small horizontal dimension should be allowed to remain open, unless it is not considered an integral and subordinate part of the façade but merely a *dividing* member between two separate façades. In such an instance the "slit" would have a definite æsthetic function and would thus appear justifiable. If two adjacent houses facing a common thoroughfare share a recess between them, this recess might legitimately assume the form of an open slit if the general composition of the group is not impaired thereby. A pair of houses with a slit dividing them would, of course, not be such an agreeable composition as three houses divided by two of these narrow recesses, because in the latter instance the group would have a measure of unity lacking in the former. Otherwise, where the recess is narrow, it should in all cases be bridged, so that from all points of view the division of the building into several storeys finds obvious expression.

The wider the recess becomes in relation to its height and the shallower it is, the more justification is there for leaving the recess "open"; for even if seen in oblique perspective the floor levels are indicated in the fenestration of the recess. Thus the argument has so far brought us to the conclusion that while the "broad" recess may legitimately be "open," the narrow should be "bridged."

Fig. 13 shows two varieties of recess, both "open," and in between them is fenestration of the ordinary kind. This is merely a diagram, the windows being shown in outline only, but it may serve to illustrate a certain æsthetic quality of the recess, namely, its power to give rhythm to a façade by constituting a repetitive feature which may break up the long horizontal lines in an agreeable manner. It is easy to imagine that long terraces or imposing blocks of flats in a metropolitan or urban environment are rendered more interesting in elevation by being provided with recesses at definite intervals. By such an arrangement a feature in its origin utilitarian is made to serve an æsthetic purpose and elements of building which, as usually treated, are nothing but an eye-sore become in the truest sense of the word decorative and contribute to the dignity of architecture. Moreover, by means of the recess the resources of domestic

planning are greatly increased, because the designer no longer finds it incumbent upon himself to try to place the domestic offices away from the street or from public view, for he can put them where he will without fearing that they need become an offence. The outrageous street backs, so often open to the gaze of railway passengers, could all have been made perfectly seemly had their architects been acquainted with the recess.

In Fig. 13 I have shown what is somewhat of a curiosity, namely, a recess within a recess. It is quite possible to conceive of a plan which would justify such an arrangement. For instance, while the interior recess might serve bathrooms and closets, the exterior one might accommodate kitchens, sculleries and orders belonging to flats. In this case the smaller cavity also serves the purpose of giving scale to the larger and brings it into æsthetic relationship with the recesses on either side. I do not here contend that this design is especially meritorious, but it perhaps has a certain interest inasmuch as it shows the "ceremonial" aspects of the recess. Let the reader, however, in imagination strip away the sheltering walls of the recesses and expose the wilderness of sanitary pipes and insignificant tell-tale windows of the smaller domestic offices and consider whether by any other treatment these ugly features could have been as efficiently concealed.

This problem of the proper spiritual status of the recess as an architectural feature is not an easy one, and in Figs. 14 and 15 I have presented a contrast which may throw some light upon it. In Fig. 14 I have taken pains to emphasise the windows of the principal rooms by elaborating them with architraves, moulds, aprons, decorative cills and other ornaments, while the apertures of the recess are kept comparatively plain, with nothing but architraves—which latter features, however, seemed necessary in order to establish some degree of affinity between the ordinary windows and those of the recess; in Fig. 15 I have done just the reverse, and while keeping the ordinary windows plain but for the balcony railings, have used super-imposed orders in the recess, which is thus made a highly self-conscious architectural feature. It may be argued that in Fig. 15 the windows of the living-room do, in fact, hold their own by virtue of the greater expanse of wallage occupied by them, and that the recess in this instance does not dominate the façade in an unpleasant or inappropriate manner. It is not the object of the recess to glorify bathrooms and water-closets so that they are made to appear the most important elements of domestic architecture. In

Fig. 15

the case of Fig. 15, however, the spectator is not immediately made aware that the recess contains the windows of these apartments; his first impression of the recess is that it is something rather agreeably mysterious, but not pointedly so, and the chances are that he might easily accept it without feeling impelled to analyse its function in detail. If the recess, through frequent use, ever became a familiar feature in domestic architecture, it would indeed symbolise, in the first instance, the domestic offices and, secondly, hygiene in general, and it is this second and more general signification of the recess which would in time be popularly accepted. We are not entitled to make an architectural fuss about water-closets in particular, but we may with perfect propriety create a decorative symbol to express our regard for the principles of hygiene.

Although, however, we are justified in making the recess a pleasant architectural feature, it must not be the *principal* feature in any architectural composition unless it incorporates within itself the principal entrance to the building. Such is the case in Fig. 13, where it is seen that the main doorway is situated in the centre of the large recess. The subordinate recesses on either side, while formally prominent, yet have the character of dividing members, just rhythmical points of interest which serve the function of emphasising the dimensions of the long façade to which they are really subordinate.

New London Hotel

A contract has been placed this week for the new Oddenino's Restaurant in Regent Street, W.1, referred to in THE ARCHITECT & BUILDING NEWS on December 17 last. It is to be of Portland and artificial stone, and will take 16 months to construct. It is to have two main entrances—one from Regent Street and the other from Glasshouse Street—with shops on both frontages. The hotel accommodation will hold, in addition to the ordinary bedroom provision, a series of complete self-contained suites consisting of a bedroom and bathroom and a private sitting-room. All the features of the old Oddenino's will be retained, plans having been made for the inclusion of a big central grill-room, with a lounge and café, and a *brasserie* in the sub-ground floor. The contractors for the new hotel, which will cost £250,000, are Sir Lindsay Parkinson, Ltd., of Blackpool and London. The plans have been prepared by Messrs. Yates, Cook & Darbyshire, 43 Great Marlborough Street, W.1, in conjunction with Mr. T. H. Smith, 17 Basinghall Street, E.C.2.

Fig. 14

LEEDS UNIVERSITY COMPETITION. FIRST PREMIATED DESIGN: PERSPECTIVE SKETCH.
MESSRS. LANCHESTER, LUCAS & LODGE, FF. and A.R.I.B.A., Architects.

THE LEEDS UNIVERSITY COMPETITION

Mr. Percy S. Worthington has given his award in the Leeds Competition. The designs of Messrs. Lanchester, Lucas & Lodge have been chosen, while the second prize has gone to John C. Procter and Joseph Addison, associated architects, of Leeds, and the third to Messrs. Ashley & Newman. This was a limited competition, instituted by the University of Leeds, for the lay-out of the site adjoining Woodhouse Lane, Leeds, for a large number of buildings to be erected thereon. It was also stipulated that the competitors should prepare a supplementary scheme for the remodelling of certain existing buildings which are still useful for University purposes.

The number of students for which it is ultimately intended to provide is 3,000. The new buildings were required to be so planned that they could be built in sections, and so be in part completed to begin with, and added to from time to time as necessary to keep pace with development. The execution of the work will extend over a considerable number of years, but the University propose to proceed at once with work of approximately the value of £350,000, to be expended on those buildings which are most urgently required. Thus the competitors were asked to prepare one of those "piece-meal" schemes which present extraordinarily difficult problems of composition. It is always a difficult task to try to give a part of a group of buildings destined to be built first a preliminary unity, so that they will look quite well by themselves and be yet capable of combining harmoniously with the remaining buildings which are to be added later. Every time the conditions for a great architectural competition are published nowadays, one reads through them with the expectation, not likely to be disappointed, that nearly each clause will be an occasion for some fresh complexity for the luckless competitor, who is seldom asked to tackle a "clean job." In this particular instance one of his problems was to consider the practical limitations imposed by the necessity for the uninterrupted conduct of University work, and of the maintenance of streets and essential services during the periods of transition.

The buildings required to be erected immediately are the library and departments for chemistry, mathematics, mining, physics, arts, engineering and administration. On the other hand, most of the existing buildings containing the arts, science and general

departments are to be retained, and to be adapted for any purposes that the competitors may think fit. Thus it must be borne in mind that the general lay-out is already partly determined by those existing buildings, for the most part abutting on University Road. The textile and leather department, however, which were also required to be retained, must have presented an awkward problem to the designers, who were faced with the alternative of either ignoring them in the general lay-out or of modifying the lay-out to incorporate them in the general scheme. Neither solution is satisfactory, and it is made apparent how extremely difficult it is to rectify a piece of haphazard planning when once the buildings have been erected.

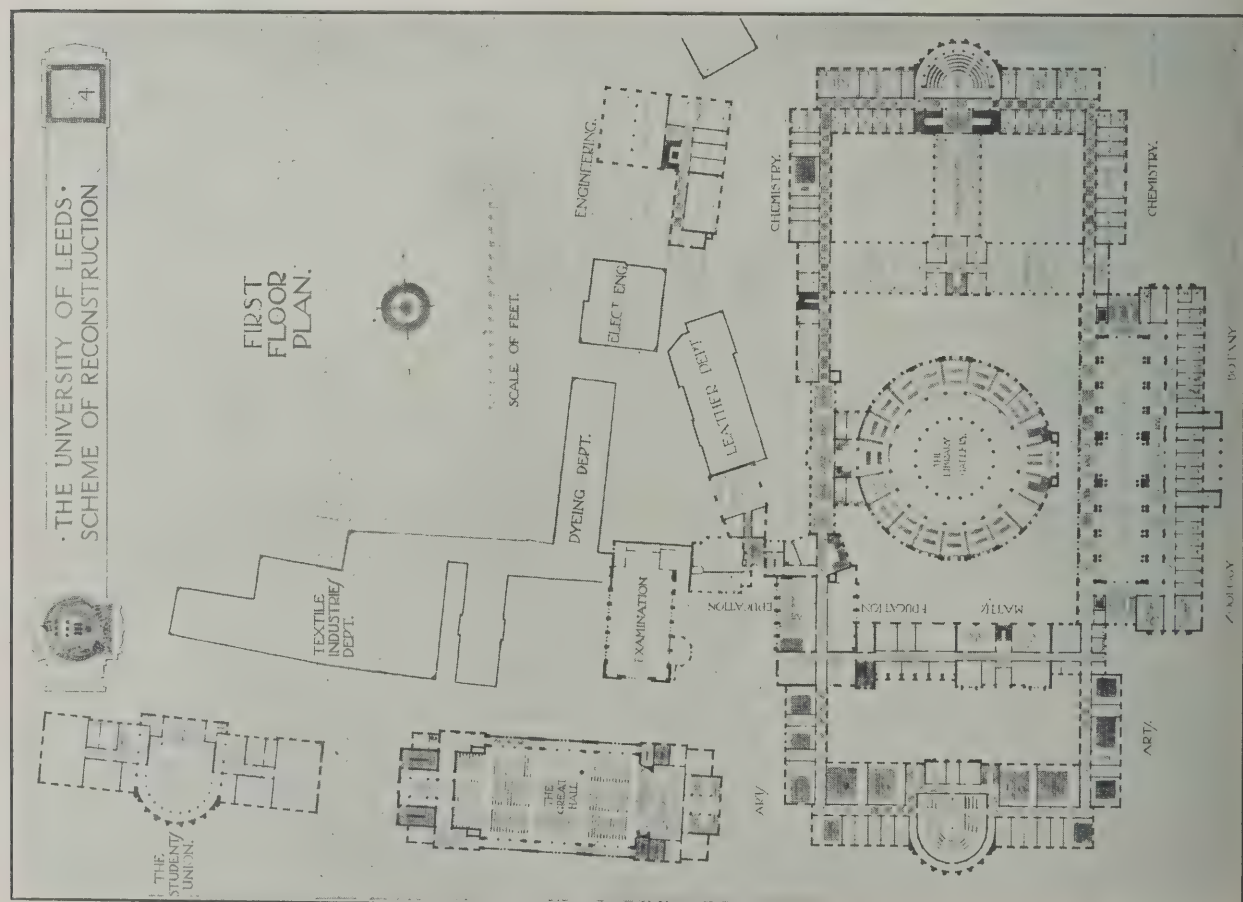

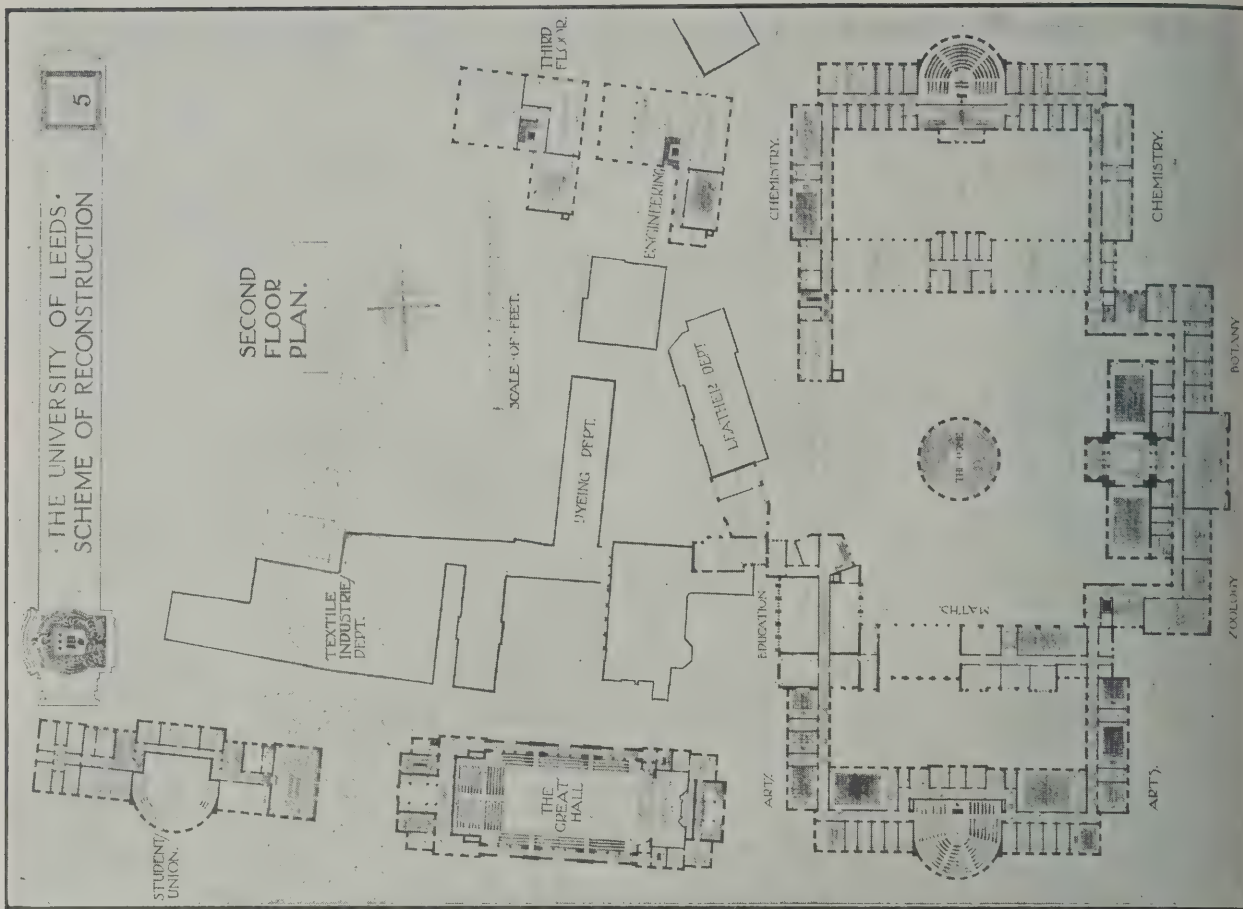

The main approach will be up Woodhouse Lane, from the town. Thus a number of the buildings would abut upon a thoroughfare which is really an arterial route carrying constant and heavy traffic; consequently special care had to be taken in the planning and construction of those departments in which quiet or freedom from vibration was particularly required, all workshops being kept away from main frontages.

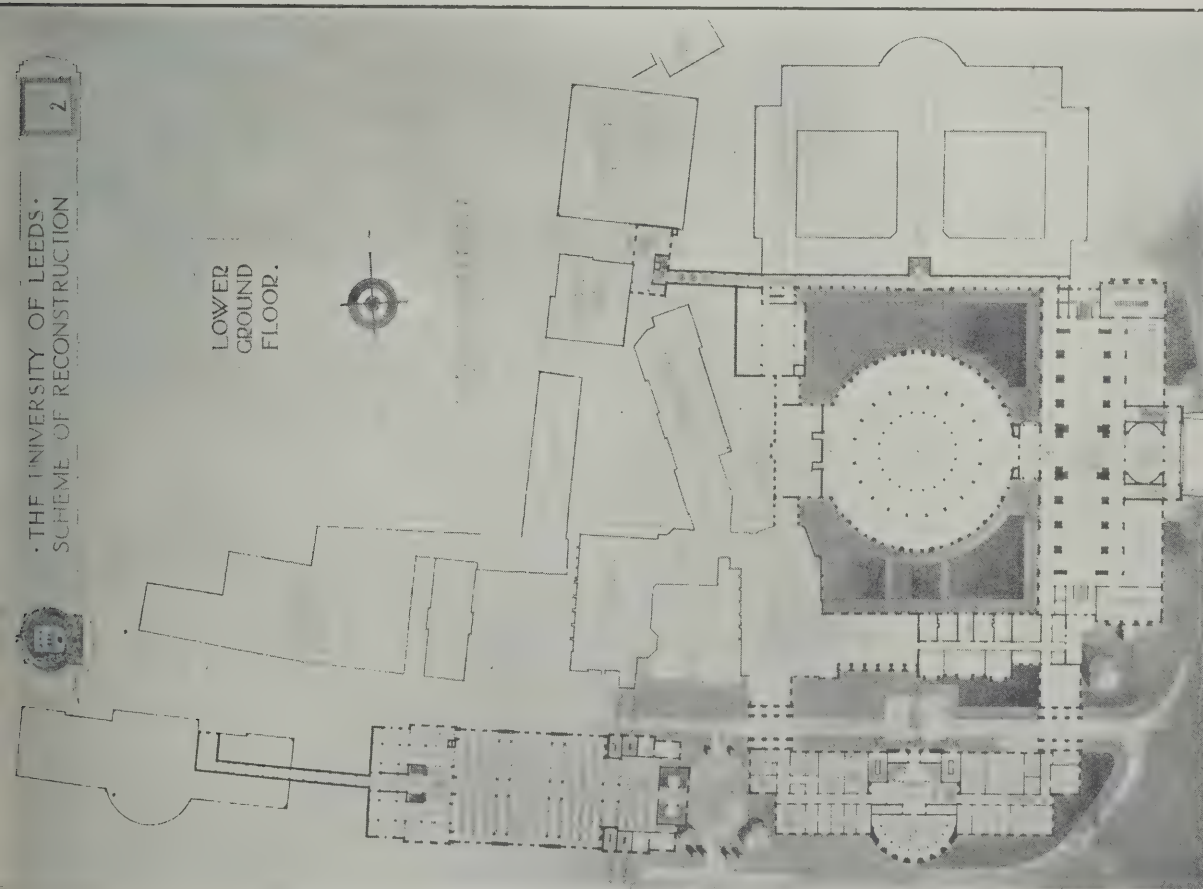

The Assessor suggested that it was not essential for each department to be housed in a separate building. For economy of working they will be grouped together, for instance, zoology and botany, geography and geology, or all four with a central museum. This hint on the Assessor's part has been adopted as a general principle by some of the competitors, but not by others. It is worth while to lay special stress upon this point, because it is of great importance, and its consideration may quite properly form the principal part of our analysis of the designs submitted.

To what extent is the design one whole, one continuous and homogeneous group of buildings? This is the question to which we must address ourselves. The reasons why the buildings should have this unity are both social and æsthetic. The social reason is that the University is one single thing, and this singleness of unity should find architectural expression. Next it must be borne in mind that the bulk of the buildings are being planned simultaneously at the bidding of an authority with comprehensive views, great powers of organisation, backed by financial resources adequate for the attainment of their pur-

LEEDS UNIVERSITY COMPETITION: FIRST PREMIAED DESIGN.
 MESSES. LANCHESTER, LUCAS & LODGE, FF. and A.R.I.B.A., Architects. Perspective by T. H. LODGE, A.R.I.B.A.

LEEDS UNIVERSITY COMPETITION: FIRST PRIZE DESIGN.
MESSRS. LANCHESTER, LUCAS & LODGE, FF. and A.R.I.B.A., Architects.

poses. This unity of aim requires to be translated to a unity of achievement—that is to say, the buildings must in their ensemble have two main characteristics, they must look as if they belonged to each other and as if they were planned simultaneously. What gives dignity to great formal schemes is not only the harmonious inter-relationship between their sub-division, but the impression of great will on the part of the society responsible for their erection.

Of the schemes here submitted, therefore, the most successful architecturally will be those which show the largest possible grouping of the units in a pattern which, though subtle as may be, has yet a certain *obviousness*, so that there can be no possible mistake as to the fact of their conscious arrangement.

Two main types of treatment are here in evidence. Messrs. Lanchester, Lucas & Lodge, Mr. Waterhouse, Messrs. Alban Jones & Stocks, and Mr. Munby, show schemes with a wide symmetrical frontage towards Woodhouse Lane, while Messrs. Procter and Addison and Messrs. Ashley & Newman have corner treatment showing the climax to the composition immediately opposite the approach from Woodhouse Lane as it comes up the hill. Messrs. Ashley & Newman have even taken the bold course of screening all the University buildings behind a grand entrance gateway, which closes the vista as one ascends Woodhouse Lane. Immediately behind the gateway is a large fore-court, giving access to University Road on the left and a new road exactly balancing it on the right, while in front is the main administrative block, which on the ground floor consists chiefly of a great hall communicating with all the departments of the University. Messrs. Ashley & Newman's scheme is the one which appears to provide the greatest measure of unity, both in its formal pattern and in the actual intercommunication between the buildings. In one respect, however, they appear to have departed from the intentions of the originators of the University scheme, which was to make the library the climax of the composition and the principal outward symbol of learning. These architects have given their library a somewhat subordinate place, setting it in a space bounded by three minor roads, though it has its main frontage towards University Road. Its narrow end, however, appears in Cavendish Road, and lends additional dignity to the group composition approached from Woodhouse Lane. There is much to be said for this arrangement, for a library should suggest quietude and a certain detachment, and it is perhaps questionable whether this part of the group is fitted to dominate the whole. It is true, of course, that at Oxford the Ratcliffe Camera is the prominent architectural feature of the city, yet it is detached, arising, as it were, by chance, and thus does not appear to be demanding a headship and priority over the other buildings. It may be argued, of course, that none of the departments of the University has priority over any other, the studies both of the arts and sciences being given a formal equality, and in the library alone do these various intellectual activities have a common meeting place; consequently the library is fitted to be the visible centre and chief symbol of the University. This is the view taken by all the other competitors. Messrs. Lanchester, Lucas and Lodge have placed their library in the centre of a great group of buildings facing Woodhouse Lane, and have crowned it with a dome. This scheme is also largely conceived, and the communications are well arranged. All the main University buildings, with the exception of the Great Hall of the Engineering Department, are grouped in one symmetrical pattern, and it is undoubtedly a very fine composition. The most prominent architectural feature is the great tower over the entrance, slightly reminiscent of the Nebraska State Capitol. It is

noteworthy that elsewhere the design shows American inspiration, namely, in the façade of the Great Hall, which seems a *bijou* edition of the Pennsylvania Railway Station.

The only other scheme placed on a corner axis is that of Messrs. Procter and Addison of Leeds. Here the library is axially placed behind the entrance hall, which is approached by a fine arched doorway with pediment over, in this instance the chief feature of the elevation. The communications are good and seem to have been obtained easily, while all the principal departments are housed in buildings of individual shape and nothing has been sacrificed to formality. Yet the elevations are orderly and have a simplicity and quietness which is pleasing.

Mr. Waterhouse's scheme has a wide symmetrical frontage towards Woodhouse Lane, and shows a fine entrance court, behind which is the library block, the central feature of the composition. On either side of the entrance are the administration block and the department of electrical engineering, and it appears that the resulting symmetry has been attained at the expense of expressiveness, for there is good reason for giving the administration block a formal differentiation from the departments of art or science. The elevational treatment in the courtyard is not altogether satisfactory, the fenestration and cornice lines of the library block ignoring the levels of corresponding features in the buildings on either side of it. The scheme is, however, a practical and economical one.

Mr. Munby has placed an entrance colonnade at the centre of the elevation to Woodhouse Lane, behind which is a fine rectangular courtyard. The library, with dome, occupies the place of honour, and is flanked on either side by low buildings, themselves a part of the library. The administration block is placed at the head of the bend of Woodhouse Lane and closes the vista at this point; this building is thus properly differentiated from the departments of art and science. It cannot be said, however, that the scheme as a whole has the same degree of organic unity which characterises some of the others, for while there is a fine courtyard with buildings grouped round it in a formal manner, this group has not been aesthetically related to the buildings outside it, and there seem to be two rival groups, namely, the courtyard group and the assemblage of buildings on either side of University Road.

Messrs. Alban Jones & Stocks, of Leeds, show a highly interesting scheme. The entrance feature, a stone cupola surmounting an arcaded portico, is of distinguished design. The elevation towards Woodhouse Lane is skilfully treated, for the architects have avoided the error of giving the long façade too pronounced a symmetry. Several of the competitors have ignored the very important fact that this road is sloping, and they have arranged great compositions on an axis which does not permit the buildings on either side of it to have their basements on a level. In such cases it must be confessed that the contour of the ground has not been properly taken into account. There is much to be said, therefore, for the treatment whereby the axis is placed in a line approximately bisecting the angle between University Road and Woodhouse Lane, because it is then possible to avoid attempting the task of obtaining formal symmetry on a long façade which cries aloud for symmetry.

In all the schemes submitted the Classic style has been employed. There is not even a tentative advance towards "modernism" in any of them. Messrs. Ashley & Newman's elevations, with their great Roman arches, have a fine scale, while they have preserved an admirable homogeneity among a large number of different façades. Messrs. Lanchester, Lucas & Lodge design in a suave manner and have no qualms about using the Order for decorative pur-

poses. On the other hand, Mr. Waterhouse is more puritan and eschews columns. The result is that his uniform rows of windows, without the variation of scale such as the Order can supply, become a trifle monotonous. The elevations submitted by Messrs. Procter & Addison, of Leeds, have the merit of directness and simplicity, and a good effect is obtained by formal emphasis at a few well-chosen points.

The spectacular quality of the winning design must undoubtedly have influenced the assessor. It is likely that the University authorities were pleased at the imposing tower, which would be a land-mark visible from all parts of the city. But apart from that, the scheme gives a highly successful solution of the many practical problems formulated in the conditions, and besides fulfilling the utilitarian requirements, it has dignity and inherence. Messrs. Lanchester, Lucas & Lodge are to be heartily congratulated on their success.

Report by the Assessor

(MR. P. S. WORTHINGTON, M.A., Litt.D., F.S.A.,
F.R.I.B.A.)

I have given very careful consideration to each of the seven designs submitted in this competition, and have the honour of reporting as follows:—

It was not to be hoped that any competitor would solve all the problems involved in the planning and the designing of an ideal modern University, but I am of opinion that the author of Design No. 2 comes nearer to attaining the object of this competition than might have been expected, and certainly nearer than

any of the other competitors. The latitude allowed by the instructions has naturally been variously interpreted, but this designer gives substantially what was asked for and avails himself wisely of that latitude.

His conception of a modern University would be unrivalled in this country, and as a building should rank in the first class anywhere.

While it must be recognised that there are evident faults in his detailed planning of certain blocks such as occur in all the other designs in one form or another, these faults are generally such as can be remedied without in any way spoiling the conception as a whole.

The lay-out is incomparably the finest submitted. Most other schemes placed their entrance close to the agreed boundary line at the angle of University Road and Woodhouse Lane with more or less satisfactory result, but this method of approach has in no case resulted in such a fine lay-out as that produced by this author's entrance from a point very little removed from the angle, but facing Woodhouse Lane. Placed in such a way that the building will be seen in impressive and attractive perspective, and be dominated by a fine tower central with the axis of Woodhouse Lane, it will not only be seen from far down that street, but will dominate the neighbourhood and be seen from all directions and symbolise the university.

This arrangement produces the finely balanced rectangular plan which avoids all awkward angles and confused planning.

On the site plan the boundary along Woodhouse Lane is altered from that agreed on with the Corporation, throwing a considerable area into a widened

street. This may give added dignity to the buildings which are well set back within the agreed line, but is only a question of drawing and of indication of the boundary railing. This railing might equally well be on the agreed line and the space inside it paved or grassed.

The author proposes to make University Road private, and to convert Beechgrove Terrace into a continuation of Hillary Place, joining University Road between the Textile and Agriculture buildings. Nearly the whole site of the University is thus brought within a ring fence, and the composition of the buildings facing this road promises to be as interesting as that towards Woodhouse Lane, so that anyone walking round the site will pass one long series of fine buildings giving the idea of a complete homogeneous and dignified University, the present buildings, which are out of harmony, being lost behind the continuous front.

Coming to the general arrangement of the buildings themselves, the Library forms in plan the centre of the whole conception, and is a fine domed structure admirably suited to its purpose and symbolic of the idea for which the university stands. Grouped round it and within easy reach are all the various schools with well-lighted and direct communicating corridors which link up every part of the buildings.

The approach to the Library is opposite the main entrance in Woodhouse Lane and opens through a vestibule from the Students Court which is in itself one of the great features of the scheme as a centre of University life and one of considerable importance in this climate. From it every department is readily accessible, and each department is self-contained and clearly defined.

The Administration Building is, in my judgment, well placed, but is unfortunately detached and quite unnecessarily so, for it appears to me quite simple to link it up to the main entrance hall, and this, together with some slight rearrangement of rooms, would, I consider, make it a suitable and workable department.

The scheme depends on the removal of the diagonal arm of the existing Arts and Science building, a removal which is justified by permission given in the

conditions. I consider that this fully justifies itself, as it certainly stands in the way of a dignified and convenient lay-out. The attempt to retain this block has been detrimental to several of the schemes.

With regard to the treatment of University Road and Beechgrove Terrace, if I may venture to express an opinion, it appears to me that the realisation of this principle of bringing the precincts as far as possible into a ring fence is of great importance to the University. A public vehicular traffic route through the University itself might become both an interruption to University work and an inconvenience to the public. If University Road becomes private (the Corporation, of course, retaining access to services below the surface), I see it as becoming, together with the added open space between the buildings, a very fine series of quadrangular spaces, possibly tree-planted, which would serve not only for traffic between the buildings on either side, but an outdoor gathering place for students in fine weather, which will be of great importance in a site necessarily rather crowded, and will leave what open space remains among the buildings freer for future extensions. This space, supplementing the great entrance hall, will add much to the University life and dignity to the whole lay-out.

While the engineering scheme for services is not shown in detail, I see no reason why it should not work in principle under a modern system.

The author deals clearly in his report with the proposed order of building and of temporary provision for carrying on the work of the University, and it will be a matter for discussion between the University and their architect as to what may be the most convenient method of procedure, as is laid down in the conditions and instructions.

The buildings he proposes to erect first are the Physics and Chemistry block in order to replace the accommodation removed in the old buildings, then the Library and the Mining department.

May I congratulate the University on having secured a fine solution to a very difficult problem, and may I in conclusion offer my thanks for the most admirable arrangements made to enable me to carry out my duties as assessor.

NEW NEEDS AND MODERN NOTIONS—IV

By EDWIN GUNN, A.R.I.B.A.

Books might more often be provided for with advantage in the ordinary house. Nothing so cheerfully and pleasantly adds a finished look as a dado of books, and acting on the assumption that what used to be 7d. editions (now 2s.) will accumulate in most households quite beyond the storage capacity of the family bookcases, it is a useful thing to provide space for these in open shelving. If the chimney shelf, 7 inches wide, usually at a height of about 7 feet, is prolonged across the side or end of the room, filling recesses on either side of the chimney breast (where this projects), and the space below

Fig. 8.

filled with shelving to the level of the skirting, this will provide useful space and a humanized appearance. Convenient spacing is, bottom shelf 10 inches, two succeeding spaces 8 inches each, three upper ones 6 inches each, taking respectively quarto, octavo, and small octavo.

BICYCLES AND GARDEN IMPLEMENTS are possessed by most households, and it is surely rather futile to leave them so much to chance as generally happens, resulting in the deposit of a ready-made shed in a position often seeming rather accidental. These implements should be provided for just as much as any of the other household belongings. It may be taken as certain that in the best-ordered home there must be at times unsightly objects or unpleasant operations to be screened from view, which means that a paved yard adjoining the scullery door ought to be enclosed with this object. The garden shed may well form one side of this enclosure, and as it will rarely need to be of greater span than can be covered by the length of one sheet of corrugated iron, which can safely be laid to a very flat pitch when no joints in length occur—taking the precaution to lap side joints by two corrugations—it is quite permissible without offence so to cover the roof. When laid practically at a corrugated roof is invisible except from above and it offers conveniences in handling and support. It should be painted, or tarred after having weathered for a year or so.

WIRELESS.—Most residential districts are now rendered hideous by an untidy network of wireless aerials, and blatantly obvious masts of every degree of strength and weakness. The effect of the internal gadgets of the enthusiastic “wireless fan” is often no happier. I am only too familiar with a drawing room—once a pleasant place—which now has what appears to be the “innards” of a full blown telephone exchange obtruded in its midst. People presumably will continue to “string a clamorous magic to fence their souls from thought” (Kipling),

so that it behoves the architect to add one more to his burdens, and to do his best to circumvent the worst efforts of the amateur by providing for its orderly stringing. A good galvanised holdfast and pulley to a gable chimney should be arranged for, and if a suitable tree exists an aerial between the two may be relatively inconspicuous. In the absence of the tree a larch mast with its top of similar height to the chimney holdfast, and stepped like a mast so that it may be raised or lowered without the assistance of a navy gang, may be advisable.

Perforations lined with piping should be arranged inconspicuously for the introduction of the lead from the aerial to the apparatus, and it is not amiss to provide similar perforations by which extensions can be carried from room to room—your true wireless fan can hardly take a bath in comfort without the customary stimulus! As to the disposal of the “doings”—I have recently contrived a sort of enlarged telephone-box below the half-landing of quite a small house, entered by a few steps down from the Hall, and having its own window and a convenient workbench at the main floor level arranged below the bottom flight (Figs. 8 and 9), which has been rapturously received.

MOTOR GARAGE.—Much has already been written on this topic and I do not propose to add to it except on two points. It is a matter of surprise to me that sliding doors of the “round-the-corner” type are not more generally adopted. Their use prevents many minor accidents due to doors blowing or swinging to with damage to themselves or car; the first leaf provides an easy means of entry or egress to the garage without bringing the big doors into play; and the cost of doors and gearing does not exceed that of ordinary folding doors suitably framed and hung. In this connection it should be remembered that the doors are *suspended* and so do not tend to distortion from their own weight, while from similar causes a heavy frame is unnecessary. The

Fig. 9.

second point relates to the “wash,” upon which little effort seems usually expended in mitigation of its aggressive bleakness of appearance. Concrete made with gravel finished shovel-smooth is in the long run more satisfactory than a screeded cement surface, and it is much more harmonious with garden surroundings. This for the cheapest; for the less necessitous case a surface of rag slates bedded in the cement as a sort of big scale mosaic can be made quite an agreeable thing.

BUILDING CRAFTSMANSHIP—OLD AND NEW—IV

By Nathaniel Lloyd, F.S.A.

One stall remains of the old market at Shepton Mallet, where local produce was exhibited. It is a remarkable example of good design applied to a common purpose, as well as a fine specimen of carpenters' craft.

A house at Croydon (*circa* 1720) has its main roof valley rafters of oak, chosen for its growth being at the exact angle required. The lower part forms a post, from which the rafter bends.

THE CRAFT OF THE CARPENTER

By Nathaniel Lloyd, F.S.A.

The 15th-century porch ceiling of Boughton Malherbe Church is constructed of very substantial moulded beams and joists. Boards are laid longitudinally between the joists and were usually rebated to them, so that the backs of the beams and joists formed the greater part of the floor surface.

Modern half-timber work bristles with projecting ends of oak pins, with which every stud is secured. In 15th-century work only the framing timbers were pinned in, the studs were simply tenoned into mortises or reduced at the ends and set in grooves, which often ran the whole length of the beam. In the lower part of the illustration the tops of two framed-in posts can be seen, each secured with a pin, which is cut off almost to the face of the beam.

New Ways and Means

*The Editor will welcome early information of
New Plant, Materials and Fittings*

The "Francis" Lamp Lock.
(Francis Lamp Locks, Ltd.)

Guarding against "Missing Lamps"

An ingenious locking device designed to obviate the removal of electric light bulbs from lampholder sockets has been placed on the market by Messrs. Francis Lamp Locks, Ltd., of 83 Pall Mall, London, S.W.1. This fitting, once locked in position, can only be removed by breaking the lamp when the latter is burnt out. As shown in our illustration, it consists of an inner cup and an outer collar provided with an intermittent or "broken" screw thread, which permits rotation of the collar in one direction only, so that the assembled unit can be lengthened but not shortened. When locked in position upon the lamp, the upper part of the cup bears against the threaded shoulder of the lampholder, whilst the lower edge of the collar rests upon the glass bulb of the lamp, from which it cannot recede owing to the peculiar nature of the screw thread. Before fitting the lock, the collar should be turned to leave three or four threads on the cup projecting beyond the upper edge of the collar. The lock is then placed on the lampholder (cup uppermost) and the lamp is inserted into the holder in the usual way. Then gripping the projecting threads of the cup with one hand, continue to turn the collar until the unit is fully expanded between the lampholder and the glass bulb of the lamp. When the lamp has burnt out, the bulb must be broken in a bag provided for that purpose; it is then an easy matter to remove the lamp lock and the cap of the lamp from the lampholder. The lock, however, is a permanent fitting, and can be prepared for further use by completely unscrewing the inner cup from the outer collar, and reassembling the two parts from opposite ends.

A Refinement in Lavatory Traps

Lavatory traps in solid drawn copper and brass tube, showing several improvements over existing types, have recently been placed on the market by Messrs. Chisholm, Gray & Co., Ltd.,

of Providence Works, Fleet Street, Birmingham. These traps are supplied complete with a coupling for connecting direct to the waste outlet, the other end of the trap being adaptable for fixing to any standard cone fitting. Having an absolutely smooth bore, they are hygienic in use, there being no "rags" or roughness on the inside to catch any waste matter. The trap itself is made in two parts, the two being locked together by means of a coupling. The position of the outlet can therefore be varied to suit the requirements of any particular job, as indicated in our illustration, which shows the "S"-shaped fitting. The provision of this coupling in the centre of the trap also facilitates cleaning operations should the trap become accidentally choked. The initial cost of these "Cee-Gee" fittings is slightly higher than some of the lavatory traps on the market, but the reduction in cost of fixing occasioned by the elimination of wiped joints makes them a more economic proposition when fixed.

New "Cee-Gee" Lavatory Trap.
(Chisholm Gray & Co. Ltd.)

A Novel Switch Control

A simple device giving temporary control over an ordinary electric-light switch from a distance without the expense of additional wiring has been introduced by Messrs. W. B. Fordham & Sons, Ltd., of 36 York Road, King's Cross, London, N.1, under the name of the "Teleswitch." This device operates upon mechanical principles, the terminal parts being connected by a cable

The "Teleswitch" Fitting.
(W. B. Fordham & Sons, Ltd.)

control which can be supplied up to 15 ft. in length. One of these (shown in our illustration) is fixed to the switch block by means of an adjustable clamp, in such a manner that the switch knob engages in the housing of the trigger; the other end, which is essentially a control lever, is placed at the point where temporary control of the switch is desired. When extinguishing the light this control lever is released with a "snap-like" motion. In its present form the device can only be used in conjunction with the ordinary round tumbler switch, but the cable may be passed under carpets and care is taken to avoid sharp bends.

A New Floor Bridging

A new angle steel bridging for reinforced wood floors and floor framing has just been introduced by Messrs. The A.G. Co., of Oxford Building, Belfast. From our illustration it will be seen that this bridging is adapted to hold three joists, being nailed to the upper part of the inner face of the extreme joists and to the bottom of the centre one, by means of which rigid anchorage is secured, particularly if wire nails are used and clinched. The manufacturers are able to supply "Unity" Patent Floor Bridging of any size of joist and spacing, to facilitate transport the units are delivered "straight" and bent to shape on the job, this being a simple matter by reason of the method of construction which has been adopted.

"Unity" Patent Floor Bridging. (The A. G. Co.)

No. 7

ANOTHER great attribute of the service which we offer is the combination of value with low costs.

We pay carriage to the buyers' nearest railway station, and the risk of breakage, if any, in transit is ours.

Taking the value of this service into consideration, the price of the Courtrai-du Nord Tile is extremely low.

**THE COURTRAI-DU
NORD TILE CO., LTD.**

Courtrai-Du Nord
ROOFING — TILES

London Building Notes

BARKING.—Extensions are projected to the factory buildings at Jenkins' Lane, Barking, of Messrs. Gross, Sherwood & Heald, Ltd., paint manufacturers. Plans have been approved, the architects and consulting engineers being Messrs. Walter Bridges & Co., 37 Parliament Street, Westminster, S.W.1.

BISHOPSGATE.—New shops and offices are being erected on a Bishopsgate site by Messrs. Marcus Estates, Ltd., 9 New Bridge Street, E.C.4. The plans have been prepared by Mr. Paul Hoffmann, Capel House, New Broad Street, E.C.2.

BROMLEY.—Extensive estate development schemes are taking place in this locality, among which is one projected by Messrs. Vigers & Co., Surveyors, of 4, Frederick's Place, Old Jewry, E.C.2. A considerable number of good-class residences are to be built, and road construction to provide suitable frontages is now being taken in hand.

BROMLEY.—The First Church of Christ Scientist have bought an area of land in Widmore Road, Bromley, where it is proposed to erect a new church, and, later on, church schools. Mr. W. Braxton Sinclair, F.R.I.B.A., 8 Buckingham Street, Strand, W.C., who recently designed a similar building in Lancashire, has been commissioned to prepare the plans.

CHEAPSIDE.—Progress is being made with the demolition of the old property on the site of Nos. 97, 98 and 99 Cheapside, and Nos. 31, 32, and 33 Lawrence Lane, E.C.2, where it is intended to build a block of shops and offices. The new building will have a frontage of 62 feet and 100 feet respectively, occupying a site of 5,250 square feet. The architects are Messrs. Robert Angell & Curtis, Keith House, 133-135, Regent Street, S.W.1. The demolition and excavation is in the hands of Messrs. Greenham, of Isleworth.

DAGENHAM.—The Postmaster-General has confirmed a contract for the building of a new post office at Dagenham, to cost about £10,000. Plans have been prepared by H.M. Office of Works, Storey's Gate, Westminster, S.W.1, whilst the contractors are Messrs. Jones Bros., 112 Besley Street, Streatham, S.W.18.

FLEET STREET.—Progress is being made with the erection of the large office building in Fleet Street, E.C.4, which is to house, when completed, the staff of the *Daily Express* newspaper. The contractors are Messrs. Trollope & Colls, Ltd., 5 Coleman Street, E.C.2. The plans have been prepared by Messrs. Herbert O. Ellis & Clarke, Architects, 3 Old Queen Street, Westminster, S.W.1.

OLD BURLINGTON STREET.—New offices, with shops on the ground floor, are being built on the site of Nos. 10-

13 Old Burlington Street, W.1, consisting of 3-storey premises. The contractors are Messrs. F. & H. F. Higgs, Ltd., Station Works, Hinton Road, Herne Hill, S.E., the plans having been prepared by Messrs. Robert Angell & Curtis, 133-135 Regent Street, W.1.

RICHMOND.—Work is about to start upon the reconstruction of the property in the Quadrant, which has been acquired by the Saxone Shoe Co., Ltd., 60 Strand, W.C., for opening as a branch stores. The alterations, etc., referred to in *THE ARCHITECT AND BUILDING NEWS* on January 7, are to be carried out by Messrs. Barrett & Power, 215 Upper Thames Street, E.C.4.

RICHMOND.—Excavations are now in progress on the large site in George Street and Red Lion Street, Richmond, where the directors of Messrs. Edwards & James, Ltd., dairymen, propose to build a dairy, restaurant, offices and stables, at a cost of about £15,000-£20,000. The building will be of three floors, and has been designed by Mr. F. T. Dear, A.R.I.B.A., United Dairies, Ltd. The builders are Messrs. Truett & Steel, Ltd., Thornton Heath.

ST. PANCRAS.—The London County Council have decided to contribute substantially to the estimated cost, £120,000, of the proposed North-Western Polytechnic Institution. It is proposed to build in three sections, and to provide social facilities in addition to those for technical education. The plans, prepared originally before the War, are the work of Mr. W. E. Riley, F.R.I.B.A., M.Inst.C.E. (Messrs. Riley & Glanfield), Raymond Buildings, Gray's Inn, W.C.

STRAND.—Important reconstruction plans are being considered by the Civil Service Supply Association, Ltd., in regard to their premises in the Strand and Bedford Street, W.C. It is intended to extend the site so as to build around the frontages bounded by the Strand, Agar Street and Chandos Street, and excavations for a new addition—the first of the plan—in Agar Street are now in progress. The architects to the Association are Messrs. Herbert O. Ellis & Clarke, 3 Old Queen Street, S.W.1.

STRATFORD.—New offices and warehouses are to be erected on a site in Medland Street, E.14, in place of the old Medland Hall, which was destroyed by fire some time ago. A block of modern premises has been designed by Mr. Charles Living, junior, P.A.S.I., 75 The Grove, Stratford, E.15.

SUBURBS.—Messrs. Garrett, White & Poland, surveyors, 17 Hanover Street, W.1, are enquiring for a site in a suburban shopping thoroughfare, with a frontage of from 100 to 200 feet, upon which to erect a row of shop premises.

TRAFALGAR SQUARE.—An additional block of buildings is to be erected at the National Gallery to accommodate a collection bequeathed by the late Dr. Ludwig Mond. This will occupy a site between the National Gallery and the National Portrait Gallery, and has

been designed under the direction of H.M. Office of Works, Storey's Gate, Westminster, S.W.1. The builders are Messrs. A. Roberts & Co., Ltd., Earl's Court Road, W.8.

TEDDINGTON.—Some further additions are to be made to the National Physical Laboratories at Teddington by order of the Home Office. Plans have been prepared by H.M. Office of Works at Storey's Gate, Westminster, S.W.1, and a contract has been given for the carrying out of the work to Messrs. F. G. Foster & Co., builders, S.E.

TOTTENHAM.—A reconstruction scheme is being carried out to the range of shops and showrooms at Nos. 229-249 High Street, N., owned by Messrs. Ward's Stores, Ltd., general furnishers. The builders are Messrs. Allen Fairhead & Sons, Ltd., of Enfield, who are working under the direction of Messrs. T. Jay Evans & Sons, Newton Street, W.C.1, the architects.

WANDSWORTH.—The large "Picture House" at Wandsworth Road, S.W., owned by Supershows, Ltd., is to be completely rebuilt and extended, the owners having in view a theatre which will be capable of seating about 3,000 persons. Plans have been prepared by Messrs. Petch & Fermaud, 12 Buckingham Palace Road, S.W.1.

WEMBLEY HILL.—Plans have been prepared for the erection of a large church, church institute and vicarage to serve the needs of the new parish of St. Michael, formed at Tollington. The buildings will cost about £20,000, and have been designed by Mr. J. Percy Pratt, J.P., 174 High Street, Acton, W.3.

WEST NORWOOD.—A local syndicate has purchased a large site, Nos. 160-162 Broadway, in Norwood, S.E.27, upon which they propose to build a modern picture theatre, café, shops, etc., the cinema providing accommodation for about 1,000 persons. Plans have been drawn up by Mr. F. Edward Jones, 8 Gloucester Mansions, Cambridge Circus, W.C.

WESTMINSTER.—The public baths and wash-houses in Marshall Street, S.W.1, owned by the Westminster City Council, are to be completely rebuilt, at a considerable cost. Plans have been prepared by Mr. L. J. Veit, M.Inst.C.E., the City Engineer, who has engaged Mr. A. R. Conder, 42 Cecile Park, N.8, to carry out the architectural details.

WILLESDEN.—Work is to be put in hand upon the building of a row of 5 shops on a site in Neasden Lane, N.W.10. The builders are Messrs. Cattram Bros., 14 Elm Way, Neasden, N.W.10.

WILLESDEN.—New manufacturing premises are to be built on a site in Edgware Road, N.W.10, for Messrs. C. B. Wardman & Co., Ltd., automobile engineers, Great Portland Street, W.1. The buildings are being erected by Messrs. Dove Bros., Ltd., Cloudeley Place, Islington, N.1, to the plans of Mr. W. M. Geall, architect, Windsor House, Victoria Street, Westminster, S.W.1.

Danger of Dry Rot in hidden woodwork

House near Southampton infected with Dry Rot.

The importance and economy of protecting all the woodwork against Dry Rot cannot be overestimated.

Wood treated with Solignum is immune from every kind of decay, and if the treatment is given while the houses are in course of erection, the cost is so small as to be negligible.

All the hidden woodwork should be treated, especially joists, the under-side of ground floor flooring, wall-plates and roof timbers.

Property so secured against costly repair bills is enhanced in value, is a better investment, sells more readily.

But it must be Solignum.

The Week's Building News

The following abbreviations are used: U.D.C. for Urban District Council; T.C. for Town Council; R.D.C. for Rural District Council; E.C. for Education Committee; B.G. for Board of Guardians; P.C. for Parish Council; B.C. for Borough Council; M.H. for Ministry of Health; M.T. for Ministry of Transport; C.B. for County Borough; B.E. for Board of Education.

ACTON.—A municipal sports pavilion is to be erected in Acton, at a cost of nearly £3,000.

BARNET.—The B.G. have passed plans for extensions to the nurses' dining-room at the institution, at an estimated cost of £3,900.

BENTLEY (YORKS).—The U.D.C. are to erect 32 houses and 16 bungalows, at a cost of £24,500.

BERWICK-ON-TWEED.—A cinema is to be erected at Hide Hill, Berwick-on-Tweed, by the Berwick Theatre, Ltd., in accordance with plans prepared by Mr. Alfred Schofield, F.R.I.B.A., of Stockport. The scheme includes a café, shops and arcade.

BIDEFORD.—The Corporation are to erect 32 houses on the Handy Cross Estate.

BIRKENHEAD.—Application is being made to the M.H. for sanction to the borrowing of the sum of £21,316 for erecting and furnishing the New Cole Street Council School.

BIRMINGHAM.—A new Stock Exchange is to be erected on a site in Margaret Street, at the corner of Great Charles Street, at a cost of about £50,000. The contractors are Messrs. W. J. Whittall & Sons, Lancaster Street, Birmingham, whilst the plans have been prepared by Mr. S. N. Cooke, F.R.I.B.A., Queen's College, Paradise Street, Birmingham.

BIRMINGHAM.—It is proposed to erect a new Palais-de-Danse in Walford Road, on the existing premises of the Empire Rink, and to spend £11,000 or £12,000 on the structure of the building.

BLACKPOOL.—Plans for 322 new houses, including several big schemes, were approved by the Building Plans Committee of the Corporation at a recent meeting.

BOOTLE.—The local Presbytery of the Presbyterian Church of England has decided on a scheme for the erection of a new hall at Linacre Park, Bootle, at an estimated cost of £3,500.

BOSTON.—The R.C. recently decided to take steps to secure further sites and recommence building in various parts of the district.

BRADFORD.—The Bradford E.C. propose to spend £116,515 on the erection of new schools.

BRIGHOUSE.—Approval has been given by the West Riding E.C. for the provision of a technical school and a secondary school at Brighouse, at an estimated cost of £64,000.

BRIGHTON.—It has been decided to build a new block at the Children's Hospital in Dyke Road, which will provide a violet-ray clinic, a thoroughly up-to-date operating theatre, an anaesthetic room, and additional accommodation for the resident medical staff. The estimated cost is £10,000.

BRISTOL.—The scheme recently put forward by the Bristol Corporation for the construction of a power electricity-generating station is now to be put in hand. The plans have received the

approval of the Electricity Commissioners, and the City Council has sanctioned the immediate placing of the necessary contracts, which are understood to total about £1,000,000. It is proposed that the main contract for the construction shall be placed with Messrs. Vickers, Ltd., the whole of the electrical plant being supplied by the Metropolitan Vickers Electrical Co. as sub-contractors.

CANTERBURY.—Commencement is now to be made with the erection of a picture palace, for which plans have been prepared by Messrs. Dore & Anderson, architects, of Canterbury.

CARDIFF.—Mr. A. E. Abraham is believed to have in contemplation the expenditure of £1,000,000 on a big theatre scheme at Cardiff. A Wesleyan Church is to be erected at a cost of £25,000.

CATERHAM.—The U.D.C. surveyor is to prepare plans for the erection of 24 houses on the Valley Estate.

CHELSEA.—The B.G. are to consider, at its next meeting, the suggested expenditure of £28,864 for alterations and extensions to St. Luke's Hospital.

CHRISTCHURCH.—The T.C. has approved plans for the erection of 70 houses on the "Homelands" Estate in Barrack and Stour Roads.

COVENTRY.—The Corporation are to erect 100 houses on the Radford Housing Estate.

CROYDON.—The B.C. have passed plans for the erection of 111 houses, for F. H. Willcocks, at Chipstead Avenue, Foxley Road, and Warlingham Road; and for 20 houses, for S. Springer, at Springfield Road.

CROYDON.—The M.H. has sanctioned the borrowing of £14,600 in connection with the Activated Sludge Process works at Beddington Farm.

DARWEN.—The Corporation are to erect 42 houses on various sites.

DEVONPORT.—Following representations to the Ministry of Health and the Admiralty, the Ministry has placed in the hands of the Mayor of Plymouth a scheme to provide 174 houses for dockyard employees, at an approximate cost of £100,000, and the Admiralty have offered the free gift of land at Budeaux, valued at £4,000.

DONCASTER.—The West Riding magistrates' office, together with police court and cells, is to be extended, at an estimated cost of £20,000.

DUDLEY.—Work is shortly to be initiated upon the first section of the proposed new Technical College in Priory Road and Ednam Road. This section—the engineering block—is estimated to cost £30,000. The plans have been prepared by Mr. A. T. Butler, F.R.I.B.A., 31 Priory Street, Dudley.

DUDLEY.—The Ministry has sanctioned the borrowing of £25,464 for the erection of 56 houses on the Watson's Green site, Dudley.

DUNDALK.—The U.C. has adopted plans for 39 new houses.

DUKINFIELD.—The Corporation are to erect 75 houses on the Clarendon Fields Estate.

EAST BARNET.—The U.D.C. have passed plans for the erection of 34 houses in Netherlands Road, for Messrs. Welch & Hollis.

ELTON.—A start has been made on the building of a new Council school to the designs of Mr. F. A. Brown, deputy county architect (Cheshire). The contractors are Messrs. J. G. Davies & Co., Brook Works, Frodsham. The contract price is a little under £9,000.

ENFIELD.—Five hundred Enfield Council houses will be built near Albany Park.

EVESHAM.—The M.H. have sanctioned the building programme of the R.D.C., which provides for the erection of 90 houses.

FALKIRK.—The Falkirk T.C. has been granted warrants to build 276 more houses, at a cost of £101,000. At Gairdoch, 122 houses will be built, and at Millflats 114 of the Dugdale-Dennis steel-frame type. The remaining 40 are to be erected at Burnhead Lane, for the tenants dispossessed by the Council's slum clearance scheme.

FALMOUTH.—Plans for a new theatre at Falmouth have been prepared by Mr. C. R. Corfield, A.R.I.B.A., for Messrs. Harris Bros.

FORFAR.—Forfar Infirmary Directors, at their annual meeting recently, decided to proceed with the construction of nurses' quarters, at a probable cost of £7,000.

GREAT BARR.—Mr. Gerald McMichael, A.R.I.B.A., of Birmingham, has prepared the plans and specifications for the building work in connection with the scheme to be carried out by the Walsall and West Bromwich Unions. Tenders are being invited for the erection of the buildings.

GREAT CROSBY.—The U.D.C. are to erect 50 houses at Endbutt Lane.

GUILDFORD.—The Housing Committee of the T.C. are recommending the Council to erect 48 flats on the Aldershot Road site.

HALDON.—Devon and Exeter Steeplechase Committee are to erect a new grand stand at Halton racecourse. Plans have been prepared by Mr. J. A. Lucas, of Exeter.

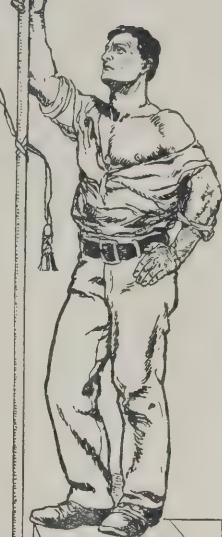

HAMMERSMITH.—The Anglo-American Oil Co., Ltd., are to erect a depot in Shepherd's Bush Road, Hammersmith.

HARROGATE.—The Corporation are to erect 150 houses on the Devonshire Place Estate.

HATFIELD (YORKS).—West Riding E.C. is to erect a new elementary school in Doncaster Road, at an estimated cost of £18,000.

HEMSWORTH.—The U.D.C. are to erect 76 houses at Kinsley, at a cost of £38,500, and the R.D.C. have a scheme for erecting another 280.

HENDON.—The U.D.C. are acquiring two sites on the L.C.C. Watling Housing Estate for the erection of elementary schools.

Registered **'PUDLO'** Trade Mark

BRAND

CEMENT WATERPROOFER

GOOD material inspires the craftsman to the most cunning exercise of his skill. Cement mortar, when mixed with 'PUDLO' Brand powder, has a plastic, manipulative property that the plasterer is otherwise tempted to obtain by an extravagant proportion of cement; such excess of cement is the chief cause of hair cracks and crazing.

Simple specifications of proved reliability are given in the Handbook of Cement Waterproofing—post free on request.

PREVENTS RAIN SOAKAGE & STAINS.

UPHELD BY THE WORKER BECAUSE IT IS SIMPLE IN USE

UPHELD BY THE WORKER BECAUSE IT IS SIMPLE IN USE

KERNER-GREENWOOD & Co., LTD. ANN'S FORT, KING'S LYNN.

word 'PUDLO' is the registered Trade Brand of Kerner-Greenwood & Co. Ltd., by whom all article bearing that Brand are manufactured or guaranteed.

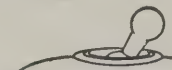

The Hall Mark of Your Craftsmanship

IN our preceding announcements we indicated how Craftsmanship in the Electrical Industry is reflective; that the accessories used, for example, in an installation reflect the standard of Craftsmanship of those who fit them.

The standard of work is thus judged by the user in subsequent service—particularly in the Switches, the only moving parts of the installation. If the wiring is ever so good—a neatness in workmanship and a high standard of Electrical Craftsmanship in other respects attained—yet it is the efficiency, the durability of these "moving parts" that sets the seal of excellence on the complete installation.

Hitherto—we have striven to show the supreme honesty of purpose that lies behind the "Crabtree" Switch—the patient research—the drastic tests—backed by an all-pervading quality that has won it universal appreciation. Now we would emphasise how that same lofty standard is maintained in all the "Products of Craftsmen"—how the name "Crabtree" is a sure guarantee of sincerity in all things.

"CRABTREE" Registered Trade Mark.

HERNE HILL.—Forty shops are being built in Norwood Road, Herne Hill.

HOVE.—Mr. D. S. Barclay is to build 24 houses in Braemore Road, Hove.

HULL.—The Hull Corporation has received the sanction of the M.H. to borrow £11,372 for the erection of another pavilion and isolation cubicle block at the Infectious Diseases Hospital at Cottingham.

KENSINGTON.—On behalf of Messrs. M. & E. J. Hill, Messrs. Joseph are to erect buildings on a large site in Kensington Road. Messrs. Joseph are also to lay out two new streets on the site on behalf of the Prudential Assurance Co., Ltd.

KENSINGTON.—The L.C.C. have prepared a scheme for widening Kensington High Street, at a cost of £451,000.

LONDON.—Plans have been prepared by the Co-operative Society for extensions to the premises in Leman Street.

Longbenton.—The U.D.C. are to build 38 houses on the Benton site.

LOUGHBOROUGH.—The Loughborough Corporation last week decided to erect 100 houses on the Shelthorpe Housing Estate, and to seek sanction for a loan of £51,260 for the purpose.

MACCLESFIELD.—The R.D.C. are to erect 48 houses on various sites.

MIDDLESBROUGH.—Middlesbrough Corporation decided recently to build 100 new houses on their estate at Marton Grove—30 at £310 each, and 70 at £325 each.

PENMAENMAWR.—The Council intends to proceed with the erection of a further 20 houses on the site off Gilfach and Cwm Roads.

READING.—Lloyds Bank, Ltd., are to erect a branch in Reading in accordance with plans prepared by Mr. J. P. Briggs, F.R.I.B.A.

ROCHFORD.—The Guardians propose to expend £10,858 in connection with the proposed extension of the male hospital.

ROTHERHAM.—The B.E. has notified the Rotherham Education Committee of their approval in principle of a building scheme involving an outlay of about £140,000. The proposals include the erection of a new elementary school at Thorpe Hesley, a new infants school at Cranworth Road, a new central school at Cranworth Road, and a new elementary school site near the Deepdale and Meadow Bank Road housing sites. The Committee are also to proceed with the work in connection with the proposed new Technical College and School of Art, and additional accommodation at the Rotherham Grammar School.

SMETHWICK.—Of over 400 houses which the Smethwick Council have decided to provide, 350 have been commenced, while a further 100 houses are to be erected at Hales Lane.

STOCKTON.—The Borough Engineer has prepared plans for an isolation hospital extension scheme, at a cost of £13,000.

SWANSEA.—Mr. Sidney Davies is to erect 46 houses at Cocket Road and Gorse Road.

TILBURY.—At the last meeting of the U.C. it was reported that the Council had 1,450 completed houses out of a total of 1,670 to be erected.

TOLWORTH.—The Surbiton D.C. have

passed lay-out plans for the erection of 47 houses on the Tolworth site, to plans prepared by Mr. J. Hill, architect, Southborough.

TOTTENHAM.—It is proposed to erect new offices, including a house for the superintendent, at the Tottenham Cemetery, N., for the Tottenham and Wood Green Burial Board. Building work will shortly be put in hand under the direction of the architect, Mr. J. C. S. Mummery, F.R.I.B.A., Bloomsbury Square, W.C.1.

TUNBRIDGE WELLS.—Designs are in course of completion for the building of the proposed hospital for the governors of the Tunbridge Wells and Counties General Hospital. The architect is Mr. Cecil Burns, 5 Calverley Terrace, Tunbridge Wells.

VINCENT SQUARE.—A hall is to be erected in Vincent Square, S.W.1, for the Royal Horticultural Society, for the purpose of holding exhibitions. The building will possess five floors and the main hall will be 120 feet wide. Reinforced concrete construction, designed by Dr. Oscar Faber, D.Sc., 37 Duke Street, St. James's, S.W., is largely employed, the architects being Messrs. Easton & Robertson, 36 Bedford Square, W.C.1. The builders are Messrs. Foster & Dicksee, Ltd., Manresa Road, S.W.

WALSALL.—The Walsall Corporation Housing Committee is recommending that land belonging to the Corporation in High Street, Bloxwich, be appropriated for housing purposes, and that 5 houses with shops combined be erected on it at a cost of £3,700. It is also proposed to purchase 3 acres of additional land in connection with the Four Crosses Housing site, at a cost of over £1,440.

WATH.—The West Riding C.C. propose to erect new buildings for the Wath Secondary School, at an estimated cost of £41,050.

WATH.—New buildings are to be provided by the West Riding E.C. for the Wath Secondary School, at an estimated cost of £41,000.

WATH-UPON-DEARNE.—On behalf of the U.D.C., Messrs. Tennant & Smith, of Pontefract, have prepared plans for 100 houses to be erected on the Melton Housing Estate.

WEMBLEY.—The U.D.C. are to build another 50 houses on the Christchurch Estate.

WESTBOURNE (SUSSEX).—The R.D.C. have decided to erect another 20 houses at Funtington and Bosham.

WESTGATE.—Plans for the rebuilding of the Westgate Picture House on the present site and most of the adjoining site between the building and Cross House were recently approved.

WEST RIDING.—Proposals will be made at the next meeting of the West Riding County Council to make alterations to the Doncaster police station and petty sessions room, at an estimated cost of £20,000, and to build new schools at Doncaster Road, Hatfield, at a cost of £18,000, and at Birkenshaw, at a cost of £6,600.

WHITWOOD.—The West Riding E.C. is to erect a mining institute at Whitwood, at an estimated cost of £40,000.

WIMBLEDON.—A property development proposed emanates from Wimbledon, S.W., where it is proposed to

build a block of 5 shops with flats above and 20 houses on a site in Hill Road, Woodside, and Alwyn Road, S.W. The plans have been prepared by Messrs. North, Robin & Wilsdon, 35-39 Maddox Street, W.1, on the instruction of the owners, The Marcus Estates, Ltd.

WINDSOR.—The Corporation have decided to build 144 houses.

WOOD STREET.—The super-structure contract for the erection of the large 9-floored "Metropolitan" telephone exchange in Wood Street, E.C.2, has been placed with Messrs. Galbraith Bros., 63 Waterloo Street, S.E.5, whilst the supply and erection of the extensive Portland stone frontage will be undertaken by Messrs. Trollope & Colls, Ltd., 5 Coleman Street, E.C.2. The steel framework has been fabricated by Messrs. Archibald D. Dawney & Sons, Ltd., Battersea, S.W. The plans for the building were prepared by H.M. Office of Works, Storeys Gate, S.W.1.

WOLVERHAMPTON.—The Management Committee of the Wolverhampton and District Hospital for Women is to proceed with the scheme decided upon some time ago for the erection of extensions which will include a maternity hospital with 21 beds, a home for 22 nurses, a department with eight beds for septic cases, and a new laundry. The estimated cost is £24,000.

WOMBWELL.—West Riding E.C. are seeking a loan of £32,000 for the erection of a middle school at Wombwell.

Prices of Portland Cement

In a recent communication The British Portland Cement Association Ltd., state the notice which has recently appeared in the Press regarding the report of the Inter-Departmental Committee appointed to survey the prices of building materials is rather misleading, inasmuch as these notices have stated: "There has been a rise in the price of Portland cement. The rise in England, with slight variations amounts to 10s. per ton, and in Scotland to 15s." They would point out that the report covers a period ending November 26, and the increase referred to relates to a temporary surcharge imposed by The Cement Makers of Great Britain on day-to-day orders which only operated from October 28 to December 15. This surcharge became absolutely necessary owing to the excessive cost of fuel caused by the Coal Strike. Although the cement industry was greatly affected by the Coal Strike from the beginning, since it takes almost half-a-ton of coal to manufacture one tone of cement, this product was, perhaps, the last to be increased in price and the first to be reduced to normal.

The Royal Sanitary Institute

The annual congress will be held at Hastings from July 11 to 16. Among the sectional meetings for the reading and discussion of papers will be an Engineering and Architectural Section. The President will be Mr. H. D. Searles-Wood, F.R.I.B.A., and the Recording Secretary, Mr. H. Morley Lawson, M.Inst.M.E., Borough Engineer and Surveyor, Deptford.

Building Tenders Accepted

BARDNEY (Lincs.).—A contract has been placed by the Lincolnshire Beet Sugar Co. with Sir Robert McAlpine & Sons, for the erection of a large sugar beet factory at Bardney.

BIRMINGHAM.—The Public Works and Town Planning Committee have placed a contract for 1,000 new dwellings, mostly of the parlour and non-parlour type. A large share of the contract has been given to Mr. Edwards, of Birmingham.

BRENTFORD.—The U.D.C. have accepted the tender of Messrs. W. Hayward & Sons, Ltd., for wrought iron fencing at 7s. 1d. per yard, and gates at £8 15s., for the Boston Manor Park.

CANTERBURY.—The Corporation have made a contract with Mr. P. D. Davis, Margate, for the erection of 98 houses at the Thanington Estate.

CHELMSFORD.—The T.C. have accepted the tender of Messrs. G. J. Hawkes & Sons, Rainsford Works, Chelmsford, of £22,167, for the erection of a school, outbuildings, caretaker's house, etc.,

CHESHUNT.—The U.D.C. have accepted the tender of Messrs. J. Oram & Son, Eastbrook, Waltham Abbey, for £13,470, for 32 houses on the Paul's Nursery site, Waltham Cross.

COVENTRY.—For the erection of a new vicarage at Radford, the tender of Messrs. Kelly & Son, of Little Heath, has been accepted, the amount being £2,975. Messrs. Crouch, Savage & Co., 67, New Street, Birmingham, are the architects.

DARLASTON.—The tender of Mr. A. C. S. Teece has been accepted for the erection of houses by the U.D.C., at £774 per pair.

EDMONTON.—For the enlargement of the Latymer School, Edmonton, for the Middlesex C.C., the tender of Messrs. H. Knight & Son, Tottenham, at £67,380, has been recommended for acceptance.

EXETER.—The Corporation have made a contract with Messrs. J. Laing & Son, Ltd., for the erection of 102 concrete houses at the Buddle Lane Housing Estate.

FECKENHAM.—For the erection of eight houses at Astwood Bank, six at Cookhill, six at Crabb's Cross, six at Feckenham, and six at Inkberrow, the tenders of Messrs. Harrison Bros., of Redditch, for the Astwood Bank, Crabb's Cross and Feckenham houses, and that of Messrs. Huxley, of Astwood Bank, for the Cookhill and Inkberrow houses, have been accepted by the R.D.C. The total contracts amount to £16,266.

GLASGOW.—The Corporation Housing Committee have accepted the tenders of the Balshagray Building Co., Ltd., for chestnut fencing and posts at £897 7s. 3d., and Messrs. A. & J. Main & Co., Ltd., for iron railings and gates at £2,117 6s. 2d., for 500 houses.

GLASGOW.—The Corporation Housing Committee have accepted the tender, £61,329, of Messrs. Robert Anderson & Co., for the erection of 156 tenement houses at Brand Street, Govan.

GLASGOW.—The Corporation have accepted the following tenders for the erection of electricity substations: Messrs. Murdoch & Son, £666, in Aitkenhead Road; Messrs. T. Cooper and Co., £708, in Ralston Drive.

A SUGGESTION

MAY we suggest that before purchasing Fireplace Suites or Sanitary Appliances you and your Clients should visit our recently re-arranged Showrooms at 17 & 18 Upper Thames Street, London, E.C.4.

The range of Fireplace Suites offered for inspection is a very wide one. A special feature is the number of beautiful Period Designs, many of which we owe to our own craftsmen of a century ago.

The Register Grate illustrated is in Armour Bright finish and fitted with the Hot Hearth Fire. It is particularly suitable for office or country house use.

Edinburgh University Extensions

The International Education Board, New York, one of the Rockefeller foundations, has recently made a gift of £74,000 to the University of Edinburgh. This gift is to be applied as a contribution to the cost of a new Department of Zoology, which is to be created at the King's Buildings of the University, West Mains Road, in the Craigmillar district of the city. Of the total sum, £38,000 is for buildings, £10,000 for equipment, and £26,000 for endowment. Plans will be prepared by Sir Robert Lorimer in consultation with Professor Ashworth, Professor of Zoology. Building will proceed as soon as possible.

New Beet Sugar Factory

A large beet sugar factory (one of the largest in the country) is to be erected at Bardney, near Lincoln, at an estimated cost of £552,000. The contract has been signed between the Lincolnshire Beet Sugar Co. and Sir Robert McAlpine & Sons, the contractors, and the work will be carried out under the supervision of the Dyer Company of America.

A Concrete Suburb

The first batch of houses on Well Hall Estate, Woolwich, was recently officially handed over to the Woolwich Council. It is expected to complete these 500 "Easiform" concrete houses in twelve months—a record for speedy construction. One hundred and fifty houses are now built, and others are being finished at the rate of ten a week. This number will be increased to six-

teen a week in February. The contractors for the work are J. Laing & Son, Ltd.

Asphalte Mines Concession

We understand that the Ragusa Asphalte Paving Co., Ltd., of 25-27, Oxford Street, W.1, have acquired the important concession of the Montrotier Asphalte Mines in the Bassin de Seyssel area, Haute Savoie, France. These mines constitute some of the most important in the whole of the Seyssel Basin, and yield an exceedingly high-grade asphalte rock with a rich bitumen content. The Montrotier rock asphalte has been used extensively in this country for over 30 years, and its qualities have earned for it the reputation of being a high-class material of great reliability. The Ragusa Asphalte Paving Co. are also sole concessionaires for Cardebois asphalte from the mines of that name. According to a recent geological survey the visible supply of high-grade rock from these two mines should be sufficient to enable them to yield an unlimited output for many years.

Trade Catalogues Received

S. W. Francis & Co., 64-70, Gray's Inn Road, London, W.C.1. 39 pp. A new edition of their illustrated catalogue, giving particulars of their well-known rolling shutters, etc.

International Combustion, Ltd., Africa House, Kingsway, London, W.C.2. 30 pp. An illustrated catalogue giving full particulars of the Lopulco Pulverised Fuel System. It is stated that by the end of 1925 as many as 90 Lopulco equipments had

been installed through Europe, Asia and America, increasing the total heating surface to 3½ million square feet.

Lewisham Timber Co., Ltd., Lewisham Bridge, S.E.13. This illustrated catalogue, the latest issued, of Wired Pale Fencings, combines several new features and styles: the prices are very clearly displayed.

Herbert Morris, Ltd., Loughborough, England. An illustrated catalogue giving full details of the well-known Morris "Time-Saving Runway."

British Thomson-Houston Co., Ltd., Crown House, Aldwych. A short typescript giving particulars of their latest development—the Pearl Mazda—to users of electric lamps.

Smith, Major & Stevens, Ltd., London and Northampton. 16 pp. An attractively produced booklet entitled "The Importance of Lift Reliability." Those who appreciate the necessity for "Safety First" in lift production will write for a copy of this pamphlet.

Woco Door Co. We have received a tastefully designed showcard and some interesting matter describing the Adelphi door, a product of the Woco Door Co. This door is constructed by a special laminating process, and has been subjected to exhaustive heat and water tests to discover and rectify any tendencies to warp or shrink. They are said to last well, to hang true and run easily, and locks and hinges may be fitted without fear of split rails or stiles. Further information may be obtained from the Company's West End Showroom at 55 Rathbone Place, where examples in many different treatments may be seen.

What kind of roof?"

Client : What kind of roofing do you suggest?

Architect : Well, there is nothing better than "VULCANITE," which will give to any movements in the boards or concrete.

Client : Is it weatherproof?

Architect : Yes, and also fire resisting when sprayed with gravel.

Client : What length of life has it?

Architect : Lasts much longer than any other material I know of.

Client : But I suppose it's rather expensive?

Architect : Not at all ! That's just the remarkable thing about "VULCANITE," it's cheaper and certainly better in every way. That's one thing that time has proved beyond doubt.

"VULCANITE" roofing is used under the London Building Act and the Bye-laws, etc., of all Borough and Urban District Councils; and is accepted by all the leading Fire Insurance Companies as an Insurance Tariff Roof

We shall be pleased to have your request for our Illustrated Booklet, and to supply detailed drawings and estimates free.

Needling, strutting or shoring, including all labours and use and waste in erection and removal	Per Foot Cube 5/-
DEMOLITION	
Pull down brickwork	Per Ft. Super reduced quantities 6d.
Add, if in very small quantities not exceeding 21 ft. out to carts	3d.
Add for filling baskets with debris and running same	1 1/2d. 1 1/2d.
Add if debris has to be raised or lowered to ground level	2d. Usually dropped
Add for cartage when same costs 4/6 per 1 1/2 yard load	2 1/2d. 2 1/2d.
Clean and stack old bricks	20/- per thousand
Hack off old plaster	1/- per sq. yd.

EXCAVATOR, CONCRETOR AND DRAINS.

Excavate in common soil, wheel, fill carts and cart away	Per Yard Cube 5 ft. deep 9/6	5 ft. to 10 ft. deep 11/-	Add if in trench 9d.
Planking and strutting	4d. per foot super.		
Planking, strutting and shoring	1/-		
Portland cement and ballast	1 to 6 29/6	1. 2. 4. 36/6	Hoisting 2/6
Concrete in foundations			
Add if in ground floors	2/-	2/10	2/6
Add if in beams or lintels	3/-	4/-	2/6
Tested stoneware drains jointed in cement or standard iron drains jointed in lead, per foot run	Earthware 4 in. 2/-	6 in. 3/-	Iron 4 in. 3/- 6 in. 4/6
Extra only for bends, each	2/6	3/6	11/6 20/-
Ditto, for junctions, each	3/-	4/3	19/- 35/-
Gullies, including concrete surround and iron grating, each	16/-	18/6	35/- 50/-

BRICKWORK (Exclusive of Pointing).

Built in 1 to 3 lime mortar	Per Rod Reduced Flettons 616/-	Stocks 821/-	Blues 1055/-
" " cement mortar	636/-	941/-	1075/-
Damp course			
Two courses of slates in cement	Per Foot Super Horizontal 10d.	Vertical 1/3	
1-in. asphalt	9d.	1/-	
Facings			
Allow for every 5s. additional cost of the facing bricks over the common brick basis	Per Foot Super Flemish bond 1/4d.	English bond 1/4d. plus 10%	
Pointing (exclusive of scaffolding)		Per Ft. Super 2 1/2d.	
Weather joint in cement			1 1/2d.
Flat joint in cement (struck) and lime whitening			

ARCHES.

Extra over common brickwork	Per Ft. Super 1/-
In half-brick rings of bricks of same class as common brickwork	1d.
Add if of superior bricks for every 7/6 per thousand additional cost	1d.
In rubbed and gauged arches with fine joints	6/-
Quoins, angles, copings and sills of superior bricks	Per Ft. Run 1/-
Allow for every 5s. per thousand additional cost of bricks over the common basis price	1d. plus 10%
Double-tile creasing and cement fillets and pointing to 9-in. wall	1/2

PAVING.

	Per 1 in. 1 1/2 in. 1 3/4 in. 2 in. 3 in.
Cement and sand	3/- 3/5 3/10 4/8 —
Granolithic	4/2 4/9 5/3 6/4 —
Asphalte	7/- — — 4/8 6/6
Tarmac	— — — — —

MASON.

	Per Foot Cube
York stone and all labours and mortar in hoisting and fixing	Templates 12/6
Artificial stone	Stairs 9/-
Portland stone and all labours of usual character	16/6
Bath stone ditto	8/-
	To Elevation generally 19/6
	10/6

SLATER AND TILER.

	Per Square Countess	Ladies
Welsh slating laid to a 2 1/2-in. lap with two com-position nails to each slate	80/-	72/-
Add for every 1/2-in. additional lap	2/3	3/7
Add for copper nails	2/3	3/4
Best selected green Westmorland slates laid to a 3-in. lap, with copper nails		135/-
Asbestos slates laid to a 3-in. lap, with compo. nails		41/-
Asbestos corrugated roofing with galv. screws and limpet washers		60/-
Plain red roof tiling 4-in. gauge, each tile in every fourth course nailed with two galv. iron nails		70/-
Add for vertical work		2/6
Add for circular on face in elevation		25%
Add for circular on plan, according to radius		40%
Add for circular on face in elevation and also on plan according to radius		66 2/3%
Old Delabole slates fixed complete—		
Size	Medium Grey	Medium Green
24 x 12 in.	90/-	93/-
20 x 10 in.	95/-	100/-
16 x 10 in.	86/-	91/-
14 x 8 in.	80/-	86/-
Green Randoms No. 2		115/-
Grey-Green Randoms		98/6
Green Peggies 12 in. to 8 in. long		87/6

Cuttings—Eaves	Per Foot Run Equal 1 foot super
Edges and abutments	Equal 1/2 foot super
Ridge tiling	1/10
Fixing soakers	9d. per dozen.

CARPENTER.

Flat boarded centering, per yard super	5/-
Centering to beams, per yard super	7/-
Centres to arches, per foot super	2/-
Fir framed in carpenter's work per ft. cube	Plates 4/- Floor 6/- Roofs 5/10 Trusses 8/9
At per square	1 1/2 in. 1 in. 1 1/4 in.
Deal close boarding	31/- 38/- 43/-
Battening for slates	10/- 11/- 12/-
Roofing felt lapped and laid	12/- to 20/-
Gutter boards and bearers per foot super	1/-

JOINER.

Per square	1 1/2 in. 1 in. 1 1/4 in.
Deal plain-edged flooring	33/- 40/- 48/-
Deal tongued and grooved flooring	37/- 45/- 56/-
Deal matching	36/- 43/- 46/6
Sashes, per foot super	1 1/2 in. 1 in. 1 1/4 in.
Deal moulded sashes, divided in squares	1/10 1/10 1/10
Windows, per foot super	Very small Small Normal Large
Deal casd frames, 1-in. linings, 1 1/2 in. pulley styles, 2-in. sashes in squares, oak sill, double hung with pulleys, lines and weights	11/- 5/- 3/6 3/-
Doors, per foot super	1 1/2 in. 1 in. 1 1/4 in.
Square frame both sides doors	2/- 2/3 2/5
Add for each side moulded	2 1/2d. 3d. 4d.
Add for each side bead butt	4d. 4d. 4d.
Doors of hardwood such as oak or mahogany, will cost three times as much exclusive of polishing.	
Staircase.	
1 1/2 in. Deal tread, 1-in. riser, fixed complete per foot super	2/-
2-in. Deal strings, per foot super	2/-
Housing steps to strings, each	1/-

SAVING OLD ENGLISH COTTAGES

ne fund, instituted by the Royal Society of Arts
assist the Preservation of Ancient Cottages, was
gurgated, last week, at a Conference over which
Prime Minister presided. The general sym-
y and goodwill of the community towards the
ety's Scheme could not have been more strongly
ifested than by the presence of the Head of the
ernment and of the First Commoner; and
Whitley, who "spoke as a townsman," slyly
nded Mr. Baldwin of their unusual relation, and
he fact that he had placed himself in the position
eing called to order or having his speech abbrev-
ed if the Premier so willed. The speech in
h Mr. Baldwin appealed for public support was
icularly felicitous. "We want," he said "to
erve old houses, not as curiosities, but to bring
n back into the main stream of the national life.
want to see them made adequate for people
ay. We want, as wise people always do, to
a *via media* between, on the one hand, that type
rural despoiler who is never happy unless he has
ed himself in a vulgar villa, and, on the other
l, the kind of fanatic who is a fanatical restorer
who pins his faith to a spurious antiquity." He
ed the growing public sensitiveness to the harm
e by the vandal or the jerry-builder; and,
ough the great majority of the public might not
sensitive, he took comfort from the fact that
le were beginning to learn that it does not make
ilding ugly. "Through that," he added, "you
hit many consciences which will never be
hed æsthetically." He referred to William
ris' dictum about "staining wall-papers with
ry . . ." "No one," declared the Premier,
n say that we have stained *buildings* with poetry
the last two or three generations. We have
ed them with prose, and pretty bad prose at
." In graver vein, he referred to the value of
local tradition, "the adaptation of local means
meeting local needs"; and to the necessity for
ving craftsmanship, which has long laid dormant,
which he was certain might spring again into
le being throughout the length and breadth of
land. The formal resolution, which was sup-
ed by Lord Crawford and Sir Alfred Mond, in
dition to The Speaker, was carried unanimously.

The exact object of this Fund was not very clearly
explained at the meeting, but we understand that it
is intended to assist the working of the Housing
(Rural Workers) Act, 1926, by enabling the Society
to give disinterested advice to local authorities on
the manner of preserving old cottages which will
benefit by the Government Subsidy under that Act,
and to give contributions from the Fund in all other
cases. It would be ungracious to criticise at this
stage, before the Society has got to grips with the
problem; but we think it will be found difficult to
draw any hard and fast line between cottages
reconditioned with the assistance of a Government
grant, and others refitted at the owner's expense.
Local authorities will feel constrained to limit the
expenditure of public money to the bare require-
ments of structural stability and sanitary fitness;
and the addition of a £5 or £10 note might mean all
the difference in the æsthetic result. Probably,
with a little experience in working, it will be found
desirable to consider each case on its merits. With
the Circular, just issued by the Ministry of Health
(H.M. Stationery Office, price 2d. net) explaining the
general scope and objects of the Housing (Rural
Workers) Act, nothing but praise can be found. It
points out that the Minister relies on local authorities
to make suitable arrangements in carrying out
schemes as will prevent the disfigurement of build-
ings and will secure that so far as possible the
special character, beauty and fitness of these buildings
for their surroundings will be maintained. It goes
on to emphasize the desirability of following local
tradition in building, and of the importance of skill
and care in carrying out repairs; and exhorts
authorities to co-operate with some voluntary
advisory committee or panel, or to appoint an
architect to advise, who has knowledge of the locality
and experience of the kind of work contemplated.
There are critics of the Royal Society of Arts
Scheme, of course. Mr. G. K. Chesterton, more in
sorrow than in anger, doubts whether country
cottage architecture can be revived without the
spirit of mediæval craftsmanship that inspired it.
That is fundamentally true, no doubt, but rather a
misconception of the present problem, which aims
at the preservation of surviving examples and not

the creation of sham imitations. Though he supports the Society's movement, he thinks "it will have to cover a whole lot of things beside cottage architecture." Miss Ellen Wilkinson, M.P., as a representative of the extreme political left, is savage about the Society's proposal, which she conceives is designed to patch up exteriors of dark, insanitary and inconvenient dwellings, to look pretty for the

motor-car folk as they pass by. "The new municipal houses," says she, "may not be pretty, but they give light, air and space to the women who work in them." Which seems to argue that Miss Wilkinson knows very little about the minimum floor areas which govern most of our new housing schemes, and still less about the old country cottages which she so categorically condemns.

Notes and Comments

A Post War Evil

From remarks which Sir Alfred Mond let fall at the Royal Society of Arts Conference on preserving Ancient Cottages, the "destruction of the countryside," through the erection of ugly new dwellings is not a phenomenon peculiar to this country. A recent visit to the Riviera had disclosed to him a similar spread of vulgar and pretentious villas on the outskirts of most of the picturesque towns and villages; and he opined that, if it continued, this part of the Mediterranean littoral would lose the beauties which have so long lured the foreigner to their contemplation. In *The Observer*, of last Sunday, Mr. Boyd Cable tells us that Seville is being rebuilt in such a recklessly and artistically ruinous fashion that if the "progress" which this represents continues, at the present rate, for another year, intending visitors will have to hurry to get a last look "at that beautiful old Seville we have loved so long." Nor does the New World seem in better case. A well-known English architect, who has lately returned from a tour in America and the Far East, tells us that nearly all the modern buildings in Japan are pretty bad, and that in the United States, outside the big centres of skyscrapers, town-planning and efficient plumbing, to which most visitors confine their attention, conditions are even worse. In his opinion, even the worst of our factory towns can give points to many of the minor American towns and villages. Some towns in which he foregathered, *mirabile dictu*, could not even boast a bath! Well, all this ought to make us more pleased with our own land, and more determined to preserve the best of it.

Halicarnassus

As one of the seven wonders of the ancient world, the Mausoleum at Halicarnassus, built by Queen Artemisia, in memory of her husband, about 350 B.C., has exercised a particular fascination for architects and antiquaries from the days of Wren and, particularly so, since its remains were unearthed by Sir Charles Newton in 1857. There have been innumerable conjectural restorations of it on paper since that date, and Mr. H. B. Walters, of the British Museum, gives particulars in *The Times* of yet another, arrived at after years of patient study on the part of Museum officials, and expressed in the more tangible form of a working model constructed to a scale of 1 in 40. This, as stated, is based on the results of prolonged study and research, in which the Department has had the advantage of the practical and technical experience of Mr. W. Pinker, its foreman of masons, while the model, the work of Mr. W. Stacey, the sculpture mason, has been prepared under the superintendence of Mr. F. N. Pryce, assistant keeper, and can be seen in the Mausoleum Room of the Museum. The surprising feature in this Museum restoration—Mr. Walters opines that it "may arouse comment"—is the Gothic arched entrance doorway at either end of the lower part of the building. The Museum authorities may have authority for this form, but one must

confess that it consorts a little uncomfortably with the rest of the structure. The other distinctive feature of the restoration is the curve of the pyramid roof. We have no doubt that architects and antiquaries will study the model with interest, and follow the reasons advanced for the variations from previous conjectural restorations of this famous building.

Herculaneum

Signor Mussolini has shown a sympathetic disposition towards the claims of art and antiquity, as well as a reasonable pride in the achievements of the great progenitors of the Italian nation. The exercise of his will, displayed beneficently in the measures adopted for the treatment of ancient Rome, has now ordered the excavation of Herculaneum, a step suggested by Professor Maiuri, Director of the Naples Museum. That museum, with its wealth of Pompeian relics ranging from false teeth to theatre tickets, already bears witness to the high degree of civilisation attained by Rome, even if measured by modern standards, but Herculaneum is expected to reveal even greater treasures than Pompeii. For one reason, the lava streams of A.D. 79 sealed the city more effectually than its ill-fated sister, whose lighter covering of loess ashes lent itself easily, both on the morrow of the disaster and subsequently, to the recovery and removal of valuables. The special species of tuff which lies over Herculaneum, by its texture and depth, has daunted both the despoiler and the investigator; and it is hoped that by its projected removal many problems which have puzzled the antiquary and the student of architecture will be solved. Necessarily, the work will be difficult and slow.

The Fetish of Stained Glass

Mr. Mervyn Macartney, in his lecture last week given to raise funds for the King's Roll Clerks Association, drew attention to the reprehensible practice of putting stained glass (and often it was not good stained glass) into the windows of the City churches which were never designed or intended to receive such decoration. The result had been to make some of the churches so dark that it was impossible to see anything without artificial light. He thought it was a "fetish." Of the six "dome" churches of Wren, Mr. Macartney thought St. Stephen's, Walbrook, one of the most wonderful compositions ever evolved. To St. Martin-le-Bow he ascribed the finest spire, and to St. Vedast Foster Lane, the most graceful steeple. We are afraid that the fetish, of which the distinguished architect complained, is due to the convenience with which stained glass can be employed for a memorial, or as a means for the faithful to contribute to the "decoration" of their favourite place of worship. In the place, which is the immense window space of the Gothic Cathedral, stained glass can be a very beautiful thing. For stained glass, at, perhaps, its worst, one might visit the little church of Kilndown, Kerry, which represents a flight of private benevolence during the Gothic Revival.

COMBE DOWN, BATH.

C. F. A. VOYSEY, Architect.

C. F. ANNESLEY VOYSEY

The Man and His Work—II

When Voysey in 1884 set up in practice on his own account, he being then—to be exact—in his twenty-fifth year, he did so in the blind faith that was justified many others in taking that step, deterred by one small commission. This was for a little house. It was never built, because the builder's estimate was too high, or, possibly, because the architect's was too low. At any rate, the proposal fell to the ground, and I have to exhibit a young architect, newly married, with no work nor any prospect of work to come, who, according to his own accounts, had no definite architectural ideas to market, no sense of any individual point of view or of anything within which clamoured, or even reached out, to express itself. He had at that time designed no fabrics or blueprints, nor had it ever occurred to him to engage in such work; and he had, with the one abortive exception above mentioned, designed no house or other building, all such attempts having been directed to simulating the ideas of those who employed him, which is a very different matter from finding your own ideas and accepting responsibility for your own creation. One active step only did he take to establish himself in practice, and I mention it because, so far as my knowledge or imagination can inform me, no other architect in the history of the world has even taken that particular step: he intended to restrain his father from writing to family friends and well-wishers in the interests of his newly-constituted architect son. This is exactly the kind of tangential action his friends are never surprised to find in Voysey; but there was nothing Quixotic in the step he took: he had his usual logical reason for what he did informed by a deeper wisdom than directs the conduct of most young men, or of old ones either, on that matter. Voysey's sense of the position could be that it is the Almighty who rules, and not

Man, and that it was his part, as an architect, to take his chance, perform to the best of his ability what he was called on to do, and abide by the good or bad fortune which came to him. That would be his wisdom; his logic would show him that a client chooses his architect because he likes the man and his work, and has confidence in his taste and discretion, and that being so, he will be likely to accept the advice given him and be satisfied with the results; but if he has his architect thrust upon him, or employs him to favour a friend or as an act of patronage, he will be likely to challenge his opinion on all points, and view the finished work only as a storehouse of regrets.

Thus, then, we have a very young man of seven years' experience as pupil and assistant, with no work done or to do, no connection to look to, no proof of any special capacity to express architectural ideas nor of ideas to so express, with a wife, an office, and the stark necessity of earning a living facing him. What result is to be expected? Such a case is of general interest, for there are at any time thousands of young men tempting Providence in the same kind of way, or spurring their courage to the adventure. I do not know what Voysey expected—he is not the sort of man who lives in anticipations; but he certainly never dreamed that in five years he would find himself with his whole energies absorbed in a considerable practice and fast approaching the time when he was to do his biggest and most important works with a rapidly increasing vogue, a growing fame spreading even to the Continent, and known as a man whose work signalled, not merely new ideas, but new principles and angles of view, and who was exerting a profound influence upon the designs of the younger generation of architects; yet this is precisely what happened. And how did it happen? The facts seem to me remarkable.

MOOR CRAG, WINDERMERE.

C. F. A. VOYSEY, Architect

As he had no work, Voysey entered for a competition. In this he had no such success as has marked the career of his son, Mr. Charles Cowles-Voysey. The competition was that for the Admiralty Buildings behind Whitehall. Voysey made the whole of the drawings himself, and the award was given to Messrs. Leaning & Leaning, whose design, translated into relatively imperishable brick and stone, now sets off the less prodigious, though not generally less esteemed, frontage of the Horse Guards; and that was that! It was then he was led by a quite accidental circumstance to turn his attention to wall-paper and woven fabric design, but of this matter I shall speak in another place. He almost at once obtained commissions for such designs, and it was this work that kept him on his legs during the first few years, and has employed him, in some degree, to this day. His first architectural design was of a castle in the air: a small house for himself. This house was never built, but the drawings were published in "The British Architect," and their publication led to a first commission—a private house in Warwickshire. That work led to other commissions for houses, and they in turn to others, and thus from his first executed design nearly the whole of his early practice derived.

It is very unusual in architecture for a man of thirty to hold first place in his own particular field of activity, and, so far as I know, quite unprecedented when due, not to any one signal achievement, but to recognition of individuality in design and originality in thought. To find a parallel we have to turn to instances of early literary eminence, which is more common because the vehicle of expression in literature does not depend, as does architecture, upon a special and elaborate technical education. Like Kipling and Dickens before him, Voysey dropped

plumb upon new ground which he had entirely himself, and which would seem to have been standing vacant until he occupied it. Thirty-five years ago, and for long afterwards, any number of technical journals which contained one of Voysey's designs was a memorable number which was eagerly passed from hand to hand among those in whose eyes the future of architecture reposed, and who were, it happened, the designer's contemporaries. A. G. Penty, in a recent article, paid tribute to the force of Voysey's initiative and the fruition of ideas in the present day vernacular of domestic architecture; and Mr. George Drysdale, in an address delivered by him a short time ago on Leonard Stouffer, told his hearers that the minute attention to detail which characterised that architect's work was due to his admiration for Voysey's methods. I do not refer to those acknowledgments to laud Voysey, but to remind those readers who are not old enough to remember the day when Voysey burst upon the scene that the thing which distinguished his designs was no mere matter of variations in the features and vogues of building at that time exploited by architects, but a new, comprehensive idea; a new addition to the subject, a new spirit, a new impulse. Those who can look back will recall not particularly the picturesqueness and the engaging sentiment and simplicity which distinguished Voysey's domestic designs in comparison with what others were then doing, but rather the freshness of the whole thing, the freedom from conventions, the closeness to reality, the intimate sentiment of home and of English domestic life. The neat, logical forethought shown in his plans was concerned not with what people were learnt to expect in a house, but with the practical needs of those who were going to live in it. Voysey himself disclaims that there were any direct

No. 24 OLD BOND STREET, LONDON.

C. F. A. VOYSEY, Architect.

principles which guided him to these results. He declares that he had none. He regards himself merely as a product of his times; what he did was, holds, the result of solving practical problems in the light of the general needs of the time and the particular requirements of his clients.. He does not say, but leaves it to me to point out, that he analysed himself by discerning what those needs were and in dissociating himself from habits of thought and conventions of arrangement which enthralled others. The fact that Voysey denies any directive principle in his work, and holds himself to be only the product of his times, does not alter the fact that the directive principle was there, and that if Voysey was a product of his times, his times, exemplified in the architecture of small houses, were a product of Voysey. The directive principles involved were, in fact, Voysey's own unconquerable and most unaccommodating prejudices; and it is because the directive principles were thus an instructive impulse, and not assumed, that he is unconscious of them: the thing that it was natural for him to do appears to him to belong to his times; because it was the result of his reaction to the times; that the thing it was natural for Voysey to do was very different from what it was then natural for others to do who were facing the same problems, and who also were products of their time. The fact that a large number of Voysey's architectural ideas and devices, and the whole body of the teaching which his work represents, have been assimilated into the daily practice of architects throughout the country, and has established with them an intimate relation of detail which previously did not exist, does not mark Voysey's ideas as being so much a product of his time as instructive and reformatory of his time. It is not to say the characteristic features of Voysey's designs have been perpetuated; his individuality is so strong that any attempt to imitate

him is to produce a work which will at once be challenged as a reproduction, and it is in the much more important matter of fundamental principles that his influence reigns. An exception has, however, to be made in the case of a firm of London upholsterers and furnishers, who caused a model of one of Voysey's houses to be made from published drawings, and set up in their showroom to enforce a tempting offer to customers to build, to the esteemed order of any of them, a "Voysey house." I will mention that this matter has been in my knowledge for many years, and was not referred to by Voysey when I pumped him for the purpose of these articles. In the next number I will say something of small house design as Voysey found it, and as he left it.

Mr. Fred. Rowntree, F.R.I.B.A.

We regret to record the death of Mr. Fred. Rowntree, of 11 Hammersmith Terrace, W.1, where he practised in partnership with his sons, Mr. Colin Rowntree and Mr. Douglas Woodville Rowntree. The late Fred. Rowntree, who was 66, was articled to C. A. Bury, of Scarborough, afterwards serving as an improver in the office of Edward Burgess. His professional work covered a wide range of buildings, among them being (in conjunction with his sons) the West China Union University at Chunan. Of buildings carried out by him alone, may be mentioned Bootham School, York; The Mount School, York; Arleton College, Scarborough; science buildings at Doncaster Grammar School; and the Scottish Temperance Life Assurance Buildings, Cheapside, London. As a member of the Society of Friends, he had designed most of their meeting houses and schools during the past 30 years. Mr. Rowntree during the Great War devoted himself wholeheartedly to the work of helping disabled soldiers, of which the Enham Village Centre remains as a permanent development.

MODERNISM

Professor Worthington's Address to Students

The R.I.B.A. Annual Address to Students was delivered by Professor J. Hubert Worthington at the Royal Institute of British Architects on Monday last. Below we give some extracts:—

There are several things about an evening such as this that should be changed. First it should be a Closed House—Students Only. Then one could let fly with a comparatively easy mind. We did this with our recent lectures to workmen. Even builders were not allowed in—let alone architects. Secondly, the greatest deterrent to a frank and spontaneous “pi-jaw” is a fear of the Press, the thought that one’s inconsidered indiscretions may be brought to the light of day.

Let us consider that elusive question of what constitutes an architect.

The demands made of him are such that no mere man can hope to fulfil them all. If he could do so he would be a demi-god.

Our painter and sculptor friends, given the creative fire and a reasonable amount of study, can prove their genius to the world. But unless you have an “uncle” or an “aunt” to give you a job, how can you show your talent? Paper counts for nothing. And when you begin you are expected to combine artistic genius with technical ability, creative impulse with conscientious drudgery, temperament with control. You must satisfy the man in the street by your constructive power, your human understanding, your convenient planning, your organising efficiency, and you must satisfy the artists with your skill as an imaginative designer. You must combine the spiritual and the material in a degree far greater than in any other calling. Art and business, fire and forbearance, interest and permanence—who is the man who can claim to possess the happy mean between these conflicting elements? In the architect an extreme of any is equally disastrous.

If you have the soul of an artist, you will be considered a most infernal nuisance. You will not be condoned as our brothers in the sister arts are condoned. It is considered rather an advantage to them to have side whiskers and big black hats, and to be “So naughty, you know!”—but then he’s a genius.” Whoever brought his thrifty savings to a “genius” to build him his little house? No, you will be continually up against the world. You will know stinging pain and bitter disillusionment, and a sense of loneliness and failure. You will be misunderstood, and often your most cherished dreams will be ridiculed and laughed to scorn. A thick skin is one of life’s great blessings, but it won’t be yours.

Yet the architect’s calling has in it the opportunity to do great imaginative work that is fully equal, in the world of the spirit, with that of any painter or any sculptor—in spite of the drains and calculations and quantity surveyors and sanitary inspectors that dog your path from the cradle to the grave. Equally with any artist you deal with the ultimate and eternal values.

But remember that if you have had the vision, the dream, and failed to be true to the light that has come to you—if you chuck up the sponge and desert the straight and narrow way for the easy road, then that is hell. Architecture is a mission, not a mere form of livelihood. But the chances are that the other side pulls you more strongly than this artist side.

Have you the mind of the practical man, the business man, the efficient man, the success at any price man? If so, you will find life very much easier, but you won’t necessarily be a success in the artist’s sense. You are badly needed, and you’ll be very useful in the world, you’ll be a good fellow

and make an easy husband. But if you are strong on the material side of our most complex calling, don’t take in seven other devils like yourself and fabricate a fortune. Try and realise your limitations, bring your tame “ghost” into the light, take unto yourself a partner that will supplement your sterling if somewhat humdrum qualities, and give a chance to one of those brilliant young artists with creative fire and genius who are helpless alone, who want a nurse or a strong yet sympathetic partner to guide their complex temperament to achievement, both for your own reputation and for the sake of the world.

When Mammon comes in, Art goes out.

“Modernism” is a word that many of us consider synonymous with Bolshevism, but we must face this controversial topic that divides the art world into such disastrous factions.

And we must look at it from the Architectonic standpoint. The new Progressive spirit of the age cannot be waved away with a “die-hard” gesture. We cannot sit for ever like old colonels in a club. In religion, in politics, and the whole realm of ideas there is an irresistible change going on. We are afraid of what we do not understand, and the less we understand it the more we rant against it. But there is something there. It cannot be suppressed nor should we wish to suppress it. If it is vital and progressive we should rather try and guide it.

Give your modernism a relish of human common sense. Only palatable food is digestible to a sensitive stomach. The architect works for the big human world, not for an exclusive set of abnormal and precious aesthetes. Architecture moves necessarily and rightly at a slower pace than the other arts. You build for centuries, not to satisfy a passing whim or the claims of the latest movement. A building is “up for keeps.” What a thought! It cannot be put in the cook’s bedroom when we grow tired of it.

This should have a sobering influence on excessive zeal to be clever. You can have a bit of fun with scenery, an exhibition building, a shop front for powder puffs and camisoles, or a jazz night club, but if you are putting up a church or a law court, or an addition to an Oxford college or a public school, you must give your design the quality of the eternal.

Give a “Bolshy” sculptor an important job on a public building, and the chances are he’ll become as sane and sober as a Labour M.P. with Cabinet responsibility.

If your so-called modernism is sensational, restless, full of æsthetic excitement and “out to tickle tired eyes,” to use a phrase of Professor Lethaby’s; if it is self-advertising, egotistical, non-co-operative and un-English; if it is precious, abnormal, ephemeral and inhuman, chuck it. But if it is logical, harmonious and well composed; if it is well planned and well constructive and co-operative and English; if it is sane, masculine and unaffected and human and endowed with the quality of the eternal, let us have it.

But you cannot give a message till you have got one to give. You must have technique as a vehicle for giving it. Forced originality is the witness of a weak, uncultured, immature mind. Great art is never forced.

Never make your so-called modernism an excuse for sloppy technique, to cover up an incapacity to design, to draw, to carve. It’s pure humbug.

At the close of the proceedings a vote of thanks to Professor Worthington was moved by the Rt. Rev. Charles Gore, M.A., D.D., and seconded by Mr. R. F. Cholmeley, Chairman of the Head Masters’ Association.

PARK LANE HOTEL, LONDON.
MESSRS. HENRY TANNER, Architects.

THE PARK LANE HOTEL, LONDON

This important new building, designed by Mr. Henry Tanner, has been visible in skeleton form for several years, and its owners are now to be congratulated upon having overcome the difficulties which lay in the way of its completion. The building as it stands shows a somewhat striking contrast with its neighbours in Piccadilly, but in a time of transition like the present, when so many famous architectural landmarks are being removed, one is not entitled to demand that harmony and neighbourliness which should characterise groups of buildings which over long periods are destined to be contemporaneous. At the immediate right of the Park Lane Hotel is the delightful building once the town house of Lord Sebery, now occupied by the Savile Club, and this too is to be demolished in the near future. When other buildings in its vicinity have been replaced by structures of a larger scale than themselves, it will be time to consider what will be the values of the architectural ensemble of which the Park Lane Hotel is a part. At present it must be observed that in scale, in material, and in colour it appears somewhat of an intruder in the historical site it occupies. It is noticeable, for instance, that the

dimensions of the building, and especially of the columnated ground-floor storey, prevents the building from entering into intimate formal relationship with its neighbours, while the glossy texture of its walls also strike a note of innovation. It is in the tiled roof, however, of which the bright orange colour contrasts violently with the surrounding expanse of slates, that the building expresses its determination to be different, one might almost say aggressively different, from the buildings next to it. There is no need, however, to take the colour discord too seriously because, in the first instance, the London soot will rapidly tone down the bright orange to a dark brown or even a black, while, of course, it is not impossible that in time to come the neighbouring buildings as reconstructed will conform to the model which has been set up in the Park Lane Hotel. In the case of the walls, we may be grateful for the decision of the building owners to give these a white or cream texture, which even when slightly soiled will to a certain extent harmonise with the various greys of the other façades in Piccadilly. Had the proprietors desired to separate the structure still more emphatically from its neighbours they could easily have made the walls

PARK LANE HOTEL, LONDON.
MESSRS. HENRY TANNER, Architects.

of terra-cotta colour. Or, indeed, as the artificial material with which the façade is faced lends itself so easily to colour treatment, they might have made the walls blue or green or pink or any other tint which the fancy might suggest. Perhaps, however, such an architectural development as this is reserved for the future, and we may expect our modern hotels to display ever more and more daring architectural innovations by which they will attain a spectacular prominence.

The Park Lane Hotel presents towards Piccadilly a façade of which the principal characteristic is its division into two prominent wings with a deep court or cavity dividing them. In the ground-floor storey only does the façade bridge the gap and provide a unifying element by virtue of which we feel that the composition has a claim to be regarded as a single whole. The black marble columns, however, give to this ground-floor storey a dignity and importance which help the composition considerably by providing a bridge between the two symmetrical pavilions on either side. Whether the unity of the façade would have been aided if a tall columnar screen had been erected above the ground-floor storey is an interesting problem. There can be no doubt, of course, that the present arrangement of the plan was determined by utilitarian considerations, for by means of it the maximum number of the occupants of rooms are enabled to obtain a view, if even an oblique view, of the Green Park, while the various apartments are given the maximum of lighting and ventilation which the site permits. The side and back elevations show an orderly array of windows forming a repetitive pattern which suggests efficient planning somewhat in the American manner. But it is the Piccadilly frontage which is the most important, and it will here be observed that space has been found for a

promenade of attractive shops which are kept low that the arcade between the columns should retain its proper architectural value. This part of the composition is very skilfully managed, for it would have been so easy, unless especial care had been taken to avoid this solecism, to have allowed the entablature over the shop windows to cut the height of the columns exactly in two, thus defeating the aesthetic intention of the Order, which, of course, was to give unity to the first and principal stage of the building. Above the entablature of the Order is a balustrade which serves as a decorative terminal to the lower part of the composition, while above it the fenestration of the wings is arranged in three columns of windows, which form an interesting pattern. The illustration shows that Mr. Tanner has taken great pains to give to the fenestration of the hotel point of accord with that of the existing building on the left. It is observable, for instance, that the level of the cornice above the Order roughly corresponds with the line of segmental pediments above the first-floor windows of that building, while the main cornice of the latter is taken up by the bracketed hoods surmounting the second row of windows above the balustrade of the hotel. In this case the architect has even indulged his desire to pay deference to the old building to the extent of somewhat impairing the unity of the hotel façade, for it must be confessed that the strong horizontal line of these bracketed hoods exactly cuts in two the vertical dimension between the main cornice and the balustrade. Again, it will be observed that the subsidiary cornice above the attic of the neighbouring building is taken up by a group of string course mouldings in the hotel, which certainly helps the composition but is unfortunately not quite strong enough to overbear the powerful line of the bracketed hoods below them. Above the main

PARK LANE HOTEL, LONDON: THE VESTIBULE.
MESSRS. HENRY TANNER, Architects.

PARK LANE HOTEL, LONDON: THE BREAKFAST ROOM.
MESSRS. HENRY TANNER, Architects.

cornice of the hotel is an attic storey surmounted by a tall hipped roof with double rows of dormers, of which the central one of the lower row is built in stone, surmounted by a heavy curved pediment and by means of a massive architrave incorporated with the central window of the attic beneath.

The planning of the building is excellent. Every provision has been made for the comfort of visitors. It is noteworthy that this is the first hotel erected in England in which every bedroom has a separate bathroom attached. Special care has been taken to provide facilities for motorists. Near the Brick Street entrance is an annexe of the hotel comprising complete accommodation for cars and chauffeurs.

The entrance hall is a large chamber treated in the classic manner with Ionic columns supporting the ceiling. This gives access to the old Roman Lobby Lounge, a long room top-lit of which the wall surface is broken up by occasional pilasters and panels. Several of the other rooms are decorated in "period" manners; for instance, the Old English Breakfast Room is partly half-timbered and is further decorated with antique oak panelling, Jacobean tapestries, and shields of heraldic design. The floor is tiled and an old open fireplace is installed, while the furniture, which includes several old settees, is oak. The illumination of this room is artificially devised to give the illusion of morning sunlight. Other rooms include a French Restaurant, a Smoke Room, which is an exact reproduction of the old Globe room at the Reindeer Inn, Banbury, a true example of Tudor architecture, a ball room with a spring floor and ample space for spectators around the essential portion used for dancing, and a Grill Room in the Louis XIV style. All these decorative schemes are well executed in their respective manners, and there is no doubt that the visitors to the Park Lane Hotel will have opportunities of indulging a variety of architectural moods.

Messrs. Higgs & Hill, Ltd., were the general contractors, and the following is the list of sub-contractors:—Ragusa Asphalte Paving Co., Ltd.—asphalte; Art Pavements and Decorations, Ltd.—Biancola work; Tredegars (1923), Ltd.—electrical installation; Ames & Finnis—roof tiling; Express Lift Co.—lifts; British Vacuum Cleaner and Engineering Co., Ltd.—vacuum cleaning plant; Emerson & Norris, Ltd.—cast stone; Kleine Patent Fire Resisting Flooring Syndicate, Ltd.—floors; Leeds Fireclay Co., Ltd.—the material used for the main façades is Burmantoft's Marmo-Faïence, a permanent fire-resisting, matt-surfaced, ivory-tinted terra-cotta manufactured by this firm; Shanks & Co.—equipment for all bathrooms; Dent & Hellyer, Ltd.—plumbing and drainage; Wotton & Son, Croydon—metal casements; Sturtevant Engineering Co., Ltd.—granite tubes; Bromsgrove Guild, Ltd.—ornamental ironwork; J. R. Pearson (Birmingham), Ltd.—staircase balustrading; Richard Crittall & Co., Ltd.—heating, ventilating and hot water; Comyn Ching & Co., Ltd.—metal working; Benham & Sons, Ltd.—kitchen equipment; Plastering, Ltd.—solid plastering; Lightfoot Refrigeration Co., Ltd.—ice-making and cold stores; Morris Westminster Guild—ornamental daylight and roof lights; Diespeker & Co., Ltd.—patent bronze metal doorposts, etc.; Patent Victoria Stone Co.—Granolithic staircase; Docker Bros., Ltd.—Induroleum flooring; Roberson's, Ltd.—work in connection with the grill room; Harrods, Ltd.—decoration for old English breakfast room; Hamptons, Ltd.—bedroom furniture; Magneta Time Co., Ltd.—electric clocks; Smith Walker, Ltd.—alterations and additions to original steel structure; T. H. Sankey & Son, Ltd.—partition walls ("Fosalsil" partition block); Roberts Adams—floor springs; Carter & Co. (London), Ltd.—floor and wall tiling.

Correspondence

To the Editor of THE ARCHITECT & BUILDING NEWS.

SIR,—I yield to no one in my admiration of the pioneer work done by Voysey in breaking loose from "The Battle of the Styles" not by introducing one of his own, but by the example of actual work helping his contemporaries and successors to get back to first principles. Why should the writer of your article make Voysey the peg on which to hang a general attack on the present-day schools of architecture in the phrase "Voysey suffers in the general fatuity induced by the schools of architecture where to be trite and dull is a recommendation to minds which cannot be bothered to think and feel, etc." This phrase may be good journalese, but it is utterly out of place in an article upon the life work of a distinguished architect, and, further, if analysed it means absolutely nothing. Neither Voysey nor any other architect whose reputation was made before the schools established the position they have reached to-day can have suffered anything from the supposed general fatuity, whatever that may be. And again, what has Voysey to do with minds that are trite and dull or cannot be bothered to think and feel, and in what justification does the author of this article base these ridiculous assumptions?

Having seen as much of the schools of architecture in this country as almost anyone, and having studied their students and their problems very closely, I cannot let these comments upon them pass without pointing out that there is as much imagination and capacity to think and feel among the students of to-day as there has ever been. The great asset these students have now is that their thoughts and feelings are harnessed to an adequate vehicle in charge of capable drivers to direct their early efforts.

The writer of your article is evidently one of those who likes to put the vehicle before the horse, but why drag in Voysey? who is, and was, both horse and cart in one.—I am, Yours faithfully,

MAURICE E. WEBB.

Competition Notes

Modern Furniture Designs Competition

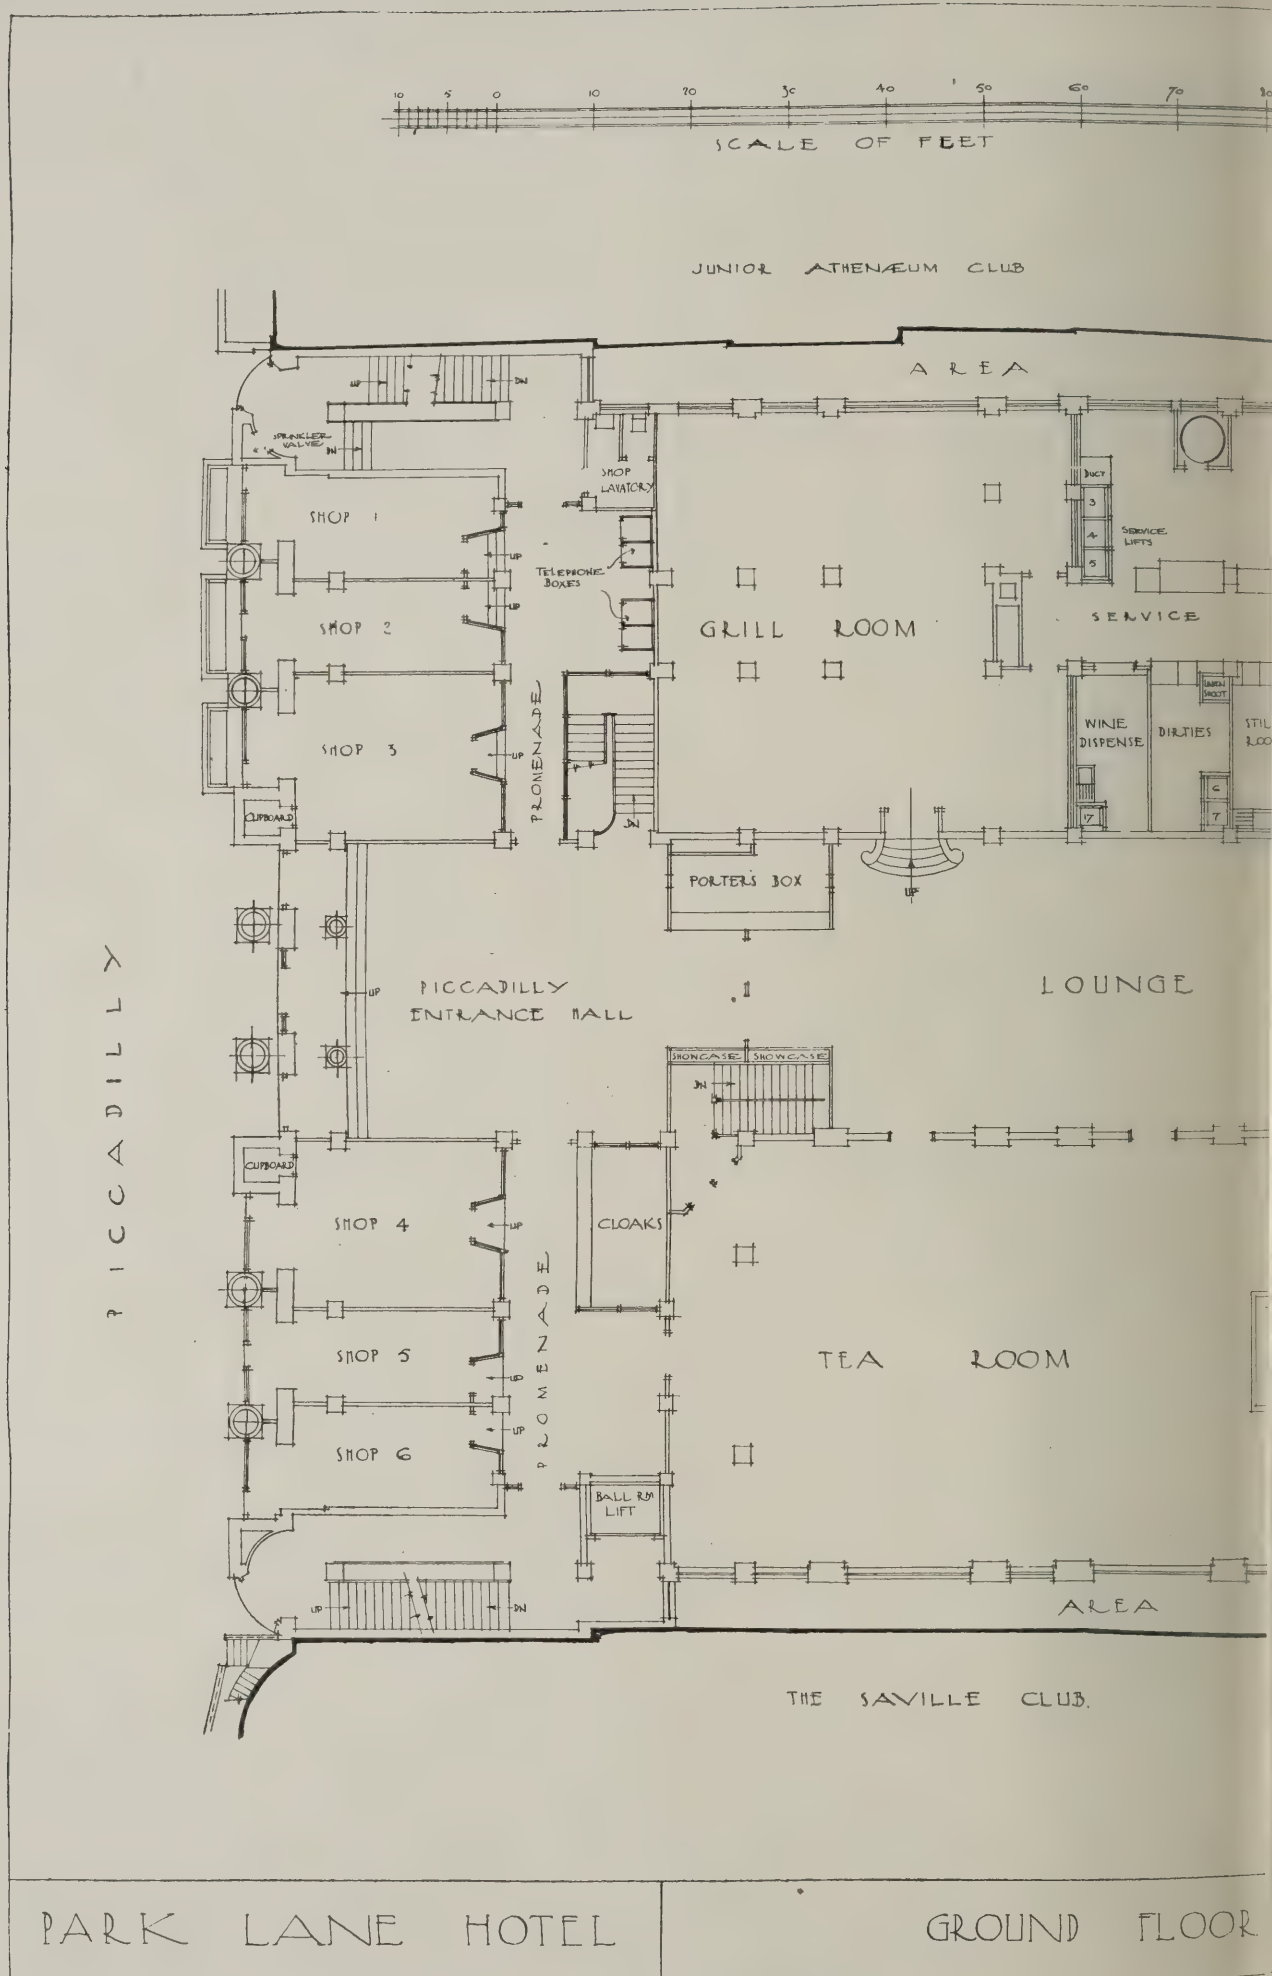

The following awards in the preliminary part of this competition have been made by the assessors:

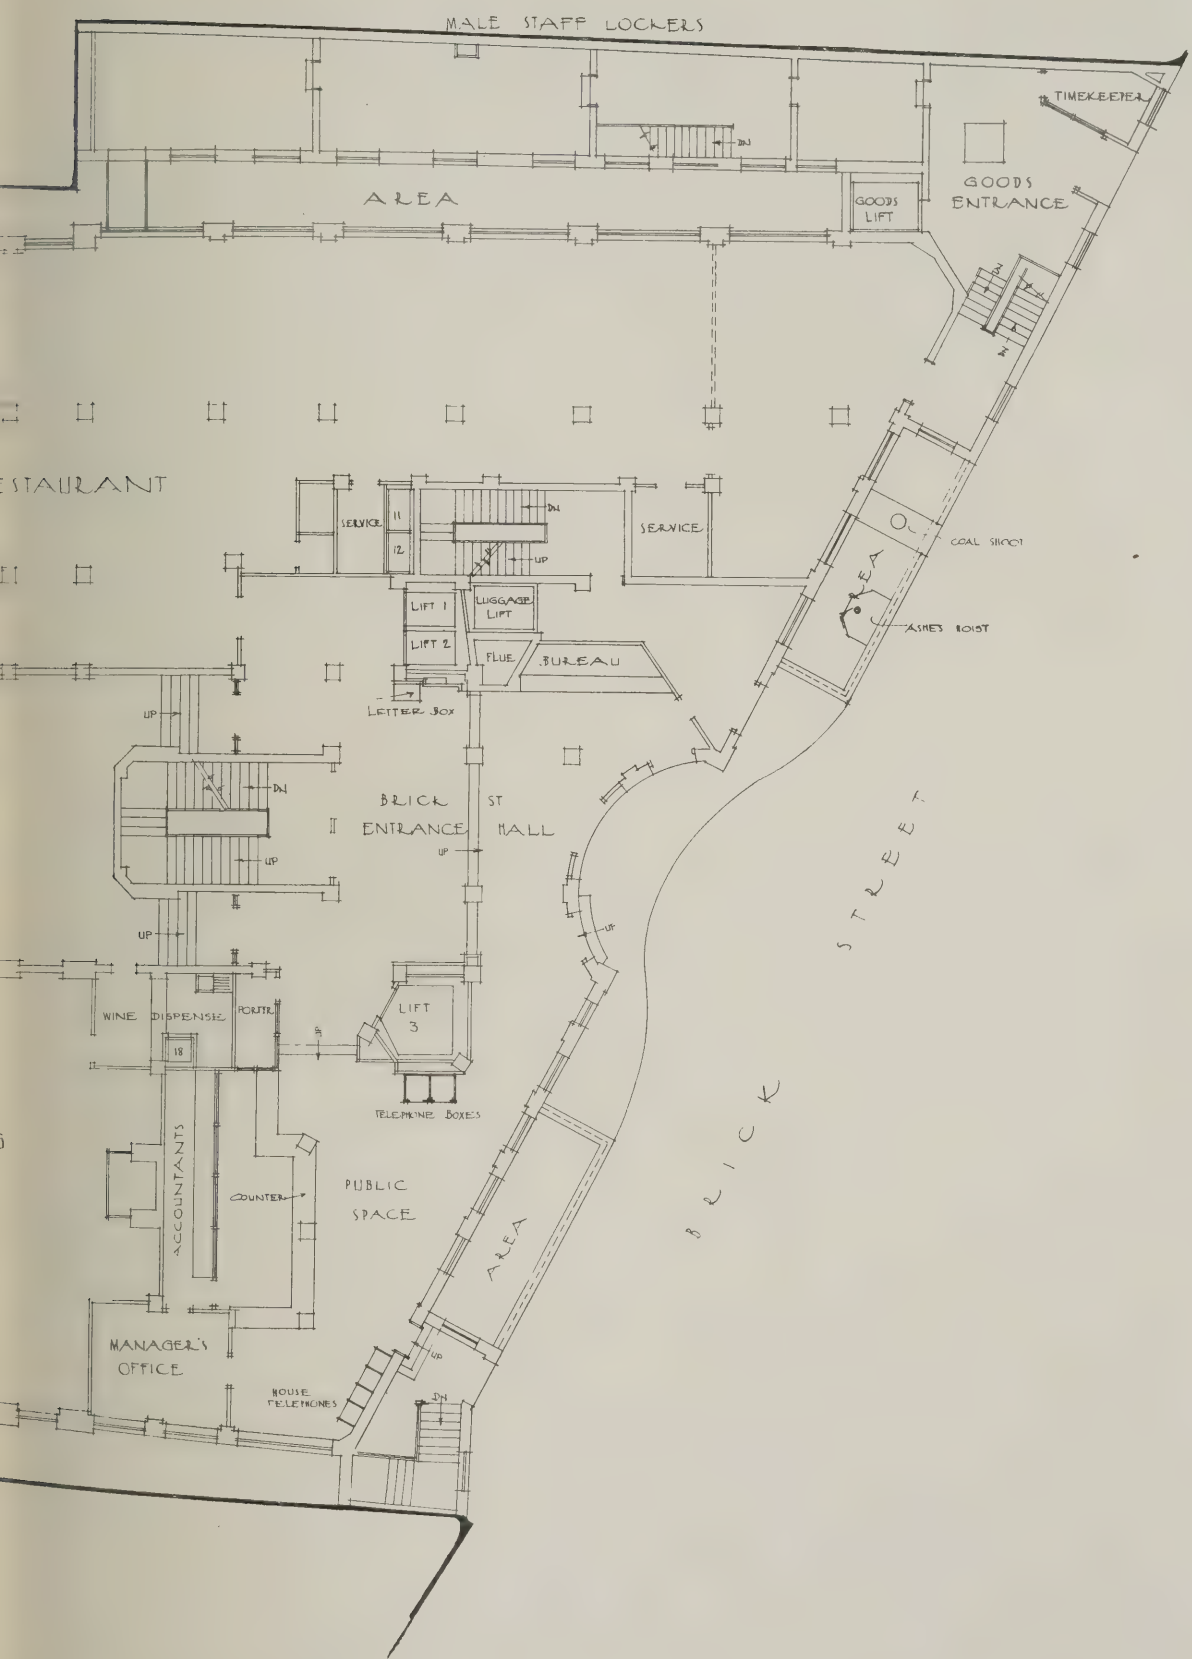

Section A. Designs for the Complete Furniture for a Double Bedroom.—Prize of 25 guineas to "Triangle," Mr. Thomas S. Tait, F.R.I.B.A., 48, Rothewick Road, Golders Green, N.W.11. 25 guineas to "Michael Dawn," Mr. L. Scott-Cooper, Rest Harrow, Biddenham, Beds. 25 guineas to "Ren-yats," Mr. Albert Stayner, 5 Humphrey Street, Higher Crumpsall, Manchester. 25 guineas to "Arts Decoratifs," Mr. Joseph Emberton, A.R.I.B.A., Chesham House, 150, Regent Street, W.1.

Section D. Designs for the Complete Furniture of a Dining-room.—Prize of 25 guineas to "Gorenflot," Mr. A. Leslie Osborne, 63 Barmouth Road, Wandsworth, S.W.18. 25 guineas to "Michael Dawn," Mr. L. Scott-Cooper, Rest Harrow, Biddenham, Beds.

No prizes were awarded in Section B (designs for the complete furniture for a drawing-room); and C (designs for the complete furniture for a sitting-hall).

We regret that in our issue of January 21 the name of Messrs. Carter & Co., Ltd., was omitted in connection with Mr. Harold Stabler's lecture at the Architectural Association on Glazed Sculpture. The example illustrated was carried out at the Poole Potteries of Messrs. Carter & Co., Ltd., and Carter, Stabler & Adams, Ltd.

NEW NEEDS AND MODERN NOTIONS—V.

By EDWIN GUNN, A.R.I.B.A.

COOKING AND HEATING.—In much the same sense as the heart is the centre of the human body, the kitchen range or its equivalent is the centre of the house. The old kitchen range has passed; its usually inadequate and mysterious boiler, and the uncertain brick-setting which left success or failure so largely in the hands of workmen who might be careless or stupid, are chiefly responsible; for no one denies that it looked better than any of the currently fashionable associations of boiler and gas cooker, or

Fig. 10.

that at its best it cooked reliably and well. In its place we have usually in the small house either separate boiler and gas cooker, or one of the combination appliances.

The boiler and cooker placed side by side in a recess, which is the usual practice, do not, as a rule, present that well-ordered appearance which established things assume when the experimental stage is past, and they are apt to leave crudities and raw edges, which further experience will no doubt serve to mitigate. There are, for instance, certain things to be provided for which are not always happily managed. The nakedness of the appliances is certainly reduced when they are housed in a recess, though such a placing renders it a matter of difficulty to clean out the space behind, which accordingly is apt to become filthy with greasy fluff and dust. In such positions I favour a square type of boiler which may be bricked up to the level of the hotplate on the side and one end, closing in the most inaccessible space, conserving heat, giving an extension of hotplate space, and, incidentally, economising glazed tile linings, which may start from hotplate level (Fig. 10).

Though by the use of "smokeless" fuels chimney sweeping is reduced to the minimum, it must yet be provided for, as even if soot does not accumulate, flue dust will, and its periodic removal is essential. This generally means a soot door, and chimney sweeping through a soot door is apt to result in stains and smudges on the surrounding decorations. It is a convenient practice to plan the boiler recess so that it adjoins an external wall, and to carry the brick flue down to floor level with a soot pocket, placing the airtight double soot door externally, so that chimney sweeping is done from outside (Fig. 11). This also reduces to the minimum the exposed length of iron flue-pipe which connects the boiler to its chimney.

Drainage of the boiler and hot water system is another thing which must be provided for, and this is not most conveniently done by the provision of a draw-off tap at the base of the boiler, which from the nature of things is so low that only the shallowest vessel can be placed beneath it. Where a boiler is in a stokehold, rust-stained hot water may no doubt be run out over the floor to a gulley or sump without offence, but in a kitchen this is hardly popular! With a boiler in the position shown in Fig. 11, it is a simple matter to connect a length of tubing through the external wall, which, with a plugged tee outside the

house, permits periodic flushing of sediment to take place free from mess.

RADIATORS.—Apart from the thorough-going central heating system, in most small houses where an efficient hot-water boiler exists it is possible to extract increased value by making it run a couple of radiators, which can generally be done at slight additional initial cost and without extra running expense. Such radiators must not involve long runs of piping and should not be relied on to do more than supplement other heating provisions, but they usually work quite simply and beneficially if installed one above the other in the dining-room (which probably adjoins the kitchen) and the bedroom over it. As the kitchen probably faces north or east, these rooms presumably also have a north or east wall, against which a radiator is a welcome provision. In some districts no ill effects result if the radiators are on a separate loop from the boiler, using the same water as the domestic service, but in other places rust-stain would arise in the domestic supply unless the radiators were severed therefrom, and it will then be necessary to adopt the indirect system, with some increase in cost and complication—offset by longer life in boiler and pipes and less fluctuating temperatures.

CHIMNEY.—A flue from a domestic boiler differs in requirements from one suitable to an open fire. It may be lower with advantage, as a flue of sufficient height to ensure steady draught to an open grate is apt to pull so strongly on the exactly controlled coke boiler that it becomes difficult to regulate the air supply down to the point at which all-night burning

Fig. 11.

can be relied upon when cold weather encourages rapid draught. I have found that a flue 6 feet shorter than the ordinary chimneys is about right, and this can quite well be grouped with flues from bedroom gas fires, which it will serve to keep dry. To prevent down draught from adjoining roofs a flue cover is advisable; the old device of a length of half-round ridge tile supported on stilts formed by two courses of bricks at the sides (but open at the ends) is quite effective and keeps the flue dry when the boiler is not in use, so ensuring an easy start on relighting after a summer lapse.

New Ways and Means

*The Editor will welcome early information of
New Plant, Materials and Fittings*

Kitchen Range equipped with "Filma" Oil Burner.
(Filma Oil Burners, Ltd.)

Oil Fuel for Domestic Service

Apparatus for the application of oil fuel in domestic service, both for kitchen ranges and for central heating boilers, has been placed on the market by Messrs. Filma Oil Burners, Ltd., of 4 Broad Street Place, London, E.C.2. This oil-firing gear can be installed in existing boilers without any material alterations in the construction of the latter, electric current (approx. 250 watts per hour) being used to keep the apparatus in operation. The burners used are noiseless, and have none of the "roar" generally associated with the working of oil-fired furnaces. They have also been designed to give complete disintegration and wide diffusion of the oil fuel, so as to eliminate the trouble met with in the earlier types of oil-firing gear, and to reduce attention to the minimum. In practice the thermostatic indicator is merely set to the required temperature, and the combustion of the oil is allowed to proceed. Our first illustration shows a kitchen range fitted with the "Filma" Burner, which is so arranged that it can be swung out from the combustion chamber to facilitate lighting-up. Our second illustration shows the "Filma" Oil Firing Unit used for central heating boilers of capacities ranging from 40,000 to 1,000,000 B.Th.U. per hour. This unit is entirely self-contained, and includes a 15-gallon cast-iron supply tank for the oil, a hand-pump for recharging from the main storage tank (or, as an alternative, a "gravity feed"), and an automatic temperature control. Mounted on the container is a small electric motor, which is directly coupled to a valveless rotary air blower, serving to blow the oil up to the burner and to atomise the fuel at the burner nozzle by means of the escaping air. The apparatus is lit up by placing a torch or a piece of burning oily waste in the furnace, and then switching on the electric motor. The burner instantly

ignites, and continues to operate, silently and smokelessly, so long as the motor is kept running. In case of motor or current failure, the oil ceases to flow and the flame is immediately extinguished. The size of flame in the furnace is under automatic control, and requires no manual adjustment, the apparatus for this control being mounted on the oil supply tank in conjunction with a pipe carried to the furnace, in which a thermostatic tube is placed. Rise or fall of furnace temperature thus operates the thermostat, which in turn controls fuel to the burner. The control chamber of the thermostat situated on the oil supply tank also carries a simple indicator, which may be set to any desired temperature. The "Filma" Burner itself has been designed to overcome the defects noted in earlier oil-firing gear by atomising the oil at a low velocity and diffusing the atomised oil through the whole of the air used for combustion. This atomising action is obtained by bringing the oil to the atomising point, not as a high velocity jet, but as a slow moving film. This film is made to fall in the path of a series of fine high velocity air or steam jets which, intermixing with the oil, carry it to a second row of jets, meeting the first at an angle of 90°. The impact of these converging jets shatters the oil film, producing a fine mist of atomised oil and steam or air particles, while at the same time it destroys all the velocity of the air or steam atomising jets. The cloud of oil particles thus formed drifts and diffuses in the incoming air, which is arranged to cross the path of the atomised particles at right angles. Combustion is thus instantaneous, and the flame formed by this means is intense in temperature and very low in velocity.

New Decorative Lighting Units

To meet cases where illuminating efficiency is of secondary importance compared with effect, as in hotel lounges, theatre foyers and dance halls, Messrs. Falk, Stadelmann & Co., Ltd., of Veritas House, 83-93 Farringdon Road, London, E.C.1, have introduced a series of coloured lighting units in which "cloudlike" effects are obtained by an intermingling of colour formed

in the manufacture of the glass. The colours used are warm and exhilarating without being bizarre, and although no two pieces of the glassware are identical in detail, the variation is not wide enough to become inharmonious. These "Cirrus" units are provided with a two-chain suspension fitting, known as the "Holdrite," which carries the entire weight of the glassware but allows the lamp bulb to be removed when necessary without disturbing the assemblage.

The "Robin Hood" New Senior Boiler.
(The Beeston Boiler Co., Ltd.)

A New Boiler for Central Heating

A new sectional boiler for central heating has been placed on the market by Messrs. The Beeston Boiler Co., Ltd., of Beeston, near Nottingham. This "Robin Hood" New Senior Boiler has a much larger fire pot than that of the older pattern, to enable the fire to be banked up for long periods without attention. At the same time, the overall height of the boiler has also been reduced, the new pattern measuring only 63 inches from floor level to the centre of the elbow flow. The sections are connected by short bolts to allow for free expansion and contraction, and the complete assemblage is tested to 90 lb. per square inch hydraulic pressure. The firebars are of special pattern with concave tops, and the smoke flue at the back is reversible, so that it can be used in either the vertical or the horizontal position. The boiler can be supplied with from 6 to 12 sections, giving a range of heating powers from 47,000 to 1,000,000 B.Th.U. per hour, or an equivalent of from 3,280 to 6,740 square feet of radiation surface.

The "Filma" Oil-Firing Unit for Central Heating.
(Filma Oil Burners, Ltd.)

Competition Notes

New Town Hall and Library, Leith

The following conditions and instructions are published in an abridged form for the benefit of architects who are desirous of competing.

(1). The Corporation of the City of Edinburgh invite architects, resident or practising in Great Britain, to submit, in open competition, designs for a hall and a library which it is proposed to erect upon an area of ground, being the site of the old North Leith Manse, north of Ferry Road, and lying between Junction Street and Madeira Street.

(2). PLAN OF SITE.—A block plan of the site, having levels figured to ordnance datum with a schedule of accommodation and conditions of competition and other relative information may be obtained on and after January 22, 1927, on application to the Town Clerk, with a deposit by crossed cheque of £2 2s., which will be returned to all who send in *bona-fide* designs in conformity with the conditions; or to applicants who decline to compete and who return the conditions and relative site plans, etc., within a month after the receipt of replies to competitors' question. The block plan showing the site with levels may for the purpose of this competition be taken as correct, and the whole of the buildings must be provided within the area edged pink, and no projections will be permitted beyond the frontage line shown, except a canopy at main entrance to hall, if thought advisable by competitors. The lights of adjoining buildings need not be considered for the purpose of this competition. It may be assumed that access for coals and goods, an emergency exit and drainage by the lane marked on site plan "Access to School" could be acquired if necessary.

(3). RELATION OF BUILDINGS.—The use and administration of the library and the hall will be quite independent of each other, and the buildings in which they are respectively housed need not necessarily be attached. Each will have its own entrances and exits, and the skilful disposition of the two buildings upon the site is one of the problems of the competition. The Corporation reserves the right, if so advised by the assessor, to select the hall from one design and the library from another design and to appoint the author of each architect for that building alone, but every competitor must submit a design for both buildings.

(8). COST.—The Corporation have fixed the expenditure on the whole buildings, including any sculpture or architectural embellishments shown as part thereof, and all internal finishings and details complete, at the sum of £70,000, of which approximately five-eighths would be applicable to the hall and three-eighths to the library; this sum to cover the whole cost, including that of heating, lighting, ventilation, sanitary and fire appliances, hall seating, boundary walls or architectural accessories, but shall not include painting or movable furnishings.

(13). PREMIUMS.—A premium of £400 will be paid to the author of the design placed first by the assessor; one of £300 to the author of that placed second; one of £200 to the author of that placed third; and one of £100 to that placed fourth in order of merit.

(18). QUESTIONS.—Intending competitors may make enquiries (addressed to the Town Clerk) on any points of importance up to February 26 next, and replies to such enquiries will be communicated to each competitor, and must be read as forming part of these conditions. No enquiries received after February 26 will be replied to.

The hall is to be designed to afford all the usual accommodation as set forth in the instructions, but competitors are invited to make every provision that

may suggest itself to them as necessary for such a building. The large hall to seat, exclusive of platform, an audience of 1,500, whereof at least one-third would be in the gallery.

SMALL HALL.—With or without an end gallery to accommodate an audience of 500 on an average basis of 2 feet 3 inches by 19 inches. This to have a small platform, a platform assembly room and two retiring rooms with lavatory accommodation. This hall must have a self-contained heating system.

Lending library, approximately 3,000 super feet; reference library, approximately 1,650 super feet; junior library and reading room, approximately 1,650 super feet; news room, approximately 1,650 super feet; reserve stock room, approximately 350 super feet; file room, approximately 250 super feet; staff room, approximately 200 super feet; staff lavatories for both sexes; vestibule and entrance hall of ample dimension. The whole of the public accommodation *must* be on the ground floor, and should be so planned that the counter of the lending library is the observation centre of the whole. The file room, the staff room and lavatories *may* be on an upper floor.

The local authorities demand distinct requirements for means of access and exits. These are given in a memorandum appended to schedule of conditions, which can be obtained from A. Grierson, Town Clerk, City Chambers, Edinburgh.

New Offices, Trowbridge, Wiltshire

The Wiltshire Working Men's Conservative Benefit Society invite architects to submit designs in competition for new offices at Trowbridge. Assessors: Cyril A. Farey, A.R.I.B.A., and Robert Lowry, F.R.I.B.A. Premiums amounting to £250. Conditions may be obtained by applying to the chief Secretary, Mr. Henry H. Dyer, Stallard Street, Trowbridge, Wilts., and depositing one guinea, which will be returned on receipt of a *bona fide* design or if the conditions are returned two weeks before the closing date of the competition.

Bradford Grammar School

The Bradford Grammar School governors propose to erect new school premises on the Clock House estate at a cost of £150,000. The buildings will be open to public competition. Mr. Arnold Mitchell, of Hammersmith, has been appointed assessor under the building scheme by the President of the Royal Institute of British Architects.

Rathmines Public Baths

The U.D.C. have decided to hold an open architectural competition for the proposed new public baths for Rathmines. A feature of the scheme will be a large swimming pool. It is contemplated spending £40,000 on the baths.

Manchester Building Trades Exhibition

The Directors offer an award of £200 to the architect placed first by the assessors in a competition for designs for new facades on the north, south and west sides of Albert Square, Manchester, and on one side of a new Grand Avenue which it is proposed to lay out on a given axis.

The competition is open to all British subjects, and the Directors have appointed the following architects as assessors: (1) Mr. H. S. Fairhurst, F.R.I.B.A.; (2) Prof. C. H. Reilly, M.A., F.R.I.B.A.; (3) Prof. A. C. Dickie, M.A., F.S.A., A.R.I.B.A.; (4) Mr. Francis Jones, F.R.I.B.A.; and (5) Mr. John Swarbrick, F.R.I.B.A. All designs must be addressed "Architectural Competition," Competition Manager (from whom full particulars, together with plan, can be obtained), City Hall, Deansgate, Manchester, and be delivered not later than 1 p.m. on March 26, 1927.

DESIGN FOR A SCHOOL OF HORTICULTURE.

By E. B. O'ROKKE (A.A. School of Architecture)

An Interesting Design by an A.A. Student

We illustrate this week a scheme prepared in the fourth year course at the Architectural Association School for a "Horticultural College" which the programme suggests might be established in the Inner Circle of Regent's Park.

The proposal is that the present buildings of the Royal Botanical Society would be considered as removed, and a college for theoretical and practical

study of horticulture, with courses and demonstrations open to the public, would be erected on the site. The college would house 100 men and 10 women students.

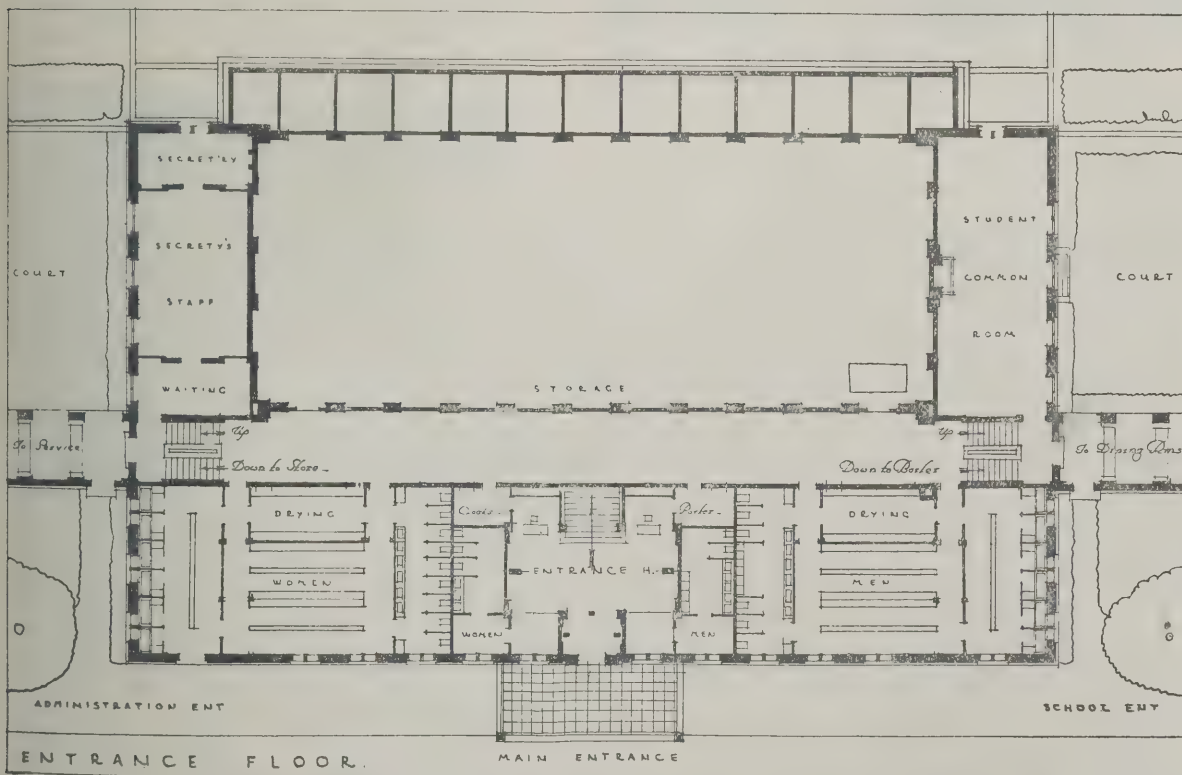

The accommodation calls for school and general offices, two lecture theatres each of 1,200 super feet, two laboratories each of 1,000 super feet, a library 1,200 feet, and two studios of 1,000-1,200 feet each. In addition was a large exhibition hall for plants etc., of about 5,000 super feet.

ELEVATION TO GARDENS.

SECTION.

DESIGN FOR A SCHOOL OF HORTICULTURE.

By E. B. O'RORKE (A.A. School of Architecture).

The drawings by Mr. O'Rorke show a thoughtful plan arrangement, with a good handling of levels by which the lecture rooms are placed over a low ground floor and thus isolated while remaining convenient of access. The laboratories and administration are well grouped in units, and the big hall is excellently arranged for access and effect.

The scheme is interesting in architectural character, modern without being eccentric, and the façade has received just the right note of dignity without over-emphasis of the monumental quality. Mr. O'Rorke was the winner of the R.I.B.A. Bronze Medal for the best intermediate student of the year from any recognised school, and was also awarded one of the R.I.B.A. Archibald Dawney Scholarships.

MODERN DESIGN AS A BUSINESS ASSET

Some Recent Details from Paris

By HOWARD ROBERTSON. Photographs by F. R. YERBURY.

Fig. 1.—"GALERIES DES CHAMPS-ÉLYSÉES," PARIS: THE ENTRANCE ARCHWAY, WITH LAMPS OF LALIQUE GLASS.

A review of the work of last year in London and abroad shows a distinct increase in the number of buildings in which are departures from accepted forms and details. Quite a proportion of these are commercial buildings; indeed, the shop-keeper, the hotel proprietor, the man of business generally, seem to realise that there can be such a thing as novelty in design, and that there are certain movements (they would probably call them fashions) which cannot be altogether ignored by anyone desiring a reputation for being thoroughly up to date.

Strange as it may seem, the commercial man seems to be the real patron of the modern movement; it is he who is giving the architect his chance and allowing him to test out some new theories. He is not yet generally allowing experiments on a large scale, though there are notable exceptions, but he is asking for fresh ideas in decoration and detail. New interiors for the Savoy and the Berkeley Hotels, sections of Austin Reed's in Regent Street, and in Summit House, portions of the new Café Royal, the Paris Trades Shop in Berkeley Street, the interior of Atkinson's in Bond Street, the new Underground Station at Morden, by Adams, Holden & Pearson, provide a few instances of the introduction of the modern note. As a rule, the "high-brow" patron of architecture does not encourage the modern spirit, and is still immersed in period decoration and the accumulation of valuable antiques. It is rather the commercial man who is seeking for something original in design, and is providing the incentive which is making designers and craftsmen study contemporary foreign work and produce something fresh on their own account. Abroad it is always recognised that the English "Arts and Crafts" movement was the starting point for modern design on the Con-

tinental. But we ourselves did not maintain a development from those brilliant beginnings, and are to-day returning the foreigner's compliment by seeking inspiration in countries like Austria, Sweden, France. Some of our latest modern detail in London, in particular, could scarcely have existed but for the Paris Exhibition.

France herself has owed a great deal to Munich and to Austria. French modern work is rapidly acquiring a *cachet* of its own, but the earlier examples of French modernism had many affinities with Central European design. At present, in France and in other countries, including the States, the Oriental is being rediscovered, and Byzantine, Persian, and Chinese detail is liberally drawn upon for inspiration in motives of pattern and relief sculpture. The Paris Exhibition showed a predominance of Oriental influence.

No doubt these waves of enthusiasm for certain types of decoration and ornament are not entirely unconnected with fashions in other important branches of activity, such as, for instance, dress-making. Designers like Paul Poiret have an immense influence on decorative design; it is probably fair to assume that in Paris Poiret's personality reacted on interior decoration, metal work, furnishings generally, and, of course, on colour materials. He is a born decorator; and as design is a matter of very great importance in civilisation (and presumably we are not an exception) a movement as strong as that of the modern d-

Fig. 2.—"GALERIES DES CHAMPS-ÉLYSÉES," PARIS: THE INTERIOR OF THE SHOPPING ARCADE, WITH METAL AND GLASS FOUNTAINS BY RENÉ LALIQUE.

Fig. 3.—LOOKING TOWARDS THE ENTRANCE ON THE CHAMPS-ÉLYSÉES, FLANKED BY CITROËN'S SHOWROOMS.

itions is bound in every epoch to affect architectural design. People create architecture, and not the other way round, and dress is an extraordinarily interesting barometer of the ideals and character of an epoch. A designer like Poiret will probably exert an equally sensitive craftsman such as Edgar

Brandt. It is not too much to suppose that Brandt will not be without effect on René Lalique, and so on. Each designer or group of artists is bound to exert indirect influences on contemporaries, and so the movement grows and develops, particularly if commerce and industry become really interested and

Fig. 4.—A VIEW INTO CITROËN'S SHOWROOMS. NOTE THE LIGHTING FIXTURES ON CEILING AND COLUMNS.

Fig. 5.—THE "PALAIS DE MARBRE" IN THE AVENUE DES CHAMPS-ÉLYSÉES, PARIS:
THE ENTRANCE AND SHOP WINDOWS.

(The frontage is approximately 33 feet, the centre window being about 9 feet wide.)

believe that vitality in design and craftsmanship constitute a genuine aid to success in buying and selling and production.

The importance attached by French commercial firms to procuring the right architectural atmosphere is shown by the care with which some of the latest large shopping centres in Paris have been designed. The Printemps and the new Bon Marché are interesting examples where the architectural character, particularly of the interior, is stressed rather more than is usual in this country; and now there is the new arcade of shops in the Avenue des Champs Élysées, a very well handled development of the usual arcade treatment, not so lofty as the well-known Milanese example, but more spacious than anything we have in London.

The site of this new centre is that formerly occupied by the opulent Dufayel Palace, a building which was somewhat of an object of derision to Parisians on account of its deserted splendour. For Dufayel was reported to have more social ambition than taste, and the pulling down of his hôtel revealed some interiors of rather appalling "lusciousness." Nothing of the Palais Dufayel remains in the new arcade beyond eight marble columns incorporated in the design, and the concierge, an amiable man with a fondness for English cigarettes.

The entrance to the arcade is flanked by two splendid lamps (Fig. 1), in the design of which metalwork is reduced to a minimum. Presumably they are the work of Lalique, who is responsible for the silver and glass fountains (Fig. 2) which are amusingly incorporated in a pavement design which includes flower beds, the contents of which are regularly changed every month, as the flowers would not endure under the conditions in which they are planted.

A very large portion of the arcade is given over to the motor showrooms of Citroën (Figs. 3 and 4), who thus occupies in Paris display space fully as luxurious as that which the London business has taken in Devonshire House. These rooms are admirably treated in character with their purpose, the combination of glass and metalwork harmonising

with the polished chassis and motor bodies, and the detail, reduced to a minimum, is excellent.

The more traditional features of column and entablature which are retained in the architectural treatment of the arcade are scarcely in harmony with the modern treatment of the glass roof and the shop front; but on the whole the effect is good, and the planning gives an impression of spaciousness without monotony.

Across the Champs-Élysées is another new building which every architect visitor will notice, the Palais de Marbre, a building entirely of marble with a mosaic roof, occupied by the furnishing house of Mercier Frères. The shop front (Fig. 5) is particularly good with its pink marble face and black marble surround. The detail is restrained, but by no means dull, as shown by the doorway (Fig. 6), the actual metalwork of which is gilded.

Hotels are naturally as alive as are the shops to the importance of good design, particularly in such features as entrance doorways, which produce on the traveller the first favourable (or unpleasant) impression.

A good number of the newer French hotels are designed throughout in the modern note, but there are many cases where some quite good modern detail has been grafted successfully on an old building. An example of this is the entrance to the Hôtel Edouard VII., in the Avenue de l'Opéra, where a metal and glass scheme (the former painted black relieved with gold) has been extended along the ground floor and entresol, and has added a distinctive note of gaiety which, no doubt, serves as a good advertisement for the hotel (Fig. 7).

There are so many façades in important streets such as the Avenue de l'Opéra, which are designed in a modern key that they no longer excite comment or strike a note of restlessness. Some of the more interesting of these we hope to describe and illustrate in a later issue; but the present photographs show that the ordinary run of commercial architecture seems to acknowledge the practical value of good design and craftsmanship, which develops the use of materials in a modern way.

Fig. 7.—THE ENTRANCE TO THE HOTEL EDOUARD VII, IN THE AVENUE DE L'OPÉRA, WITH METALWORK IN BLACK PICKED OUT IN GOLD.

Notes in Brief

Mr. Edward Warren has disclaimed on his own half and on that of Mr. F. M. Elgood and Mr. H. Rogers, any responsibility for recent town-planning proposals at Oxford. These three architects were appointed in November, 1925, as an Advisory Committee by the then Mayor of Oxford, the Rev. J. Carter, but since his termination of office in November last, they have had no official connection with the city.

Cracks have appeared in the walls of the Savoy Chapel, London, and the building has, for some time, been under observation by technical officers of the Duchy of Lancashire. The original Chapel, built by Henry VII, was destroyed by fire in 1864, and the present structure is a restoration carried out by Queen Victoria.

The London County Council has a collection of prints and water-colours of London, now numbering some 6,600 items, and these are exhibited, a series at a time, and can be seen by the public, who are admitted to the County Hall from 10.30 a.m. to 12 noon on Saturdays, and on Bank Holidays in the mornings and afternoons. Application for parties to see the drawings must be by letter; but persons specially interested can generally view the exhibition by special arrangement during office hours. The series at present on exhibition relates to St. Pancras Borough.

The Wesleyan Methodist Chapel in Grosvenor Street, Manchester, which was built in 1820, and has a historic connection in that particular religious community, is to be pulled down. This decision is due to the entire change in the character of the neighbourhood, which has now become a commercial centre.

The Bill to obtain powers to move Covent Garden Market to Bloomsbury is strongly opposed. The London County Council, the City Corporation, the City Councils of Westminster, and the Borough Councils of Holborn and St. Pancras have passed resolutions to oppose the Bill; while the Foundling Estate Protection Association, the London Society and other bodies allied with it, and the present Market tenants are also against it.

The Manchester Corporation has commenced the gradual widening of Brook Street, between Princess Street and Upper Brook Street. The work is to be continued as the "material alteration" of existing premises affords an opportunity of setting back the frontage line.

In a circular issued by the Ministry of Health to F.R.I.B.A., suggests that had coloured buildings, upon which that paper has published some correspondence, might be prevented if architects refused "to specify the goods of any firms who make bricks and tiles of a colour and texture that literally scream." The course suggested need inflict no injury on manufacturers seeing that almost any colour can be reproduced irrespective of the clay used.

The remains of a pre-Roman hut, apparently of the wattle and daub type, has been discovered during excavations in a field on Headford Hill, near Yeovil. The stones of the ancient hearth were found in position. Worked flints, shards of Samian ware and a few Roman nails were other relics disclosed. A short distance away, during some road widening operations, a cinerary urn, made of coarse clay and sand of the late Bronze Age or Early Iron Age, was turned up, also bits of charred wood and bones.

Fig. 16.

THE TWENTIETH CENTURY HOUSE

V.—The Æsthetics of Hygiene

By A. TRYSTAN EDWARDS.

The Recess has been presented not only as the means of disguising certain features of building which are apt to be ugly unless disguised, but also as a definite element of architecture capable of making an important contribution to the interest and dignity of great formal schemes of building. The recess, however, can also be usefully adapted in streets of dwellings of "informal" composition. Fig. 16 shows half a dozen houses comprising a continuous terrace, where nevertheless a considerable variety has been achieved in the design of the several façades. Three different types of recess are shown. On the left we see a broad "open" recess framed in a single flat arch surmounting a pair of pilasters. As this recess (No. 1) is shallow it may be assumed that the fenestration within it can be seen from most points of view, and as this fenestration is in scale with the windows on either side of the recess, the latter has been brought into æsthetic relationship with the neighbouring façades. On plan this first house seems capable of a convenient arrangement, for, if necessary, a hall could be provided with a window near the door and giving access to a cloak-room and lavatory lit at the side of the recess; or else the staircase hall could have a window on the left of the front door, while the window the other side could be allocated to the cloak-room and lavatory. It is also possible to imagine that the recess as a screen for sanitary pipes and closet windows is only operative on the first floor, and that the ground-floor windows belong to living-rooms only. House No. 2, considerably larger than the first, has at the right of the entrance doorway a bay window extending to two floors. One may assume that this house may share the large recess on the left, for there is nothing to prevent the end window adjacent to it from being allocated to cloak-room and lavatory. Here again the house, as judged by the elevation, suggests the possibility of convenient planning, for one can conceive of the entrance hall having on its right a sitting-room with bay window, and on the other side communicating directly with a cloak-room. Or else, if the house happens to face north, the dining-room could be on the right of the entrance door and on its left a kitchen with scullery and sink having access to the large open recess of the next house. To the right of the bay is another recess, this time "bridged," which also could, if necessary, serve the houses on either side of it. For instance, the bedrooms of house No. 2 could be adjacent to bathrooms served by either the first recess or by the second. House No. 3 with the first of the round-headed doorways is served by recess No. 2, while house No. 4 is served by recess No. 3, as is also

house No. 5. It is noteworthy that while recess No. 1 is of a normal type—a projecting "bridged" recess—the example No. 2 has its front flush with the main façade, while its back wall is articulated by being raised in the form of an attic which is framed between two ramps.

The modernity of this terrace consists not in detail, which may be quite conventional, but in obvious flexibility of composition which characterises each individual member of the group. For here a continuous row of dwellings all showing a distinct departure from the old-fashioned narrow-fronted house with a narrow passage and a room on one side, on either side of it; there is space for well-lit halls, and, moreover, these halls can readily give access to cloak-rooms and lavatories, which, however, are arranged that they do not spoil the façade abutting on the street. On the floors above also it is not impossible for bathrooms and closets to look out upon the public thoroughfare without their presence giving offence.

Fig. 16 is but one example out of innumerable others which could be designed to illustrate how the recess can be employed as an aid not only to domestic planning, but to the composition of street façades. It is perhaps worth observing that while various types of recesses may legitimately be displayed in the pattern of a terrace, these latter will not harmonise either with each other or with the fenestration on either side of them unless the scale of the windows belonging to the recesses is kept fairly uniform. In Fig. 16 this condition appears to be satisfied, and I have not reached a point of allowing the repetitive element in the fenestration to exercise, as it were "a majority rule" over the composition, so that the terrace has sufficient rhythm and regularity to save it from appearing as a mere miscellany of conflicting and anarchical features. As it is here shown, the façade in Fig. 16 belongs to the front of the building, but there is no reason why a similar combination of recesses and ordinary windows should not characterise the back of a row of houses, especially where these abut upon a common garden or are much exposed to public view. If the design of some of the entrances were altered, so as to have the status of back doors, this design might well suffice as a suggestion for the rear elevation of a terrace. Another possibility, which I shall have occasion to illustrate in detail later, is that both front and back doors should alike face the street, and with such an arrangement the recess would be the only means of making the façade both pleasing and decorous.

Fig. 17 is perhaps of interest in that it represents

compromise between the "open" and "bridged" type of recess. Here it was considered that if the cavity had been "open" to the height of four storeys it would have appeared too lanky to be graceful, so a bridge has been introduced, which has the additional advantage that it enables the recess to take cognisance of the vertical dimension of the attic storey. In this instance the roof-line of the building is inflected to take account of the recess by being raised in the form of a pediment. Fig. 18 illustrates yet another variation, for here the arch of the recess is lower than the top of the building; and, further, this recess differs from the others hitherto shown in that even its inside wall is set back a little behind the main façade. Above the level of the arch the profile of the attic storey is bent away from the opening in the form of decorative curves, which are designed to emphasise the position of the recess, and to enable the main façade to take obvious notice of it. This treatment shows a departure from the normal type of recess, and it is open to the objection that, for the sake of formal effect, the advantage of the recess has been partly sacrificed in the attic, and while waste-pipes emanating from this level might be effectively concealed, a ventilating pipe would yet have to rear its head above the cornice, and would necessarily show itself near the row of three windows in that part of the attic which lies at the back of the recess. It might be contended, however, that for the sake of the variation in the form of the recess a single ventilating pipe would, once in a way, be tolerated even on the façade facing the street.

I have already suggested that an "open" recess cannot with propriety be very narrow, and in such an event it has the appearance of a vertical slit in the wall, which defies the scale of the fenestration. On the other hand, it is true to say that the "bridged" recess, if its width exceeds a certain dimension, must have the "bridges" (that is to say, the horizontal bands of wallage stretching across it), supported either by columns or mullions as in Fig. 16, illustrated in the last article, or by brackets. This example may be described as "a bridged and bracketed recess." Its front wall is flush with the main façade, while its back wall is recessed and crowned with a cornice.

This preliminary investigation into the character and possibilities of the recess may now be followed by a more detailed application of this feature.

Fig. 18.

Coming Events

Birmingham Architectural Association.—Friday, February 4.—Students' Evening and Exhibition.

The Bristol Society of Architects.—Friday, February 4.—Annual General Meeting.

The Surveyors' Institution.—Monday, February 7.—Mr. Frank Hunt, C.V.O., on "The Future of London Squares." 12 Great George Street, S.W. 8 p.m.

Town Planning Institute.—Friday, February 11.—Major Harry Barnes, F.R.I.B.A., on "The Slum Problem." Caxton Hall, Westminster, S.W.1. 6 p.m.

Edinburgh Architectural Association.—Wednesday, February 9.—Mr. Howard Robertson, F.R.I.B.A., on "Some Aspects of Modern Work."

Hampshire Architectural Association.—Friday, February 11.—General Meeting and Lecture at Portsmouth.

Liverpool Architectural Society (Inc.).—Wednesday, February 9.—Honan Night. Mr. Harold Bramhill on "A Tour in Tuscany." (Winner of the Scholarship for 1927 will be announced.)

Manchester Society of Architects.—Wednesday, February 9.—Mr. G. A. Sutherland, M.A., on "Auditorium Acoustics."

Royal Institute of British Architects.—Monday, February 14.—Business Meeting. Election of Members. 9 Conduit Street, W.

Sheffield Society of Architects and Surveyors.—Thursday, February 10.—Mr. Edward M. Holmes on "The New Rating and Valuation Bill, 1925."

Institution of Heating and Ventilating Engineers.—Wednesday, February 9.—Dr. Margaret Fishenden on "The Effect of Weather Conditions upon the Heat Requirements of a House." Holborn Restaurant, W.C.2. 2.30 and 7 p.m.

Edinburgh Architectural Society.—Monday, February 7.—Mr. J. J. McArthur on "Modern Decoration."

The Royal Institution.—Friday, February 11.—Mr. Ernest Law, C.B., on "Old Hampton Court Palace Revealed." 21 Albemarle Street, W.1. 9 p.m.

The College of Estate Management.—Monday, February 7.—Mr. Sydney A. Smith on "Valuation of Shops, Factories and Flats." 35 Lincoln's Inn Fields, W.C.2. 5.30 p.m.

Design and Industries Association.—Tuesday, February 8.—Messrs. Stanley Hamp, F.R.I.B.A., and A. B. Reed, A.R.I.B.A., on "French Iron Work." 6 Queen Square, W.C.1. 8 p.m.

Fig. 17.

BUILDING CRAFTSMANSHIP—OLD AND NEW—V

By Nathaniel Lloyd, F.S.A.

Weatherboarding, on studding, dates, at least, from the early part of the 18th century. In America it is called clapboard, pronounced clabboard. It probably originated in need for protection from weather of leaky old timber and plaster houses. With a good plain-tile roof, weatherboarded and painted buildings look well.

A development of weatherboarding is boarding walls with wrot boards, chamfered to simulate stone blocks and then painted.

THE CRAFT OF THE CARPENTER

By Nathaniel Lloyd, F.S.A.

Another wall covering is with plain tiles nailed to battens or brickwork and, less frequently, to rough boarding. In cottage work the angle is often stopped by a fillet, as seen in the weatherboarded cottages on the preceding page. In others chamfered pieces of board are fixed to represent stone quoins.

A form of weathertiling found in the S.E. counties, and known as brick-tiling or mathematical tiling, is difficult to distinguish from brickwork when bedded in mortar so that joints show. The left-hand illustration is built in this way. These tiles are made in headers and stretchers. (*See detail.*)

Professional Societies

The Royal Institute of British Architects

We take the following notes from the minutes of the Council, held on January 17, 1927:

Rheumatic Heart Disease in Children.—The Council passed the following resolution and ordered it to be forwarded to the British Medical Association: "The Council of the Royal Institute of British Architects have had their attention called to the Report on Rheumatic Heart Disease in Children by the British Medical Association, and, having regard to the fact that it is in the public interest to eliminate dampness in all dwellings, they note with approval that the Science Committee have appointed a sub-committee to investigate and report on this subject."

Exhibitions of Modern Architecture.—On the recommendation of the Exhibition Joint Committee, the Council have approved the arrangements for the first of the annual exhibitions of modern architecture, to be held in the R.I.B.A. Galleries from April 27 to June 3. Full particulars will be published at an early date.

British Architects' Conference, 1927.—A Committee was appointed for the purpose of making and carrying out the arrangements for the Conference of 1927.

The Preservation of Old Bridges.—On the recommendation of the Art Standing Committee, it was decided to support the campaign of the Society for the Protection of Ancient Buildings for the preservation of old bridges by giving publicity in the R.I.B.A. journal to the work which is being carried out by the S.P.A.B. in connection with old bridges by inviting members to supply information regarding such bridges in their locality, and by inviting all recognised schools to encourage their students to measure bridges of architectural or archaeological interest.

The Preservation of Cottage Architecture.—Mr. E. Stanley Hall, hon. secretary, R.I.B.A., was appointed to represent the R.I.B.A. at a conference which will be held at the Royal Society of Arts on January 26, to consider the best means of preserving the cottage architecture of this country.

The Yorkshire Architectural Society

The annual dinner of the York and East Yorkshire Architectural Society, which is allied with the Royal Institute, took place recently at the Guildhall, Hull.

Major W. S. Walker, of Hull, proposing the toast of "The Royal Institute of British Architects," said it was founded in 1837 and was at present engaged in promoting an Architects' Registration Bill, which, while conferring benefits and privileges upon the profession, would protect the public from incompetents and ensure that none but efficient persons would be engaged as architects.

Mr. Guy Dawber, in reply, said the ties which bound the allied societies to the parent body, the Institute, were never stronger than they are to-day. Quite recently they had been able to give representation upon the Council to all provincial societies, and it made them one great organisation. Architecture fulfilled a human need, and there was a feeling throughout the country that if they were to get the best out of life they must have the best architecture. The country was rousing itself to the necessity of placing some control upon indiscriminate, thoughtless and ugly buildings, such as had disgraced this country for a generation, both in town and country. Municipalities had awakened to the fact that it was time to take in hand schemes of town planning, the clearing out of slums, and Hull was in the vanguard of that splendid movement. There was also a keen interest taken in architecture by the Press, and it showed an enlightened feeling on the part of the public. As

instances of this he spoke of the agitation for the safety of St. Paul's, the bridges over the Thames, the saving of the City churches of London, and the fight for the Foundling Hospital site and the appropriation of the squares of London by commercial syndicates, a thing which ought never to be allowed. For years past architecture had been treated as the Cinderella of the Arts. It was gratifying to find the Press beginning to realise what an invaluable asset architecture was to the people of this country. Referring to the success of two Hull students, he said he hoped that in the new University College for Hull the authorities would see their way to embody a school of architecture. A great city like Hull should give every possible advantage to students who wanted to study architecture.

The toast of "The York and East Yorkshire Society" was proposed by the secretary of the Institute, Mr. Ian MacAlister, and responded to by Major Dossor.

Norfolk Association of Architects

The annual meeting of the Norfolk and Norwich Association of Architects was held recently at Suckling House, Norwich. The report of the Council for the year 1926 stated that the membership on December 31 was: Full members 42, associate members 29, honorary members 7, making a total of 78, as against 79 last year. Only four ordinary general meetings were held, papers being read as follows:—Mr. C. B. Dann, "Norman Architecture in Norfolk Parish Churches"; Mr. R. B. Walker, "Town Planning, with Special Reference to Norwich"; Mr. S. J. Wearing, "Building Problems Old and New"; Mr. P. S. Crotch, "Plastering." Two public lantern lectures were held, as follows:—Mr. F. R. Yerbury, "Some Modern Buildings in Europe"; Mr. E. Guy Dawber, "The Preservation of Rural England." The officers and Council were re-elected as last year. Mr. Ian MacAlister, secretary of the Royal Institute of British Architects, who was present, recalled the meeting five years ago when the association was formed, and congratulated it on its present vitality and the value of its work. He referred to the remarkable growth in the importance of architecture and the profession during the last ten years, and discussed the Bill for the registration of architects, showing its value in safeguarding the public.

Incorporation of Architects in Scotland

The monthly meeting of Council was held recently at 15 Rutland Square, Edinburgh, Mr. G. P. I. Young, F.R.I.B.A., president, in the chair. A presentation was made on behalf of Miss MacGibbon of architectural books and drawings which belonged to the late Dr. David MacGibbon, architect, Edinburgh. A report was submitted as to 'approaching various public bodies on the subject of the preservation of rural Scotland, preparatory to the formation of a Scottish Council for this purpose. Elections were made of one Fellow, four Associates, and twelve Students.

A New Carillon

The American Society in London recently visited Messrs. Gillett & Johnston's bell foundry at Croydon and inspected a carillon of 43 bells which is to be installed at St. Chrysostom's Church, Chicago. An inspection was also made of the casting of one of the bells of a carillon ordered for Princeton University. A carillon recital was given, of which, it was stated, gramophone records had recently been made. Among other work, Messrs. Gillett & Johnston are making a large carillon and clock for Toronto University, and a clock for the memorial tower of the Canadian Houses of Parliament at Ottawa is shortly to be dispatched.

The above illustration is from a photograph taken in one of a series of old brick vaults under the pavement in front of the Royal Society of Medicine Building at 1, Wimpole Street, W.1. J. J. Joass, F.R.I.B.A., the architect of the building, was asked to advise how the ancient coal-vaults, the walls of which leaked abominably, could be made dependably waterproof. Many methods and materials had been applied in vain. The work presented real problems. It was efficiently executed under Mr. Joass's instructions by Plastering Limited of Brixton. A sand-cement rendering, gauged with water to which "Colemanoid" had been added, insured an absolutely impervious wall. The result is an object-lesson in superfine waterproofing. Write to me for "Colemanoid" specifications.

Regent House,
Regent Street,
London, W. 1.

Frederic Coleman

London Building Notes

ALDWYCH.—The London Theatres of Variety, Ltd., propose to acquire the remaining undeveloped portions of the Aldwych sites from the L.C.C., and to build two large blocks of premises, to comprise four theatres, a bank or insurance offices, restaurant, dance hall, and offices. The plans are to be forwarded to the L.C.C. shortly, the architects being Messrs. William & T. R. Milburn, F.F.R.I.B.A., Fawcett Street, Sunderland and Cranbourne Mansions, Leicester Square, W.C.

BECONTREE.—An extensive area of land at the apex of Becontree Avenue and Vallance Avenue, containing about 92,000 square yards, is to be developed by the erection of two rows of shops, with flats in the upper floors. Plans have been prepared for 32 shops, the architect being Mr. Edward Meredith, A.R.I.B.A., Goodmayes, Essex.

BEDFORD SQUARE.—Plans have been approved for the erection of a block of office premises, consisting of five floors, on a site in Caroline Street, Bedford Square, W.C. The architects are Messrs. Hendry & Schooling, A.A.R.I.B.A., 53, Doughty Street, W.C.1.

BRIXTON ROAD.—At the statutory meeting of Selfridge's Provincial Stores, Ltd., 100 Oxford Street, W.1, it was stated that work had just started in the rebuilding of about 7,000 square feet of ground space at the premises of Messrs. Quinn & Axtons, which would give about 20,000 square feet when completed. The operations are under the direction of Mr. H. Payne Wyatt, 465 Brixton Road, S.W.9.

CRICKLEWOOD.—A contract has just been placed for the building of the proposed new Cricklewood Telephone Exchange, the successful contractors being Messrs. Harry Neal, Ltd., Hendon Central "Tube" Station, N.W.4. Plans have been prepared by H.M. Office of Works, Storey's Gate, S.W.1, on behalf of the London Telephone Service.

DRURY LANE.—The Fortune Theatre in Drury Lane, W.C., has been purchased for £90,000 by Messrs. Walls & Henson, Ltd., who before re-opening it in September intend to use the interval for carrying out an extensive scheme of redecoration.

ENFIELD.—New branch departmental stores are to be erected in Gordon Hill, Enfield, where the Co-operative Society have recently concluded negotiations for a site. The architect to the Co-operative Wholesale Society, Ltd., Leman Street, E.1, is Mr. L. G. Ekins, F.R.I.B.A.

FINSBURY.—The War Office last week signified to the City of London Territorial Force Association its approval of plans for the building of a lecture room and gun park at the Depot at Bunhill Row, E.C., in connection with the scheme of extensions there. The work will be carried out under the direction of the Association's Surveyors, Messrs. Mark W. King & Sons, 6 Holborn Viaduct, E.C.1.

FULHAM.—The Fulham Conservative Club are to erect new premises, consisting of club and committee rooms, billiards hall, etc., at the junction of Fulham Palace Road and Silvertown Street, W. The building is being erected by Messrs. Geo. Newton & Hill, 93 Southwark Bridge Road, S.E.1, to the designs of Messrs. Wallis Gilbert & Partners, Architects, Roland Gardens, South Kensington, S.W.

GOLDERS GREEN ROAD.—A site in Golders Green Road, N.W., has been purchased by the Suburban Super Cinemas, Ltd., 191 Wardour Street, W.1, where they propose to build a picture theatre, accommodating from 1,500 to 2,000 persons, with crush hall, café, etc. Plans have been prepared by Mr. Clifford Aish, Architect and Surveyor, 22 Bedford Street, W.C.2.

GREAT PORTLAND STREET.—A corner site in Great Portland Street and Langham Street, W.1, is to be developed by the clients of Messrs. Gordon Thomas & Co., 23 Margaret Street, W.1, by the building of a block of shops and offices. The proposed building, of seven storeys, has been designed by Mr. William Arthur Lewis, A.R.I.B.A., 11-12, Finsbury Square, E.C.2.

HAMMERSMITH.—A block of self-contained flats is being erected upon a site at the corner of Warwick Avenue and Hammersmith Road, W., on land owned by the Prudential Assurance Co., Ltd. The builders are Messrs. W. H. Gaze & Co., Ltd., High Street, Kingston-on-Thames. The plans are the work of associated architects: Mr. C. H. Roberts, A.R.I.B.A., 58 Frith Street, W.1, and Messrs. Josephs, 2 Paul's Bakehouse Court, Godliman Street, E.C.4.

HAYES.—The Great Western Garden Village Society have decided to build a further batch of 50 houses on their Hayes housing estate, which will make the layout practically complete. The architect is Mr. T. Alwyn Lloyd, F.R.I.B.A., M.T.P.I., 6 Cathedral Road, Cardiff.

HENDON.—A large site in the Circus has been secured by local interests for the erection of an important property, comprising a cinema, dance hall, and shops. Plans for the new buildings are now under discussion, the architect being Mr. G. O. Scorer, F.R.I.B.A., 21 Warwick Gardens, Kensington, W.

ILFORD.—It is proposed to completely reconstruct the old "Horns Tavern" in Horns Road, Ilford, which is owned by the London & Burton Breweries, Ltd. Plans have been approved by the local authorities, the architect being Mr. William Stewart, F.R.I.B.A., Newlyn House, Aldgate, E.C.

ILFORD.—The Ilford Emergency Hospital Committee have decided to erect new buildings, the designs of Messrs. Dawson, Son & Allardvee, Clock House Chambers, Barking. The proposal comprises the building of a

men's block, at £4,067; a women's block, at £4,067; operating block, £1,220; kitchen and nurses' block, £11,857; casualty and receiving department, £1,000; out-patients' department, £200; the equipment for the wards costing £1,450, and for the offices £1,832.

ISLINGTON.—Quantities are now in course of preparation, by Mr. F. W. Falkner, 11 Princes Street, W.1, in connection with the proposal of the Islington Borough Council to build an addition to their Municipal Buildings in Tyndale Place, N.1. As referred to in *THE ARCHITECT AND BUILDING NEWS* on December 31 last, the plans which include as their principal feature a large public hall, have been prepared by Mr. E. C. P. Monson, F.R.I.B.A., Finsbury Pavement House Moorgate, E.C.2.

KENNINGTON.—The London County Council have considered the plans prepared by Mr. Arthur H. Ryan Tenison, F.R.I.B.A., 21 Great Peter Street, S.W.1, for the removal of the Archbishop Tenison's Grammar School from its present site in Leicester Square, W.1, to Kennington, S.E., on a location near the Oval. The scheme involves the erection of a completely equipped school, the cost of which is estimated at about £54,000.

LAMBETH.—A new boys' club is to be erected in the parish of Lambeth on a site approved by the Bishop, at a cost of about £10,000. Plans for the new buildings have been prepared by Mr. H. M. Fletcher, F.R.I.B.A., Gray's Inn Square, W.C.

LAMBETH.—Work is about to commence on the site in Cornwall Road S.E., of the new police married quarters, a contract having now been signed by Messrs. F. and H. F. Higgs Ltd., Station Works, Hinton Road Herne Hill, S.E.24, at £99,510. The building will be 5 storeys high, of brick with stone dressings, and has been designed by Mr. G. MacKenzie Trench, F.R.I.B.A., F.S.I., the police architect and surveyor. The quantity surveyors are Messrs. Thurgood, Son & Chidgey, 18 Adam Street, W.C.

LEADENHALL STREET.—The London County Council last week agreed to the erection of an office building at Nos. 7-10 Leadenhall Street, E.C.3, which will be of a greater height than that prescribed by the London Building Act, 1894. The architects are Messrs. Josephs, 2 Paul's Bakehouse Court, Godliman Street, E.C.4.

NEWGATE STREET.—A block of business premises is to be erected on the site of Nos. 31 and 32 Newgate Street E.C.1, the existing old buildings now being in course of demolition. The new buildings, of 6 storeys, will be erected by Messrs. Griggs & Son, 100 Victoria Street, Westminster, S.W.1.

POULTRY.—Nos. 39-41 Poultry E.C.2, have been acquired by Messrs. Joseph Lyons & Co., Ltd., Cadbury Hall, Kensington, W., with a view to their reconstruction and eventual re-opening as a branch restaurant and depot. The necessary building and equipping work will be executed by the company's building department.

No. 8

THE last, and by no means, least important attribute of a dependable service is quick delivery.

All orders, whether large or small, receive the same attention from our organisation; no discrimination is made between them; they are both despatched just as quickly and carefully. Your client's job, therefore, will not be delayed.

We can give you delivery to-morrow morning of any quantity of Courtrai-du Nord Roofing Tiles.

**THE COURTRAI-DU
NORD TILE CO., LTD.**

LONDON, S.E.1

Courtrai-Du Nord
ROOFING TILES

The Week's Building News

The following abbreviations are used: U.D.C. for Urban District Council; T.C. for Town Council; R.D.C. for Rural District Council; E.C. for Education Committee; B.G. for Board of Guardians; P.C. for Parish Council; B.C. for Borough Council; M.H. for Ministry of Health; M.T. for Ministry of Transport; C.B. for County Borough; B.E. for Board of Education. Direct confirmation should be obtained before commitments, for which we cannot be responsible, are made.

ABERYSTWYTH.—Plans have been prepared for the erection of a new hotel with 90 bedrooms. The scheme is being promoted by a local syndicate, and the architect is Mr. P. Hunty, of Birmingham.

BANGOR.—Considerable extensions are to be carried out to the Bangor Gas Works, which are estimated to cost £19,000.

BETHESDA.—Mr. F. J. Rees, surveyor to the Bethesda Council, has prepared a building scheme by which six-roomed parlour type houses, containing all modern conveniences, can be built for the modest figure of £370 for single houses, £360 each for blocks of six, and less for terraces of a dozen or more.

BIGGLESWADE.—The U.D.C. passed plans for a new wireless factory for "Star Wireless Supplies" in Potton Road.

BIRKENHEAD.—The Estates and Development Committee propose an outlay of £293,098 in erecting 553 parlour and non-parlour houses. Application is also to be made for powers to borrow £17,090 for 30 three-storey flats on Corporation land on the west side of Railway Road. The 553 Hoylake Road houses will comprise 78 parlour and 475 non-parlour. The contract work has been divided into three portions, and tenders accepted as under: Section 1—17 non-parlour and 20 parlour, The Hamilton Estates, Ltd., Birkenhead, £19,095; Section 2—262 non-parlour and 32 parlour, Messrs. Selwood, Lloyd & Co., Birkenhead, £133,692; Section 3—196 non-parlour and 26 parlour, Messrs. Selwood, Lloyd & Co., £101,288. Messrs. Selwood, Lloyd & Co.'s tender, £20,900, for the 38 Hurrell Road houses had also been accepted by the Committee; also for the 30 Railway Road flats, at £16,500.

BIRMINGHAM.—The Corporation recently approved of a scheme for the erection of the following conveniences:—Corporation Street and Lancaster Street, £1,500; Garrison Lane, corner of Camp Street, £950; Rubery Tram Terminus, £900; Rednal Tram Terminus, £2,000; High Street, King's Heath, £1,000; Washwood Heath Road, Ward End Park, £700; Salford Bridge, £1,000; Wood End Lane, £900; Stratford Road (Mermaid Hotel), £1,500; Stratford Road (near new tram terminus), £950; Bedford Road, Railway Arches, £673; Lightwoods Park, Hagley Road, £1,100; St. Paul's Churchyard, Brook Street, £700; Witton Lane (Aston Hotel), £800; Dudley Road and Aberdeen Street, £900; Harborne, £1,000; Pye Hayes, £900; Oak Tree Lane and Bristol Road Junction, £2,500; Acock's Green, £1,000; Stechford, at new tram terminus, £1,200; Vaughton Street for Gooch Street, £1,500.

BOLTON.—The Bolton Corporation Housing Committee have decided to invite tenders for the erection of 118

houses at Higher Swan Lane and 312 houses on the Moorfield Estate.

BOROUGH ROAD.—The Polytechnic is to be rebuilt at a cost of £80,000.

BRANSTONE.—It is stated that in view of the artificial silk making which is to be started in the town, the Burton-on-Trent Corporation propose to build 350 houses for the workers. A site has been viewed, and the cost is stated to be £180,000.

BROWNHILLS.—The M.H. have given sanction to the U.D.C.'s proposals to erect 54 houses at Norton, and Mr. F. S. Harrison has been appointed architect to the scheme. The Clerk has been instructed to take the necessary steps to acquire land at Walsall Wood, on which the Council propose to erect 46 houses. Plans for a new picture house, to be erected in High Street for Mr. E. Jervis, were approved.

BURSLEM.—Stoke Corporation have acquired a site at Sneyd Hill, Burslem, for the erection of 18 houses, and obtained sanction for the erection of 48 on the Acres Wood Estate.

BURTON.—In the course of a municipal bye-election meeting at Burton it was revealed recently that the Corporation proposed to build 350 houses for the workers expected to come to the town when artificial silk making is started at Branstone factory. The Chairman of the Housing Committee, in an interview, said a site had been viewed, and the scheme would cost £180,000.

CAERPHILLY.—A new church hall is to be erected, at a cost of £25,000. Plans are being prepared by Messrs. Phillips & Wride, 7 Pembroke Terrace, Cardiff.

CARLOW.—The U.D.C. have decided upon the erection of another 50 houses.

CATFORD.—Fifty-three houses are to be erected in Exbury Road and River View Park, Catford, by Mr. A. Kirkman. Mr. P. H. Higgins is to build 20 houses in River View Park.

CHERTSEY.—The U.D.C. are to seek sanction from the M.H. to the erection of 200 more houses.

CLARE.—The R.D.C. have decided to erect 34 houses in parishes as follows: Clare, 8; Wickhambrook, 6; Great Bradley, 4; Stansfield, 2; Denston, 2; Little Bradley, 2; Little Thurlow, 2; Wixoe, 2 (all of the non-parlour type); and Little Wratting, 6 (of the parlour type).

COULSDON.—The U.D.C. have asked the surveyor to report as to the erection of another 50 houses on a new site at Coulsdon.

COVENTRY.—The City Council, at a cost of about £700,000, is establishing a new electricity station at Foleshill. The site covers 53 acres, and is adjacent to the old Victoria Colliery.

CWMAMMAN.—The Cwmamman U.C. has received sanction for the erection of 20 houses under the provisions of the Housing Act, 1923-24. Financial assistance was also promised towards the erection of 50 houses by builders,

provided the work was commenced within March 31 next and completed by September 30.

DERBY.—The committee decided to ask the T.C. to apply for a loan of £35,595 to cover the cost of building the Nightingale Road Senior School.

DUNDEE.—The Dundee Housing Committee has decided to purchase ground at Arklay Street and Sandeman Street for the erection of houses. The proposal is to build twelve blocks of three-storied tenements, 144 houses; six blocks of flatted dwellings, 24 houses; five blocks of 60 houses; an extension of the Byron Street tenements; and 29 blocks of brick flatted dwellings, 116 houses.

DUNFERMLINE.—The managers of Dunfermline and West Fife Hospital have decided to proceed with an extensive scheme of extensions, at an estimated cost of £46,000.

EDINBURGH.—The following warrants were recently granted: John Kettle—8 lock-up garages at 3 Murieston Lane; Thomas McCrae—sub-division of 23 Learmonth Terrace into 3 houses; William Philp—two bungalows and two garages at Queensferry Road, Blackhall; Miss Hilda E. Rea—bungalow at Comiston Road; Buckstane; John Wilson—2 villas at Niddrie Road; W. K. Duncan—bungalows at 10 and 12 Bryce Avenue; John McCormack—2 bungalows at 7 and 9 Goff Avenue; Pillans & Robertson—house at Hillview Terrace, Corstonphine; D. C. White—sub-division of 9 Eglinton Crescent into 3 houses.

EDMONTON.—The U.D.C. have received sanction from the M.H. to the borrowing of £57,300 for the erection of 100 houses by direct labour on the No. 4 Housing Scheme.

FALKIRK.—The Dean of Guild Court recently granted warrants to Falkirk T.C. in respect of three fresh schemes for the building of 238 dwelling houses, at an estimated expenditure of £101,000. The three new schemes are to be at Gairdoch, Millflats, and Burnhead Lane, and will respectively cost £45,000, £43,000, and £13,000. The Gairdoch 122 houses are to be erected. The Millflats scheme comprises 113 houses of the Dugdale-Dennis steel frame type. At Burnhead Lane 2 houses are to be built for tenants who will be dispossessed by the Council slum clearance scheme.

FINSBURY.—The L.C.C. has sanctioned a loan of £54,946 to the Finsbury Council, for the erection of flats in Mantell Street, N.

GLASGOW.—The Housing Committee of Glasgow Corporation are to be advised by their sub-committee of Sites and Buildings to undertake a scheme of erecting between 500 and 600 houses on the system of concrete construction in which Messrs. Boot (Ltd.) specialise. The Glasgow sub-committee recommend that a contract be arranged with Messrs. Boot, if satisfactory conditions can be made, for

The Hall Mark of Your Craftsmanship

A NY Product that has—by its sheer merit—attained prominent distinction in the industries of to-day reflects the sincere craftsmanship of its makers in all things. Henceforth all further products of theirs are established upon the confidence that the first has won.

The position that the "Crabtree" Switch occupies to-day needs little comment. That the same lofty standards of sincere Craftsmanship are embodied in every "Crabtree" Accessory are only too apparent to all who have handled them.

Such Quality in detail is to be found in even the smallest Crabtree Accessory. Such care in detail that proves forethought in design and scrupulous accuracy of workmanship throughout.

"Craftsmen in Electrical Switches."

the erection of the houses on a site north of Hawthorn Street, Possilpark. The houses are to be of three apartments, with 4 houses in each two-storey block.

GRANGE-OVER-SANDS.—Lancashire Standing Joint Committee are to erect police buildings at Grange-over-Sands, at an estimated cost of £5,000.

GRAVESEND.—Mr. John G. Bennett, the borough architect for Gravesend, has prepared a scheme for the erection of 192 houses to complete the King's Farm Housing Estate, the cost being estimated at £100,000.

GUISELEY.—The M.H. have approved the decision of the Guiseley U.C. to acquire the Hawkhill Estate, at a cost of £3,000, as a new building estate.

HADDINGTON.—The Western District Committee of Haddington has decided to erect 200 three-apartment houses, at a cost of £390 each. Forty of the houses are to be gone on with at once—12 at Aberlady, 12 at Gullane, 8 at Longniddry, 4 at Dirleton, and 4 at Macmerrie.

HEMSWORTH.—Hemsworth R.C., at the request of the M.H., will reconsider after March 31 a plan to erect a further 500 houses.

HEREFORD.—The Hereford City Council of Christian Congregations for Social Service have under consideration a scheme for providing new houses for the working classes so as to abolish slum property. At a meeting during the week-end the secretary (Dr. Vincent Shaw) explained that the scheme was to build 40 houses, 12 houses to the acre, and each house to consist of three bedrooms, living-room, scullery, pantry, bathroom and lavatory.

HITCHIN.—The U.D.C. passed plans for 12 houses and alterations to shops of the Old Vicarage, and Chalkley & Son's garage, Brand Street.

HOVE.—The Corporation are to erect 100 small houses on the Knoll Housing Estate.

HULL.—The Hull E.C. decided recently to apply to the Board for sanction to reserve a site of three acres of land behind the Training College on the Cottingham Road for the erection of an open-air school.

HYTHE.—Subject to the approval of the M.H., the Hythe Corporation will put in hand at the earliest possible moment another housing scheme, by which 68 houses will be erected in the Dymchurch Road. It is interesting to note that the total cost—and this sum includes sewers, fencing, electric lighting—is approximately £37,000. This works out at about £544 a house. The tender accepted is that of a Dover firm.

ILFORD.—Suburban Developments, Ltd., have prepared plans for the erection of 300 houses on the Springfield Drive Estate, Ilford.

KIDDERMINSTER.—The T.C. have approved the purchase of a site in Franche Road, where it is proposed to erect 50 houses; the tender of Mr. Coulson, of Dudley, has been accepted, at £749 5s. 2d. per pair.

KIDDERMINSTER.—The T.C. have adopted recommendations of the Parks and Buildings Committee for the erection of 50 houses on a site at Franche.

KILLMARSH.—Mr. Greensmith, of Messrs. J. & G. Wells, Ltd., recently stated at the annual dinner of that

firm that in the near future they anticipated building 600 houses at Killmarsh, 50 of which were in course of erection in the Upperthorpe district, from where it was proposed to construct a new road to Highmoor.

LANCASHIRE.—Mr. W. H. Schofield, county surveyor of Lancashire, has been appointed engineer-in-chief for the construction of the proposed Liverpool-East Lancashire Road, which will involve an expenditure of £3,000,000.

LEATHERHEAD.—The U.D.C. are to erect 26 houses in Kingston Road.

LEEDS.—The Leeds Corporation Improvements Committee estimate their expenditure on capital account during the ensuing year at £1,008,400 on street improvements, £600,000 on development and housing, and £25,500 on housing assisted schemes.

LEEDS.—The Corporation Gas Committee have approved plans submitted by Mr. G. W. Atkinson, architect, for the erection of new workshops and offices at the junction of New York Road and Bridge Street, at the estimated cost of £110,000.

LIGHTWOOD.—Messrs. Beckett & Bloore, architects, are preparing a scheme for the erection of a shopping centre in Stone Road, Lightwood, Staffs.

LONDON.—The L.C.C. has granted permission in respect of applications for the erection of the undermentioned premises:—Six houses in Glenesk Road, Eltham, by Messrs. J. G. & F. W. Francombe; 51 lock-up garages at Burnt Ash Hill, next Lee Railway Station, by Mr. S. F. Prior; 6 lock-up garages at No. 155, Burnt Ash Hill, S.E., by Mr. J. J. Hayes; house in Glenesk Road, Eltham, by Mr. R. Kevan; one-storey extension to Messrs. T. O. King & Sons' factory in Manor Lane, S.E.; two bungalows at the rear of Warren Avenue, Lewisham, by the Cawston Freehold Estates, Ltd.; house in Hervey Road, Blackheath, by Mr. C. G. Eaglen; 8 houses in Gerda Road, New Eltham, by Messrs. Stotesbury & Morris; 16 houses at Nos. 1 to 31 Crantock Road, Lewisham, by Mr. A. E. Thomas; 6 houses in Bexley Road, Eltham, by Mr. W. Childs; house at No. 97 Dunvegan Road, Eltham, by Mr. F. H. Buen; 43 lock-up garages with car showroom, etc., at Meadow Court Road, Lee Green, by Messrs. Purvis & Purvis; 4 houses in Chinbrook Road, Grove Park, by Mr. W. H. Stevens; house and two garages in Park View Road, Eltham, by Messrs. H. W. Stegg & Son; tennis pavilion in Coniston Road, Bromley, by Lieut.-Colonel E. P. Cawston; 16 lock-up garages at the rear of Well Hall Road and Eltham High Street, S.E., by Mr. R. Brown; addition to "The Hall," Bromley Road, Catford, by Mr. T. F. Ingram; "The Welcome Inn" public-house, in Well Hall Road, Eltham, by Mr. T. F. Ingram; garage at No. 60 Coniston Road, Bromley, by Mr. R. J. Owen; 2 lock-up shops in Westmount Road, Eltham, by Mr. S. Browne; 6 houses in Burnt Ash Hill, S.E., by Messrs. Eaglen Brothers; 19 houses in Charlton Road, S.E., by Mr. H. J. Lloyd. The L.C.C. has also granted permission in respect of the development of the housing estate of the Lewisham Metropolitan Borough Council at Grove Park, S.E.; and for

the erection of the Parish hall at All Saints' Church, Blackheath, by Mr. C. C. Winnill; house in Montacute Road, Catford, by Middletons (Builders), Ltd.; 53 houses in Exbury Road and River View Park, Catford, by Mr. A. Kirkham; house in Thorpe-wood Avenue, Sydenham, by Mr. F. A. Coppin; house and garage in Chartfield Avenue, Putney, by Messrs. Fawcett & Co.; 2 houses in Melrose Road, Southfields, by Mr. A. G. Hastilow; 6 houses in Leigham Court Road, Streatham, by Mr. E. W. Wallis; additions to the "Thatched Cottage," Mount Clare, Roehampton, by Mr. L. H. Smith; 20 houses in River View Park, Catford Hill, by Mr. P. H. Higgins; 4 houses in Dunoon Road, Forest Hill, by Mr. J. G. Hands; house in Lytton Grove, Putney, by Mr. C. Parkinson; lock-up shop adjoining No. 504 Upper Richmond Road, S.W., by Mr. G. E. Chandler.

MANCHESTER.—The preliminary work in connection with the building of St. Patrick's, Manchester, new girls' school has been started. The new school is expected to cost in the region of £20,000.

MANCHESTER.—The Corporation propose a vote of £207,000 in connection with the development of the Wythenshawe Estate.

MANSFIELD.—It is proposed to enlarge the Mansfield and District Hospital, at a cost of £50,000. Plans have been drawn up and approved by the Board of Management, and there are hopes that the building will be started during the year.

MERTON.—The B.E. have now approved the plans for the erection of the Merton Abbey School, which will cost £13,000.

MYNYDDISLWYN.—Plans have been prepared for the erection of 200 houses in this area. Extensive building operations are to be carried out at Pontllanfraith.

NEWHAVEN.—The U.D.C. have decided to erect 40 houses on various sites.

NORTHAMPTON.—The Corporation have prepared plans for the erection of 84 houses on the Weedon Road site.

NORWICH.—At Plumstead Street, Norwich, a new church is to be built in the coming spring.

PORT SETON.—The proposed erection of 52 houses in 13 blocks of four flatted houses by Cockenzie T.C. at Port Seton came before a meeting of East Lothian Western District Committee.

PURLEY.—Mr. F. W. Thomas is to erect 24 houses in Riddlesdown Road, Purley.

PWLLHELI.—The T.C. have decided on a third scheme of workmen's dwellings, and to have them completed in time to secure the present Government subsidy.

RUSWARP.—Mr. A. E. Young, architect, has been instructed by the honorary secretary of the Executive Committee of the Ruswarp Public Hall Fund to prepare plans and estimates and to obtain tenders for the building of the proposed hall in brick and stonework.

SALISBURY.—The Corporation are to erect 90 houses on the Stratford Road site.

Moss, Southend-on-Sea, £61,170 11s.; P. D. Hidden & Co., Ltd., Brentford, £61,411; Higgs & Hill, Ltd., South Lambeth Road, S.W.8, £63,300; Galbraith Bros., Ltd., Camberwell, £63,975.

KIDDERMINSTER.—The Corporation have accepted the tender of Messrs. Coulsons, Dudley, for the erection of 50 non-parlour type houses at £749 5s. 3d. per pair.

NOTTS.—The Notts Education Committee have accepted the tender of Messrs. Greenwood (Mansfield), Ltd., for the erection of a technical school at Mansfield at £30,347. The same firm's tender for a new school, headmaster's house, and caretaker's cottage at Bilsthorpe, at £21,189, was also accepted.

OKEHAMPTON.—For the erection of houses in the following parishes: Meeth, 10 houses, Messrs. Darch & Sons, £4,950; Okehampton Hamlets, two houses, Messrs. W. Ball & Sons, £989 15s.; Sampford Courtenay, four houses, Messrs. W. Ash & Sons, £1,928; Southtawton, six houses, Okehampton Building Co., £960 6s. 8d. for a block of two houses; Throwleigh, two houses, Messrs. H. J. Osborne,

£980; Broadwoodkelly, two houses, Mr. Fairchild, £496 10s. each.

RAMSGATE.—The Ramsgate Town Council recently accepted the tender of Messrs. Grummant Bros., Ramsgate, for the erection of one hundred houses on the Whitehall Estate, for the sum of £52,475, and application is to be made to the Ministry of Health for sanction to borrow that amount.

RAVENS COURT PARK.—Enlargement and improvement of the men's conveniences. Mr. Roy Gibson, £273.

RUISLIP-NORTHWOOD.—For the erection of two houses at the sewage works and four houses on the depot site, Pinner Road, for the U.D.C., the tenders of Universal Housing Co., £995 (two cottages) and £2,288 (four cottages), have been accepted.

TARPORLEY.—For the erection and completion of the Arderne Institute, Tarporley, the tender of Messrs. J. G. Davies & Co., of Frodsham, has been accepted, at £2,989, by the Cheshire E.C.

THAMES DITTON.—The following tenders have been accepted by the U.D.C. for the erection of houses on the Summer Road site: Mr. Langbridge: 22 houses, £8,250; Messrs. Rutherford & Woolford, 22 houses, £9,408.

TWICKENHAM.—Middlesex E.C. have accepted the tender, £40,676, of Messrs. Y. J. Lovell & Son, of Gerard's Cross, for the erection of a secondary school in Fifth Cross Road, Twickenham, and if this contract is not entered into, it will be offered to Mr. W. S. Try, Cowley, whose tender is £40,970.

WAKEFIELD.—The Wakefield T.C. are to erect 350 houses on the Snapethorpe Housing Estate, and the tender of Messrs. G. Cook & Sons, Ltd., has been accepted.

WELLS.—The tender of Messrs. Padfield & Co., of Wells, has been accepted for building five pairs of parlour and one pair of non-parlour houses for £6,719.

YORK.—For the erection of new club premises in Fishergate for the City of York Tramway Employees' Club and Institute, Ltd. Architect, Mr. B. Wilson, High Street, Tadcaster. William Birch & Sons, Spel Lane, York.

New Public Hall, Bayswater

Messrs. Perry & Co. (Bow), Contractors, of 56 Victoria Street, Westminster, have secured the contract for the erection of the new Public Hall, Library, and shops in Porchester Road, Bayswater, for the Metropolitan Borough of Paddington, to the designs prepared by Mr. Herbert Shepherd, F.R.I.B.A., 80 Queen's Road, Bayswater. The cost of the scheme is estimated at £86,000. The design provides for a building with Portland stone front to Porchester Road, and brick and stone to Queen's Road. This firm has also secured the contract for the construction of two re-inforced concrete deep-water quays on the Congo. The total estimate for the contract is nominally equivalent to £350,000.

It is the primary duty of a floor to carry efficiently the loads which may come upon it. Of the other duties of a floor the least spectacular but the most useful is that of accommodating the "domestic services." The Truscon floor will do this. Most buildings require gas and electric light, electric bells, telephones, and water supply. Heating systems, either radiator or "panel," have to be allowed for, and sprinklers or ventilating systems are often required. The Truscon floor has an accessible hollow space in which all these services can be effectually concealed.

*The Truscon Floor Book will
be forwarded on application*

The Dutch Industries Fair

The Dutch Industries Fair, to be held at Utrecht from March 15 to 24, will this year, for the first time, include a section devoted to the building trade. Tiles, bricks, roofing materials, asbestos, cement plates, materials for road building, etc., of Dutch manufacture, will be shown.

Window-Dressing Competition

An interesting window-dressing competition has been organised by Robert Ingham Clark & Co., Ltd., and R. Gay & Co., Ltd., in which three prizes and several consolation prizes are offered for the best display of the labelled products of the above two firms. The first prize takes the form of a silver cup and 20 guineas, the cup to be held by the winner for one year. By winning it three times (not necessarily consecutive) it will be won outright. A committee has been formed of representatives of the technical press to arrange the competition, which closes on April 14, and this is the latest date upon which photographs can be received.

Cardiff Building Trades Employers

The annual meeting of the Cardiff Association of Building Trades Employers was held recently, Mr. F. J. Thomas, A.I.O.B., presiding. The

secretary (Mr. Isaac Watkins) submitted the report of the Executive Council for the past year, which was approved and ordered to be printed, and the following officers were appointed for 1927:—President, Mr. D. W. Selby; senior vice-president, Mr. E. A. Ward, A.I.O.B.; junior vice-president, Mr. S. G. Symonds, A.I.O.B.; hon. treasurer, Mr. John Davies, A.I.O.B. (re-elected); hon. auditor, Mr. F. Holcombe. Messrs. D. W. Selby, F. J. Thomas, E. A. Ward, and S. G. Symonds were appointed to attend the National Federation annual meetings, to be held in London. Reference was made to the visit of the National Federation to South Wales, with headquarters at Cardiff, in July next.

Old Delabole Slates

It is difficult to visualise from one or two sample slates the colour effect that the roof will produce, and to assist in this direction Messrs. Setchell & Sons, Ltd., 26 and 27 Finsbury Court, London, E.C.2, have just published a series of colour reproductions of their various Old Delabole Slates, taken direct from the actual slates. Copies can be had on application.

Trade Catalogues Received

The High Wycombe Federation of Furniture Manufacturers. An invita-

tion is given to all furnishers to visit High Wycombe's display at the exhibition at Olympia from January 31 to February 10. A plan showing position of each stand will be found at the end of this brochure.

Trade Notes

Reduction in Glow-worm Prices

We are informed by Messrs. Bruster & Richardson, 4 Lloyds Avenue, E.C.4, that conditions in the industrial market are now such as to enable the prices of Glow-worm and wrought iron boilers to be reduced to the prices prevailing prior to December 1, 1926.

Building Trade Employer

At the annual meeting of the National Federation of Building Trade Employers, held recently in London, Mr. E. W. King, of Newport Mon., was elected president for the ensuing year in succession to Mr. F. D. Hodges, of Burton-on-Trent.

Hoardings complete	Per Foot Run 5/-
Planked gangway with handrail complete	4/-
Proper gantry complete	40/-
Sleeper roadways	8/-
Needling, strutting or shoring, including all labours and use and waste in erection and removal	Per Foot Cube 5/-

DEMOLITION

Pull down brickwork	Per Ft. Super reduced quantities 6d.	In considerable quantities 2d.
Add, if in very small quantities not exceeding 21 ft. out to carts	3d.	
Add for filling baskets with debris and running same	1 1/2d.	1 1/2d.
Add if debris has to be raised or lowered to ground level	2d.	Usually dropped
Add for cartage when same costs 4/6 per 1 1/2 yard load	2 1/2d.	2 1/2d.
Clean and stack old bricks	20/- per thousand	
Hack off old plaster	1/- per sq. yd.	

EXCAVATOR, CONCRETOR AND DRAINS.

Excavate in common soil, wheel, fill carts and cart away	Per Yard Cube 5 ft. 5 ft. to 10 ft. deep 9/6 11/- 9d.	Add if in trench 9d.
Planking and strutting	4d. per foot super.	
Planking, strutting and shoring	1/- " "	
Portland cement and ballast	1 to 6 29/6	1. 2. 4. 36/6
Concrete in foundations		2/6
Add if in ground floors	2/-	2/10
Add if in beams or lintels	3/-	4/-
Tested stoneware drains jointed in cement or standard iron drains jointed in lead, per foot run	Earthware 4 in. 2/- 6 in. 3/-	Iron 4 in. 3/- 6 in. 4/6
Extra only for bends, each	2/6	3/6
Ditto for junctions, each	3/6	4/3
Gullies, including concrete surround and iron grating, each	16/- 18/6	35/- 50/-

BRICKWORK (Exclusive of Pointing).

Built in 1 to 3 lime mortar	Per Rod Reduced Flettons 616/- Stocks 821/- Blues 1055/-	
" " cement mortar	636/- 841/- 1075/-	
Damp course	Per Foot Super Horizontal 10d. Vertical 1/3	
Two courses of slates in cement	9d.	1/-
1-in. asphalt		
Facings	Per Foot Super Flemish bond 1d. English bond 1d. plus 10%	
Allow for every 5s. additional cost of the facing bricks over the common brick basis		
Pointing (exclusive of scaffolding)	Per Ft. Super 2 1/2d.	
Weather joint in cement		1 1/2d.
Flat joint in cement (struck) and lime whitening		

ARCHES.

Extra over common brickwork	Per Ft. Super 1/-
In half-brick rings of bricks of same class as common brickwork	1d.
Add if of superior bricks for every 7/6 per thousand additional cost	6/-
In rubbed and gauged arches with fine joints	Per Ft. Run 1 1/2d. plus 10%
Quoins, angles, copings and sills of superior bricks	
Allow for every 5s. per thousand additional cost of bricks over the common basis price	
Double-tile creasing and cement fillets and pointing to 9-in. wall	1/2

PAVING.

Cement and sand	1 in. 3/- 1 1/2 in. 3/5	Per Yard Super 1 1/2 in. 3/10 2 in. 4/8
Granolithic	4/2	5/3
Asphalte	7/-	4/8
Tarmac		

MASON.

York stone and all labours and mortar in hoisting and fixing	Per Foot Cube 12/6 16/6
Artificial stone	9/- 8/-
Portland stone and all labours of usual character	To Elev. general 19/6
Bath stone ditto	10/6

SLATER AND TILER.

ROOFING.

Welsh slating laid to a 2 1/2-in. lap with two composition nails to each slate	80/-	72
Add for every 1-in. additional lap	2/3	3
Add for copper nails	2/3	3
Best selected green Westmorland slates laid to a 3-in. lap, with copper nails		1
Asbestos slates laid to a 3-in. lap, with compo. nails		
Asbestos corrugated roofing with galv. screws and limpet washers		
Plain red roof tiling 4-in. gauge, each tile in every fourth course nailed with two galv. iron nails		
Add for vertical work		
Add for circular on face in elevation		
Add for circular on plan, according to radius		
Add for circular on face in elevation and also on plan according to radius		
Old Delabole slates fixed complete—		
Size	Medium Grey	Medium Green
24 x 12 in.	90/-	93/-
20 x 10 in.	95/-	100/-
16 x 10 in.	86/-	91/-
14 x 8 in.	80/-	86/-
Green Randoms No. 2		115/-
Grey-Green Randoms		98/6
Green Peggies 12 in. to 8 in. long		87/6

Cuttings—Eaves	Per Foot Run Equal 1 foot 8 in.
Edges and abutments	Equal 1 foot 8 in.
Ridge tiling	1/10
Fixing soakers	9d. per dozen

CARPENTER.

Flat boarded centering, per yard super	
Centering to beams, per yard super	
Centres to arches, per foot super	
Fir framed in carpenter's work per ft. cube	Plates 4/- Floor 6/- Roofs 5/10
At per square	1 in. 1 in.
Deal plain-edged flooring	31/- 38/-
Deal tongued and grooved flooring	10/- 11/-
Roofing felt lapped and laid	12/- to 20/-
Gutter boards and bearers per foot super	

JOINER.

Per square	1 in. 1 in.
Deal close boarding	31/- 38/-
Deal tongued and grooved flooring	10/- 11/-
Deal matching	12/- to 20/-
Sashes, per foot super	1 1/2 in. 1/10
Deal moulded sashes, divided in squares	
Windows, per foot super	Very small Small Normal
Deal cased frames, 1-in. linings, 1 1/2-in. pulley styles, 2-in. sashes in squares, oak sill, double hung with pulleys, lines and weights	11/- 5/- 3/6
Doors, per foot super	2 Panel 2/3 4 Panel 2/5
Square frame both sides doors	2 1/2d. 3 1/2d. 4 1/2d.
Add for each side moulded	
Add for each side bead butt	
Doors of hardwood such as oak or mahogany, will cost three times as exclusive of polishing	
Staircase	
1 1/2-in. Deal tread, 1-in. riser, fixed complete per foot super	
2-in. Deal strings, per foot super	
Housing steps to strings, each	

LOWEST IN
FUEL
CONSUMPTION

GUARANTEED
"AGAINST"
BREAKAGE

How
Coal Strike
proved

the
Supremacy
of the

GLOW-WORM

has been established for a very long time that for raising abundant supplies of Hot Water and for economy in fuel consumption, no boiler can equal the Glow-Worm. It recently another feature of the Glow-Worm Boiler came prominently to the limelight. During the Coal strike the fuel available for Coke boilers was, and still is, generally of poor quality, carrying a heavy percentage of ash. No boiler, excepting those fitted with shaking bottoms, could be kept clear of ash, except of course by the exercise of extra strength than the average boilerholder cares to expend on stoking. Another feature of the

Glow - Worm's double base (or SHAKING BOTTOM) is that the ash may be removed without dust coming into the room. Moral: For the raising of Hot Water at the lowest possible cost for fuel and for ease in Stoking and labour-saving generally, you MUST install a Glow-Worm. No other boiler can possibly give you anything approaching the same amount of satisfaction. Added to which is the fact that all Glow-Worm Boilers carry a guarantee against breakage. The Glow-Worm is easily fitted to existing pipes, and pays for complete installation in less than two years. Prices range from £8/10/0.

TENTH MANCHESTER

Building Trades Exhibition

CITY HALL, DEANSGATE,

MARCH 29th to APRIL 9th, 1927.

THE whole of the ground floor space has now been allotted. There still remain a few good positions in the Gallery and these range in price from £9 0 0 upwards.

We still continue to receive numerous demands for positions, and early application is therefore advised.

A £200 Architectural Design Competition is being organised and Architects outside of the area of the Manchester, Liverpool, Burnley and Oldham Society of Architects should apply for particulars to the Competition Manager (Builders), City Hall, Deansgate, Manchester.

BUILDING WAGE GRADES

Grade Classification	A	A1	A2	A3	B	B1	B2	B3	C	C1
Standard Rates	1/8	1/7½	1/7	1/6½	1/6	1/5½	1/5	1/4½	1/4	1/3½
Labourers' Rates	1/3½	1/2½	1/2½	1/2	1/1½	1/1¼	1/1	1/0½	1/0¼	~1/11

The following are the gradings of towns in England and Wales. The rates quoted apply to all craftsmen, with the exception of those marked with an asterisk, which denotes that there is a differentiation in the rate paid to painters, details of which are given separately at foot. The London rates are:—Within a 12 mile radius from Charing Cross—all craftsmen (excluding painters), 1s. 9½d.; painters, 1s. 8½d.; labourers, 1s. 4½d. From 12 to 15 mile radius, all craftsmen (excluding painters), 1s. 9d.; painters, 1s. 8d.; labourers, 1s.

THIS IS AN ABBRIDGED LIST; THE GRADINGS OF OTHER TOWNS MAY BE HAD ON APPLICATION TO THE EDITORIAL OFFICE OF THIS PAPER

"LONDON'S LUNGS"

The exhaustive paper, which Mr. Frank Hunt, the Valuer to the London County Council, read before the Surveyors' Institution last Monday, will well repay study by all those who are interested in preserving London's amenities, its health and also its early efforts in enlightened town-planning. It is an odd reflection that now, when ordered town-planning has become an insistent necessity, we should be confronted by attempts to destroy what praiseworthy work has already been done in this direction. It is analogous to the complaint of Mr. J. C. Squire, the President of the Architecture Club, that while that Institution had been founded to stimulate good new building, much of their time and energy had had to be thrown into the scale of opposition to various proposals for destroying good, old buildings.

Mr. Hunt's survey was limited to the 250 garden squares, as distinct from street squares or squares round buildings, in the Metropolis; and the most important of them appear to have come into existence in the eighteenth century or the first quarter of the nineteenth century. The particular apprehension at the present time about their continuance, and all that it connotes, arises from the fact that the original building leases, under which they were developed, have fallen in or are about to fall in. The moment is then ripe for the speculator to offer tempting price to the ground landlord, based largely upon the possible use to which the unbuilt areas may be put; and having secured the property the public is confronted with the alternative of either letting some of its valued open spaces go, or paying a long price to retain them. With such an alternative we are confronted at the present time in regard to the Foundling Hospital property, an estate which, it may be remarked, was originally acquired and laid out by large gifts of money, not only from the charitable public, but also from Parliament.

The more important of the older London squares are governed, as to their management and upkeep, by various Special Acts of Parliament. The Foundling Hospital Squares, for example, come under an Act of 1794, and it would be interesting to know

how far the provisions of this Act tally with those of the Act of 1819 (and the subsequent Consolidating Act of 1851) affecting Edwardes Square, Kensington. In the case of Edwardes Square, the care of the garden was vested in the Garden Committee, whose right to possession was upheld by the Law Courts against speculators who had purchased it and adjacent property for building purposes. It seems probable that any squares, coming under special statutes such as this, have some such measure of protection; but in the case of Mecklenburgh and Brunswick Squares, the purchasers have promoted a bill in Parliament which will extinguish any rights or protection which those square gardens may enjoy in this way. The determined opposition of the local authorities, the London County Council, and the residents' association, to the proposed measure, encourages every hope that it will not be passed into law, however.

The legal position, however, in regard to the squares is somewhat obscure and uncertain; and the subject is too vast to be settled by piecemeal contests between owners and the public. The time has come for a general consideration and settlement of the matter of London's "lungs" once and for all. As Mr. Hunt pointed out, the decision of the Courts in the Edwardes Square Case, important as it is, does not cover the situation that would arise when all the leases of the houses in the square had expired, or when there were no resident householders, who, with the owner and his agent, are alone qualified to serve on the Garden Committee. The decision of the Judges, in the Edwardes Square Case does, however, point the way to a solution which may be drastic but, taking all the circumstances into consideration, does not appear to us inequitable. If the Acts of 1819, affecting that square, created a modification of the rights of the owner, provisions that were afterwards perpetuated by the Act of 1851, it seems fairly reasonable to suppose that the owners of that period acquiesced or were not inimical to the sterilization from building of part of their property for the enhancement and benefit of the rest. As Mr. Hunt observes, it "was an investment justified in its results, and for Parliament at this stage to say

that a no less generous scheme of development should obtain in future would not, in effect, be imposing any hardship upon the owners." The crux of the matter, as we have stated before in these columns, is really the limitation of profit. As the built-up portions of property round these squares have enormously increased in value, the question is whether the ground landlord is to be permitted to add to that increase an amount represented by the unbuilt areas valued at the same increased figure;

whether, in point of fact, the present owner is to be allowed to take a profit that never entered into the original calculations of his predecessors in title. Mr. Hunt's own conclusion, that we "have reached a stage when it can hardly be considered unjust to require by Statute the general preservation of the *status quo* so far as it relates to these garden enclosures," is one that we think will be re-echoed by the great majority of London's citizens.

Notes and Comments

The Royal Gold Medal, 1927

It is understood that the Council of the R.I.B.A. will recommend Sir Herbert Baker, A.R.A., to His Majesty the King for the award of the Gold Medal for Architecture this year. The formal announcement of the Council's choice will be made on Monday next.

The Export of French Architecture

The sale and exportation to America of our old buildings and fitments has met with considerable criticism; but a similar practice, which appears to have been growing in France, will be stopped if M. Henri Auriol has his way. As Deputy for the Haute-Garonne, he has introduced into the French Chamber a Bill to prohibit the taking away of parts of buildings of artistic value belonging to private owners in France; and his measure provides for the official classification of buildings of artistic value and also the seizure and restoration of fragments which it may be attempted to export. M. Auriol gives a curious example of the practice he complains of, which, rather unkindly, he has dubbed "Elginism." One house in New York City boasts cloisters made up of arcades taken from the Cloister of Saint Guilhem-le-Désert, the promenade of the exterior gallery of the Cloister of Trie in the Hautes Pyrénées, 26 capitals of pillars from another source, and several small columns, with capitals, from Bonnefont, near Trie, while other contributions were obtained from Saint Michel-de-Cuxa in the Pyrénées Orientales. Moreover, fragments of the Cloister at Bonnefont have been used in the external decoration of the same house. This passion for architectural fragments is truly American. We are informed that there have been built into the façade of one of the latest New York hotels stones taken from a large number of the most famous buildings in Europe. There is a stone from our St. Paul's, one from St. Peter's at Rome, one from Rheims, and so on. We feel sore when one of our old houses is carted bodily away; but this course is preferable to the nibbling of which the French politician complains.

Modern Art

Professor John Orr, of Manchester University, in opening an Exhibition by the Society of Modern Painters, endeavoured to explain to the public of his city some of the ideas lying behind what is called "modern" painting. He truly opined that "an outsider, who knew nothing about painting, might say, if asked for an opinion of the very diverse pictures in that Exhibition, that they were all alike in being extraordinarily unlike the objects which they set forth to represent. Such a crude impression had really a basis of genuine observation. It was, in effect, the unlikeness of the average view of an object which gave unity as to the diversity of modern painting." From this point, the Professor proceeded to consider to what extent such divergence was legitimate. Apparently the divergence relates not only to form, but also to colour, as "the modern artist refused to

be obliged to represent local colour even as he himself saw it in every normal mood." He treats it symbolically; he uses to express his emotion before the object. "It is not the colour he sees, but the colour he feels as he sees the object." So now we know Professor Orr's explanation is certainly more to the point than anything we happen to have read before. The breaking of the old conventions, he says, has naturally made the public resentful. The artists must not mind that; they should simply go on. Unfortunately, the Professor did not go on. He did not explain how, if you diverge from both the form and the colour of the object depicted, the public is to understand the painting. Is it to be supplied with a written description of the artist's emotions, or expected to be become proficient in thought reading?

The Kindliness of Kew

From time to time little stories creep into the Press about some useful or meritorious piece of public work carried out by that branch of the Government service known as the Royal Botanical Gardens at Kew. Few of the people, we suspect, who stroll about those very beautiful grounds are aware that a great deal of useful and patient research work goes on there; and fewer still, perhaps, know that the great Malay rubber industry owes its inception to work done at Kew. Kew now appears as a fairy godmother to that lonely island of Tristan da Cunha, the windswept treeless island in the South Atlantic, becoming better known, perhaps, through recent broadcast lectures. There the housing difficulties are even greater than they are at home; and apparently the first step of young couples bent on matrimony in the island is to catch sufficient driftwood on the shores to provide material for the shack which is to constitute their future home. As a result of patient investigation by Mr. Douglas M. Gane and the operation of Dr. Hill, the Director at Kew, several packages of young New Zealand willows and poplars previously planted and brought forward at Kew, have now been despatched, in the care of the two missionaries who recently went out there, for replanting in the island, as a first attempt at afforestation. Previous parcels of ornamental shrubs and hedge-growing plants were sent out in 1922, but what happened to them is not yet known. This is Kew's first attempt at creating a flora on a barren island, for in 1850 they supplied packages of young shrubs, trees and plants for Ascension Island, which is now fertile and fruitful.

The Thames Bridge Report

Judging from recent reports, the attitude of the London County Council towards the Report of the Royal Commission on Cross-River Traffic will be largely determined by the question of finance. They have now asked the Prime Minister to receive a deputation on the subject, presumably with the object of discovering whether the Government is going to implement the Commission's recommendations by raising the funds required to carry out its proposals.

THE ELEVENTH CHURCH OF CHRIST, SCIENTIST: CORRIDOR TO AUDITORIUM.
OSWALD P. MILNE, F.R.I.B.A., Architect.

THE ELEVENTH CHURCH OF CHRIST, SCIENTIST, LONDON

Yet another Christian Science Church has been completed, and it is becoming evident that a certain convention is being established, an architectural symbol by which we are immediately enabled to recognise a church of this nature. For architecture cannot live by "expression" alone, because expression is entirely determined by utilitarian function, and this function can often be performed in so many different ways that its fulfilment does not create a clearly recognisable type of structure. A building should never present a puzzle to the passers-by. When we see a church spire in England we can fairly safely assume that the church belongs to the Anglican communion. The spire does not express Anglicanism, but by the establishment of the convention that only Anglican churches have spires, immediately on seeing a spire we jump to the conclusion as to the nature of the church. One of the functions of architecture is to aid the public in the recognition of the purpose of every building erected in a town. It is commonplace that a town hall should look like a town hall, a theatre should look like a theatre, a shop like a shop, and so on. And it is a corollary of this doctrine

that a Christian Science Church should look like a Christian Science Church. It was obvious, therefore, that it would only have created confusion if such a church were adorned by a spire.

Let us now examine this particular building, the 11th Church of Christ, Scientist, which has just been completed to the design of Mr. Oswald P. Milne, F.R.I.B.A. The first thing to notice is that it is a brick building set in a district where its immediate architectural neighbours are also brick. The colour of the bricks is pleasing, a variegated red and purple, of which the former predominate. Opposite the front of the church in Nutford Place is a block of fairly modern flats built in red brick, while on one opposite flank in Seymour Street is a pleasant late 18th century tenure of small brick houses, and on the other flank in Brown Street is a building of brick with stone facings. This is fortunate, for the church is thus seen by its very colour of texture to belong to its architectural environment.

In the main façade in Nutford Place the most prominent feature is the gable end decorated with blind machicolation, of which the centre portion is

THE ELEVENTH CHURCH OF CHRIST, SCIENTIST, LONDON. OSWALD P. MUSE, F.R.I.B.A., Architect.

THE ELEVENTH CHURCH OF CHRIST, SCIENTIST, LONDON. OSWALD P. MILNE, F.R.I.B.A., Architect.

THE ELEVENTH CHURCH OF CHRIST, SCIENTIST: THE ENTRANCE PORTICO.
OSWALD P. MILNE, F.R.I.B.A., Architect.

brought forward slightly and encloses a large round-headed window having brick reveals with stone architraves inset. On the ground level, entrance is obtained through a broad portico in the form of an arcade with five bays. The arches of the portico are again set in brick reveals with stone moulded architraves, and are borne by engaged Corinthian columns separated by substantial piers. Subsidiary windows are placed each side of the centre projecting portion of the façade. Two small flat-roofed wings complete the composition, which is rendered all the more striking by the conspicuous stone corbels which support the upward tilt of the eaves.

The side elevations towards Seymour Street and Brown Street are almost identical. In each case there is a symmetrical composition with a row of five windows flanked with projections on either side, each containing one bay. The first-floor windows are rectangular, and are surmounted by a parapet, above which we catch a glimpse of five other windows belonging to the main building behind. The ground-floor windows are round-headed, like those in the front elevation, which are in brick reveals with stone panelled architraves inset. The windows are glazed in lead left dark grey, while in the semi-circle are placed small round glazed apertures with a decora-

tive pattern of panes, surrounded by a plain band of stone which is given a background of brick arranged in herring-bone formation. Beneath the ground floor is the basement which, however, is provided with an external courtyard at its own level, approached by steps from the end nearest the front of the building. A handsome wrought-iron railing separates the courtyard from the pavement of Seymour Street. A similar arrangement has been followed in Brown Street. Both these elevations are highly attractive and provide a simple and elegant solution of the somewhat difficult problem of fenestration which was here presented.

Even in the rear elevation, which is not intended to be visible and which will, in fact, not be seen when the site at the back of the church has been developed an attempt has been made to achieve an orderly arrangement of the windows.

The interior of the church is excellently planned. The pews are arranged in tripartite division, with two gangways in the main body of the auditorium and additional ones at the sides giving access to rooms behind the platform and at the same time providing exits. These corridors are outside the main body of the auditorium and are separated from it by a row of elegantly detailed Corinthian columns. The focus

THE ELEVENTH CHURCH OF CHRIST, SCIENTIST: THE ENTRANCE PORTICO.
OSWALD P. MILNE, F.R.I.B.A., Architect.

attention is, of course, the platform, which is rendered conspicuous by being set in front of a large apse, panelled in wood, framed in fluted pilasters, which are surmounted by a broad architrave enclosing the semi-circle.

Above the latter radiate lines, in star pattern, which fill up the interval between it and the flat ceiling. On either side of the apse are grills comprising long narrow vertical apertures, in each of which is placed a decorative brass vertical rod. The grills conceal but yet adequately express the organ, which is thus incorporated into the architecture of the room. This treatment of the organ is a highly original feature which has not hitherto been adopted in other places of worship. It remains to be said that the design and craftsmanship displayed in all the details of the building are excellent. Much care has been expended on the planning of the apartments subsidiary to the main hall of worship, and we are left with the impression of a modern design very well conceived and efficiently executed.

Messrs. Dove Brothers, Ltd., were the general contractors. The following is the list of subcontractors: May Construction Co., Ltd.—acoustic plaster, cabot quilting insulation to floors and ventilating ducts; Patent Victoria Stone Co., Ltd.—artificial stone staircases; The Dorking Brick Co.—

NEW NEEDS AND MODERN NOTIONS—VI

By EDWIN GUNN, A.R.I.B.A.

PIPES.—It must be very depressing to be a plumber or hot water fitter, for though everyone wants them to do good work, nobody wants to see it.

This journal has recently contained a series of sermons from Mr. Trystan Edwards on the text of decency in external plumbing, and it is quite time that architects ceased to delude themselves that soil pipes and bath wastes in conspicuous positions can be ignored as elements of a building as easily as they can be omitted from drawings. An uncomfortable position for a soil pipe should be sufficient reason for abandoning an otherwise hopeful plan, but it is only necessary to instance one of the placed designs in the recent *Daily Mail* competition to demonstrate common neglect to consider this.

It should also be remembered when a roof containing attics lit by dormer windows is part of the design, that it will be necessary to carry up the soil pipe as a vent to a height of three feet above the head of any window. Evidences of failure to realise this need are visible constantly in lead soil pipes crawling like huge worms up roof slopes and dormer cheeks. Chimneys contrived at suitable points furnish a relatively unobtrusive way of supporting and masking tall soil pipe ventilators. Cases have been known where an extra flue has been added to a stack specially to contain a lead soil pipe, the bottom of the flue at ground line being open on one side to the external air. This is seemly but expensive, and would be inapplicable to a cast-iron soil pipe.

In the past it has usually been possible to keep within bounds the straying of internal pipe services, but the recent popularity of bedroom lavatories and radiator heating has caused pipework formerly confined to sculleries and bathrooms to invade the whole house. Personally, I do not like the bedroom lavatory, for the same reason that I do not like the "accidental" wireless outfit—a love of tidiness. An arrangement by which a small washing closet is provided for each bedroom overcomes my objection, and for a separate bathroom to each bedroom, I have nothing but praise—where the money will run to it. But, even so, it is essential that such arrangements should be planned for with intent to minimise the pipiness of the important fronts externally and of the rooms within. Radiator circuits, if not thrown in at the eleventh hour (as many clients are inclined to do), can usually be schemed to avoid anything beyond an occasional drop pipe in prominent places. The adoption of the modern drawn copper pipes, with their neat clips and fittings, is a great help towards minimising the obtrusiveness of essential services. Many houses now incorporate built-in gas fires in most of the rooms, and though these have now developed so that sightly models can be obtained to meet every need, the actual connection to the house supply still offers difficulties. Neither a brass pipe bent to an offset travelling round the chimney jamb, an iron pipe sticking up through the hearth with an elbow and connector to the fitting, nor a length of flexible helical tubing from a floor cock, are altogether worthy of admiration on their own account. The ingenuity of the gas-appliance makers might profitably be turned to an improved means of connecting-up.

While on the subject of gas fires, the point might as well be mentioned that the customary trimming with brick arch or concrete slab is hardly necessary in the case of a bedroom gas fire. This is recognised by some of the makers of cast-iron gas mantels, who embody a small cast-iron hearth as part of the fitting, intended to overlay the floor. A similar device, with

a small raised hearth slab of tiles, slate, or marble works well in ordinary cases of built-in interiors with surrounds of similar materials.

SANITARY FITTINGS.—Flushing tanks, or water waste preventers, are of three main types, requiring different treatment when actuating. I can see no reason why makers should not recognise this in the same manner as the makers of stoves, who cast thereon in raised letters such inscriptions as "Open for quick draught," or "Close for slow fire." The commonest type of flush is that embodying an annular syphon which is brought into operation by the surge caused by the descent of a heavy bell. The directions should be "Pull chain and release smartly." The second and increasingly popular type embodies a cylinder and plunger which, on the pull of a lever, forces water over the syphon, which once started continues to draw the contents by the operation of a valve. This type is usually that adopted in so-called noiseless flush tanks. Its inscription should be "A steady pull to operate." The third type (objected to by many water companies, and tending to become obsolete, as it embodies a valve which permits steady leakage and waste when out of order) starts the syphon by admission of water direct to the long leg through a weighted plug valve, which is raised by the pull of the chain. The direction for this type should be "Pull, and hold a moment." A further type of water-waste preventer—the Lovelock—has advantages in some positions, but anyone proposing to instal one should ascertain that it is acceptable to the Local Water Authority.

Whatever views may be held on jointless flooring elsewhere, there is strong reason in favour for W.C. and bathroom floors, which then permit the fitting to be placed directly thereon with no further floor covering. Linoleum fitted round a W.C. pedestal leaves a poor joint just where any joint is unwelcome. Baths of the closed-in riser kind, which are now regaining popularity after a period of insistance on naked forms, are certainly capable of neat and clean treatment, and as the bath top is now part of the bath, do not allow the hidden space between bath and riser to become the foul receptacle for stale soap suds, which the old mahogany top encouraged.

[Editor's Note.—This is the last of the present series by Mr. Edwin Gunn. Further articles will appear at a later date.]

New Ways and Means

*The Editor will welcome early information of
New Plant, Materials and Fittings*

A New Pipe Fitting Accessory

The pipe vise, which we illustrate, is of a new inclined side-opening type which releases the pipe (so that it can be lifted out) with one turn of the handle. The frame is made of malleable iron, which has been put through a slow annealing process and can be guaranteed against breakage. The jaws are of tool steel, hardened and tempered, and can be replaced after hard service; they are designed to grip the pipe securely without danger of squeezing it, and will "open up" enough to take a 2-in. standard coupling so that short nipples can be handled. This pipe vise is made by Messrs. The Oster Manufacturing Co., of Cleveland, Ohio, U.S.A., and has been introduced to the British market by Mr. J. Rickard, of 8 Victoria Avenue, Finchley, N.3.

The "Oster" Pipe Vise.
(The Oster Manufacturing Co.)

A New Flooring Cramp

A new floor cramp for working on solid foundations as well as open joists has been introduced by Messrs. Richard Melhuish, Ltd., of 50-51 Fetter Lane, London, E.C.4. As will be seen from our illustration, this cramp consists of a thrust screw actuated by a reverse action pawl and ratchet lever passing through a clearance hole in a guide formed in the main frame. A special nut-fitting on this screw is brought up to the frame by hand, giving a quick action and final adjustment ready for pressure being applied by the ratchet. With floors of the ordinary type on open joists, or of breeze with concrete filling, or any solid foundation into which a nail can be driven, this cramp can be laid direct on the joists or on the breeze, steel pins being driven through the holes in the arms of the cramp to keep it in position. The pressure applied by the ratchet tends to produce a downward pressure at the base of the cramp, with the result that there is very little pull on the pins, which give the necessary support without being driven too deep into the foundation. This cramp will hold from 5 to 10 boards at one set-

The "Hickley" Floor Cramp.
(Richard Melhuish, Ltd.)

ting, and by placing the last boards in position, right up to the wall, the cramp may be placed on them and put into use, using the wall to thrust from. Its utility, however, does not end here, for the thrust screw, pawl and ratchet lever being in one unit, separate from the frame, can be put into service as a light mechanical jack when mounted in a small stand, which can be supplied by the makers.

A Bath and Heater Combined

A novelty in the way of a cheap bath installation for tenements and bungalows, where no provision for a bathroom and boiler has been made, is being introduced by Messrs. R. P. Opass & Co., of Coventry House, South Place, London, E.C.2. This bath, known as the "Hydro" Self-Heating Bath, can be placed in any room where gas is laid on, and takes up no more space than is actually required for the bath to stand in. It requires no tanks, hot-water pipes or other fittings, except for the connection of the outlet, cold water being run direct into the bath and heated in it. The bath itself is of the usual metal construction and shape, 5 feet 6½ inches long, mounted on four short pedestal legs and fitted at one end with a waste water outlet. The outside is painted except for a central galvanised strip along the bottom, beneath which, extending the whole length of the bath, is the gas burner fitting used for heating the water. This burner consists of a length of pipe pierced with a double row of holes so arranged that the gas flames come into direct contact with the bottom of the bath, whilst the floor is protected from the heat by means of a curved metal plate, 10 inches wide, extending the whole length of the burner and mounted 2 inches below it. The burner can be connected up to the gas-point by either flexible or ordinary gas piping. Ten gallons of water can be brought to "bath" temperature in twelve minutes at a cost of under one penny

for the quantity of gas consumed, and although the bottom of the bath necessarily gets warmer than the water whilst the gas is alight, it will be found that the temperature is quickly equalised when the gas is turned off.

A Novelty in Window Fittings

A simple window catch applicable to sliding sashes has just been placed on the market by Messrs. The Little Brown Window "Dog" Co., of 36 Abbey Street, Hockley, Birmingham. This device is intended to be fixed on the left-hand side of the lower sash, as illustrated, in which position it allows the window to be left open for ventilation, but prevents it being opened any further by persons outside

The "Little Brown" Window Dog.
(The "Little Brown Window Dog" Co.)

the house. The "dog" is put into action by pushing over the pivoted bar so that its serrated edge rests against the woodwork of the upper sash, into which the teeth will bite if any attempt is made to push up the lower sash or pull down the upper one. The fitting is made of pressed steel with an oxydised finish, and is quickly fitted by means of screws.

The manufacturers of the "Unity" Patent Floor Bridging, noticed in our issue of January 28, are also supplying these units, bent to shape, ready for fixing.

The "Hydro" Self-Heating Bath.
(R. P. Opass & Co.)

HOUSE AT FRINTON-ON-SEA.

C. F. A. VOYSEY, Architect.

C. F. ANNESLEY VOYSEY

The Man and His Work—III

At the time Voysey began building, the domestic life of the upper middle classes had lost the colour which is preserved to us in the pages of Thackeray and, more strongly, in Dickens' picture of Dombey's house and the Merdles's and the Podsnap's, where, we may remember, certain choice guests were invited to a heavy ceremonial dinner-party and others, less choice, to a ceremonial "haunch of mutton vapour bath" after dinner. Thackeray, in the pretended personality of Titmarsh, depicts similar scenes of heavy feeding when, in the *Book of Snobs*, he describes how, whenever he sees a jelly or trifle being removed from table to furnish forth another banquet, he always calls for it and "massacres it with a table spoon." In Voysey's early days mahogany curtain-poles and sideboards with decorations like tadpoles and worm castings (the best the machine could then achieve) glued upon them, had gone the way of the wax fruit and wool mats that preceded them. Gone were the grained doors, the statuary marble chimney pieces, polished steel grates, heavy hangings and carpets, and the cast-iron gas-chandeliers hanging from lumpy foliated plaster bosses which matched the massive unfeeling cornice. Gone was the crinoline, and the "bustle" with which Western ladies sought to rival the posterial luxuriance of the hottentot was in its full glory. The huge mantelpiece—Vikings—right-hand Viking looking to the left, left-hand Viking looking to the right—may be said at that time to be the almost sole active survivals of the stuffy, feelingless, mid-Victorian domicile. In London, at any rate, the Willet house was replacing Cubitt as a popular expression of vernacular domestic architecture.

Voysey, when he looked about him as a young man, saw heavy luxury giving way to a richness no less luxurious, though chastened and refined. Curtain-poles were no longer glorified, but became inconspicuous rods; thick dust-harbours hangings were being replaced by more cheerful and wholesome ones. Graining and marble mantelpieces gave place to paint

and richly moulded wood, with tiled surrounds to the grate. "Yallery Greenery," the "Æsthetics," "Patience," neutral-tinted plush upholstery—all these greeted him as the things most conspicuous and most new; and, particularly, did stamped and embossed wall linings force themselves upon his attention. These were endemical in all self-respecting new houses of that time, as distemper is endemical in well-bred dogs. Such linings were specially favoured below the chair or dado rails, and above the frieze or picture rails, without which rails the reception rooms of a gentlewoman's house would have looked almost as indecorous as the gentlewoman herself would have seemed had she received a guest there without wearing a "bustle" to do it in. Sometimes these embossed linings, bronzed or gilded, over-spread the whole surfaces of walls and ceilings, and broke out in the door panels like a confluent chicken-pox. I have a shrewd idea that even Norman Shaw let himself go in this way once or twice, and Morris's work of this kind at Stanmore Hall, photographs of which I have lately happened on, so dumbfounds me that I can only ejaculate—like the railway guard who got into a luggage-van where was a Blue Vinney Cheese—Oh, my! In those days severely botanical studies of flowers were painted on the panels of doors, and similar tributes to natural history were paid, on a blue ground, to lengths of drain pipes set on end to serve as umbrella stands. Yes; it is easy to make fun of all this, but the reader must remember that he would have taken it all seriously enough if he had been living in those days. Such gifted men as Norman Shaw, Nesfield, and E. J. May were, unless I am much mistaken, ringing the changes on these devices and ideas. Morris was shaping loveliness when he found all ugly, but it was Voysey who swept the whole thing away and gave architects new ideas to play with and new ideals to inspire them in their conception of small house design and of the relation of the architect to that kind of work.

HOUSE AT BEACONSFIELD.

C. F. A. VOYSEY, Architect.

The impulse of Voysey's innovation was simplicity, coupled with individualism. In 1916 he published a book on "Individualism," but long before this, in 1895, when replying to a discussion on a lecture, I find him saying, "Individualism has no chance if precedence is to be our guide." I shall give a much truer idea of what is represented in Voysey's work if I quote from some of his own expositions of the principles underlying it than could be conveyed by any detailed account of the buildings which have been chosen to illustrate these articles.

"Simplicity in design is analogous to sincerity in character. The desire to be simple is borne of the desire to be true. Complexity and duplicity are first cousins. True richness of design is quite compatible with simplicity, but elaboration and complexity are not. True richness requires that the reality shall be as true as the appearance, for things must be what they seem. The richness must arise from nobility and profusion of thought and feeling. True richness depends on quality, not quantity. Accumulation of forms, colours, and textures will often produce what the ignorant and superficial will mistake for richness, but careful observation will quickly dispel the delusion."

"The exercise of individual choice must result in the unconscious expression of the individual character of the designer. The moment this expression of individuality becomes conscious it becomes forced, and is what we call affectation."

"Try the effect of a well-proportioned room, with white walls, plain carpets and simple oak furniture, and nothing in it but the necessary articles of use, and one pure ornament in the form of a simple vase of flowers; not a cosmopolitan crowd of all sorts, but one or two sprays of one kind, and you will then find reflections begin to dance in your brain; each object will be received on the retina and understood, classified and dismissed from the mind, leaving you free as a bird to wander in the sunshine or storm of your own thoughts."

"Floors without floorboards can be formed of wrought joists with concrete partition-slabs laid on the top of them, and floated over on the upper surface with hard plaster or one of the many patent jointless floor coverings or rubber tiles."

"This kind of floor construction needs no lath and plaster ceiling; distempering between the beams com-

pletes it. Skirtings can be made with glazed tiles, set flush with the plaster, or, if preferred, black marble, unpolished, or blue pennant Bath stone or hard vitreous unglazed tiles can be used instead. All that is particularly needed is a border three inches high, and hard enough to withstand the carpet sweeper. The initial cost would be found to balance the expense of the old-fashioned wood skirting, with its grounds and space behind for mice and perpetual need of cleaning and painting. The kind of construction herein advocated, though eliminating much of the carpenter's and joiner's work, adds great lustre and importance to that which remains, and so the carpenter and joiner become important factors in the æsthetic and practical values of the building."

As an example of the vehemence of Voysey's convictions, I cannot refrain from quoting him on electric bells. In doing so, I would pay tribute to his sense of the value of hyperbole. By ruthless over-statement he makes it impossible for anyone to forget the comparison which favours the earlier pulled-bell.

"To be touched gently on the shoulder is better than a stab in the back, and no one wants to be told so, yet we endure the electric bell which stabs the sound out of one impersonal gong. In days gone by the wire-pulled bell was responsive to the master's touch, and the servant felt at once the temper of the master in the tone of his call. Each room, too, had its distinctive voice, and the servant knew, without looking at any index, who was wanting him, but with electric bells there is no distinction possible; all users are assassins."

The illustrations which have appeared with the two previous articles, and which accompany this, have been chosen from a very large number of designs; and if they do not show the best examples of Voysey's work they represent, in my opinion, buildings which are characteristic of the designer and typical of those that most arrested attention when they were first built, and that are now recognised as signalling the individuality of the architect. I find in a cutting from *The Studio*, which, however, does not inform me of its date, nor of the particular subject of comment, the following note of one of these Voysey the fullest appreciation of its perfect composition houses: "One of Mr. Voysey's most charming creations in domestic architecture is published in *The Architect* for November 8, and we reprint it with

"THE ORCHARD," CHORLEY WOOD.

C. F. A. VOYSEY, Architect.

and its exquisitely English domestic quality." And in 1899 *Country Life* gave a page description of a house which Voysey was then only building. This is the house at Chorley Wood, illustrated in these pages, in which Voysey was not only his own architect, but his own client, and it seems to me to be a memorable achievement and characteristic of the best he did and of the best he taught. Of all that has been since done in a field which was then new, it is difficult to recall anything of the kind more entirely successful, and if *The Studio* note above quoted refers to this house, it is as just to-day as it was discerning when it was penned. The little house stands in an orchard; it is an English home. It expresses itself without any suggestions borrowed from the past; it relies upon no traditional associations in its architecture: with complete modesty, directness and simplicity it appeals by abstract qualities which are inherent in the craft of building. We catch exactly the same delightful sentiment of reality in the cottages we see at Bibury. I cannot imagine anyone who would wish to alter this little house in any single particular of detail, except possibly that of the buttresses; and when it is remembered that no experienced eye could view it from a distance of even a quarter of a mile and not recognise its authorship, we get, in some degree, a measure of its designer's genius.

In the next number I shall avail myself of Voysey's suggestion, say "What I do not like about his work," and point out "How bad it is."

Royal Academy Summer Exhibition

The Summer Exhibition of the Royal Academy this year opens on Monday, May 2, and closes on Saturday, August 6. The dates for receiving works are as follows: Water colours, pastels, miniatures, black-and-white drawings, engravings, and architectural drawings, Friday, March 25; oil paintings, Saturday, March 26, and Monday, March 28; sculpture, Tuesday, March 29. The hours for the reception of work are from 8 a.m. to 10 p.m. (except Saturday, March 26, 8 a.m. to 2 p.m.). Not more than three works may be sent by any one artist. Labels and forms may be obtained, during the month of March only, from The Secretary, Royal Academy of Arts, Piccadilly, W.1.

Coming Events

Hampshire Architectural Association. — Friday, February 11.—General Meeting and Lecture at Portsmouth.

Town Planning Institute.—Friday, February 11.—Major Harry Barnes, F.R.I.B.A., on "The Slum Problem." Caxton Hall, Westminster, S.W.1. 6 p.m.

The Royal Institution.—Friday, February 11.—Mr. Ernest Law, C.B., on "Old Hampton Court Palace Revealed." 21 Albemarle Street, W.1. 9 p.m.

Royal Institute of British Architects.—Monday, February 14.—Business Meeting. Election of Members. 9 Conduit Street, W.

Birmingham Architectural Association.—Friday, February 18.—Annual Dinner.

The London Society.—Friday, February 18.—Mr. H. Avray Tipping, F.S.A., on "Nicholas Hawksmoor, a London Architect." (Lantern Slides). John Street, Adelphi, W.C.2. 5 p.m.

Yorkshire Town Planning Institute (North of England Division).—Friday, February 18.—Meeting at Leeds. To be addressed by Mr. G. L. Pepler.

Edinburgh Architectural Association.—Monday, February 21.—Mr. W. A. M'Cartney, A.M.I.C.E., on "Some Things We Might do Better."

Liverpool Architectural Society (Inc.).—Wednesday, February 23.—Miss Mary Adshead on "Modern Decorative Painting." (Lantern Slides).

South Wales Institute of Architects.—Wednesday, February 23.—Mr. W. S. Purchon, M.A., on "The Work of Sir Christopher Wren."

Association of Architects, Surveyors and Technical Assistants (Midland Counties Division).—Friday, February 25.—Mr. B. J. Aston on "A Review of Modern Wall Decoration." Birmingham Chamber of Commerce.

"Birmingham Gazette" Brighter Homes Exhibition.—Birmingham, February 8-19.—Particulars from Provincial Exhibitions, Ltd., City Hall, Manchester.

The Second Edinburgh Housing and Building Exhibition will be held at Waverley Market, Edinburgh, from February 9 to 19, 1927. Plans and details from: Mr. T. Percy Bentley, Exhibition Offices, 7 Waverley Market, Edinburgh.

Manchester Building Trades' Exhibition.—March 29-April 9.—Particulars from Provincial Exhibitions, Ltd., City Hall, Manchester.

BUNGALOW NEAR CHICHESTER. JOHN D. CLARKE, F.R.I.B.A., Architect.

BUNGALOW NEAR CHICHESTER. JOHN D. CLARKE, F.R.I.B.A., Architect.

THE EDINBURGH HOUSING EXHIBITION

On February 9 the Second Edinburgh Housing and Building Exhibition opened at Waverley Market, Edinburgh. The exhibition marks a distinct advance, both as regards importance, variety and number of exhibits, over the first one, held in February, 1926. Many exhibits of great interest are to be found, and below we give, under a general classification, a short description of some of the stands.

In the concrete plant section, Messrs. Goodwin, Barsby & Co., Ltd., Leicester, have an interesting display of their Patent Acme Stonebreaker (the machine designed for breaking any stone); their Acme Victor Concrete Breaker; and their Open Drum Concrete Mixer. The Chalmers-Edina Co., Leith, show examples of the Edina products, including their Colonial Piston Pump; Diaphragm Lift and Force Sewage Disposal Pump; and specimens of their Centrifugal Pumping Set (with paraffin engine) and Concrete Mixer with petrol engine. The exhibit of R. H. Kirk & Co., Newcastle-on-Tyne, although only consisting of nine types of their machines, is yet representative of a range that will cover any special requirement, particularly as they cater solely for the builder and concrete manufacturer. The latest example of a Hoisting Mixer (Fowler 6/4) is shown by John Fowler & Co. (Leeds), Ltd., and those with an appreciation of economy values will be rewarded by a study of their other exhibits, particularly the Plaster Mixer. The Liner Concrete Machinery Co., Newcastle-on-Tyne, show examples of their "A" type "Liner" Patent Concrete Stone-moulding Machine and Mechanical Stacker. This, it is claimed, is the only double-unit moulding machine on the market that makes and mechanically stacks cast stone. Messrs. Winget, Ltd., are showing a model of their pier and panel walling system, and a feature of the machinery exhibits is an open drum mixer, which it is claimed has solved a problem that has hitherto baffled concrete engineers. The trouble with most mixers, especially those of the open drum type, is that it is difficult, if not impossible, to obtain a concrete of maximum strength with the drier mixes which are favoured by present-day concrete engineers. The problem, they state, has been solved in the present case chiefly through the special Burn-Lancaster Drum.

In the section which deals in a general way with plant, mention must be made of Scaffolding (Great Britain), Ltd., London, who are giving demonstrations daily showing the advantages attaching to the use of tubular scaffolding, comprising patent sprocketed steel tubes, patent reinforced putlogs (which eliminate putlog holes), suspended scaffolds and "Scaffixer" scaffold ties. The Acme Patent Ladder Co., London, exhibit a large variety of their well-known Acme patent extension ladders, in various patterns and sizes, and Drew, Clark & Co., London, examples of the "Diamond" patent extension ladders in two and three sections. The Midland Saw and Tool Co., Ltd., Birmingham, demonstrate the ideal builder's machine—the "Mid-saw" Universal Woodworker.

Under the heading of materials, mention must be made of J. & W. Henderson, Ltd., Edinburgh, whose exhibit shows a representative range of roofing and building slates; L. Keizer & Co., Ltd., Leith, who show the practical application of plywood in walls of refinement and artistic panelling; and Reaper & Burton, Edinburgh, who, showing the productions of the Door Unit Co., Ltd., London, give demonstrations of the simple operations of installing the unit. This firm also show the products of the Standard Metal Window Co., West Bromwich. The Caledonian Trading and Transport Co., Ltd., Leith (agents for Self-Sentering Expanded Metal Co., Ltd., 112 Cannon

Street, London, E.C.4), give many examples of their well-known products. King Craig & Co. (building material merchants), London, show examples of Hardwood Doors, namely, mahogany, oak, teak, Baltic pine and Columbian pine, apart from many other building materials.

W. G. Walker & Sons, Ltd., asphalters and tar macadam contractors, Edinburgh, have their well-known products divided into three sections: roofing, paving, and dampcourse respectively.

Lifts are represented by Etchells, Congdon & Muir, Ltd., Manchester, whose interesting exhibit is a representation of an electric lift as it might appear in the entrance hall of a public building; and The Express Lift Co., Ltd., Glasgow, who exhibit one of their standard driving gears, and also show their latest model of a small electric service lift, suitable for restaurants, hotels and private houses.

In the section devoted to heating, the pessimist, depressed by the English climate, may find encouragement by an examination of the exhibits of Baxendale & Co., Ltd., Edinburgh ("Homestead" Hot Water Interior and the Super Interoven Convertible Cooking and Heating Stove); Allan Ure & Co., Glasgow ("Ure Back-to-Back" Grate, shown in operation); A. Stevenson & Co., Leith ("Weldun" Boilers, "Hot Cross" Boilers, etc.); and M'Dowall Steven & Co., Ltd., who show in action the "Janus" Back-to-Back living-room grate and scullery cooker.

Copper tubes and fittings are shown by The Yorkshire Copper Works, Ltd. (examples of "Yorkshire" copper tubes for hot and cold water pipes); and James H. Lamont & Co., Ltd., Edinburgh, who demonstrate their improved fittings for light and heavy gauge copper tubes.

M'Donald & Creswick, Ltd., Edinburgh (architectural metal work in bronze and iron) state they are prepared to develop architects' suggestions or to submit original designs for metal work of every description.

The Vacuum Cleaner and Domestic Appliance section is strongly represented by Hurley Machine Co., London (an exhibit of "Thor" products); British Vacuum Cleaner Co., Ltd., London (the Turbinet Electric Cleaner, the Brivac Hand Cleaner, and the Goblin Non-Electric Suction Sweeper); Electrolux, Ltd. (cleaners and refrigerators), London, show "Electrolux" models suitable for flats, mansions and hotels; and Vampires, Ltd., London, give practical demonstrations of the ease with which the "Vampire" Vacuum Cleaner can be used.

Under the heading of office supplies, mention must be made of George Waterston & Sons, Ltd., Edinburgh, who show everything that can possibly be required for the contractor's office.

In conclusion, mention must be made of the fact that the City of Edinburgh Corporation has assisted in the alleviation of the housing shortage as follows:—(a) building houses, (b) financial assistance to community schemes, (c) subsidising houses built by private enterprise. The houses already provided by the Corporation are erected on sites that have been acquired, namely:—Gorgie, Abercorn, Wardie, Lochend, Saughtonhall, Easter Road, Bangholm, Longstone, Corstorphine, Gilmerton, Davidson's Mains, Leith. In addition, further sites have been acquired at Prestonfield and Corstorphine, on which it is proposed to commence the erection of over 700 houses. This year Messrs. Henry Boot & Sons (London), Ltd., have contented themselves with showing an example of one of their famous small model houses.

It is obvious that in the absence of a Building Exhibition in London, the value of Provincial Exhibitions is very considerably enhanced.

ST. MICHAEL'S CHURCH, LITCHFIELD (CONNECTICUT): VIEW FROM SOUTH-WEST.
ROSSITER AND MULLER, Architects.

“A MEMORIAL CHURCH IN NEW ENGLAND”

St. Michael's, Litchfield, Connecticut. Rossiter and Muller, Architects

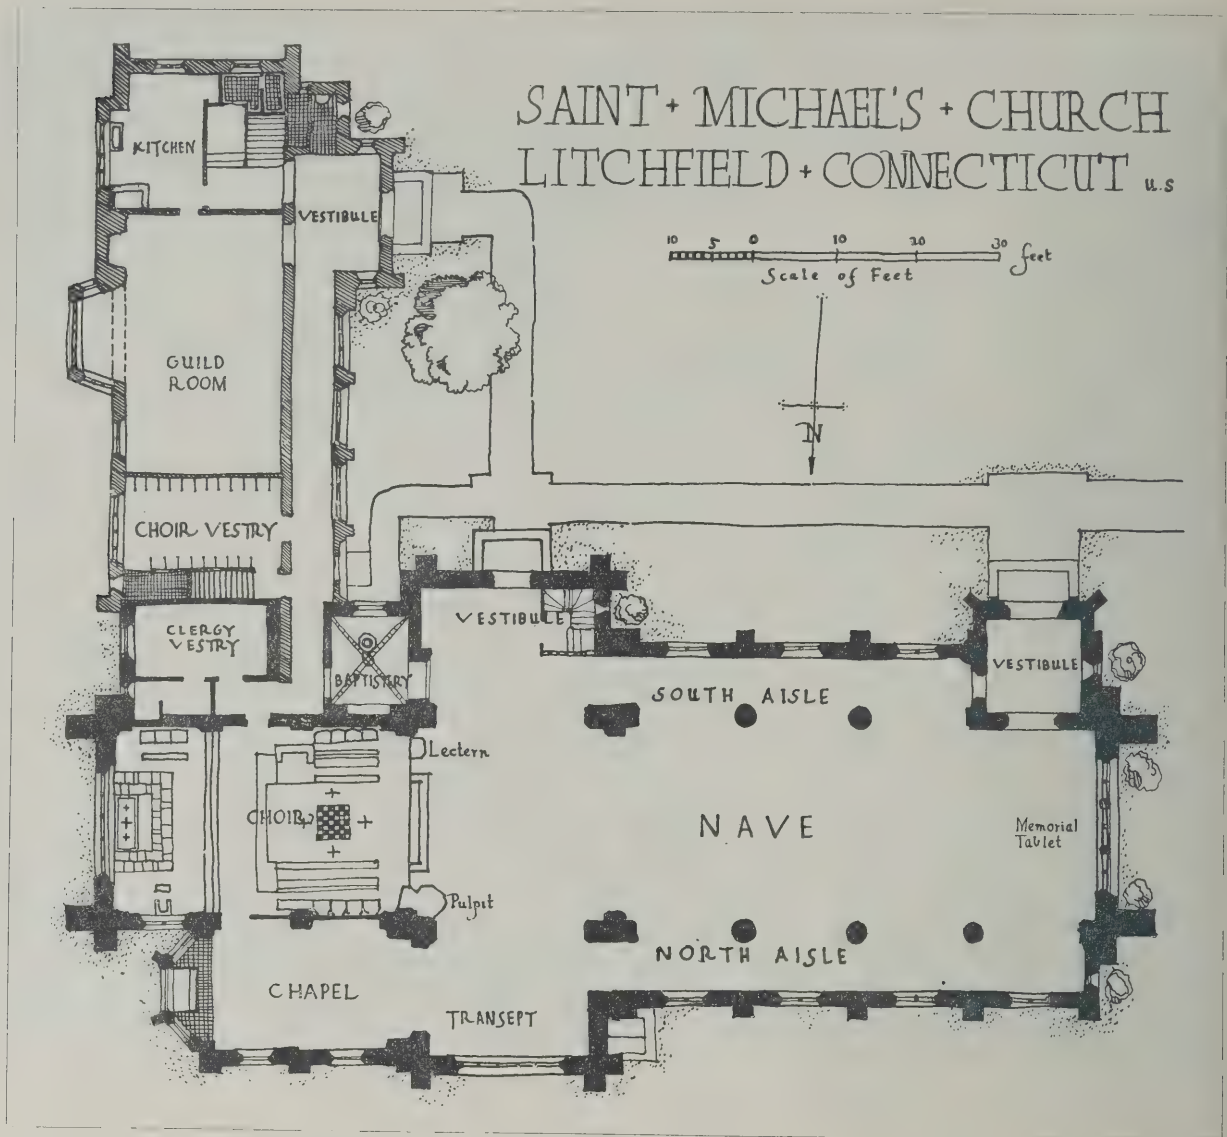

For a good many years Gothic architecture has had an undisputed supremacy in the United States as a style for ecclesiastical buildings, and its employment has equally become almost a tradition for schools, colleges and universities, though there are still some of the latter, such as Harvard University of Cambridge, Massachusetts, which are a stronghold of the Colonial rendering of the Classic.

The still unfinished cathedral of St. John the Divine is an instance of the victory of Gothic in gaining public approval, for this, the largest effort in the United States in modern church building, was originally begun in a free rendering of Byzantine, and it was only comparatively recently, after difficulties had arisen between the authorities and the architects, that the work was turned over to Ralph Adams Cram, who is continuing it in Gothic.

Excellent and sincere as is the work of Cram, it yet shares with that of most of the modern American Gothic exponents a certain quality of mechanical hardness and lack of emotional interest. There is always evidence of conscientious book study, and of discriminating selection; but too often one has the impression that the architect has been merely working in the Gothic style, while the Gothic style has been in no wise working in the architect. Nothing can be more cold and dull than a precise and correct Gothic, as we know to our cost in England. And,

of course, in America there are further difficulties in the lack of tradition in craftsmanship and materials.

It is pleasant, therefore, to be able to turn to an example of the modern American church which seems really to have captured the mediæval spirit, and which achieves that mixture of dignity, friendliness, and spirituality which is so often found in our best parish churches in England. It is an atmosphere of character to which time is inevitably an important contributor, and it is all to the credit of the architects of St. Michael's that they have been able in a new building to capture these elusive qualities so successfully. No doubt the setting was a helpful one—Litchfield is a charming old country-seat—and there is a suggestion of repose and protection in the tall trees which, consciously or not, seems to have inspired the designers in their exterior. The central tower, for instance, is calm and stable in its solid massing, devoid of finials or other restless features, and the east end, with the rich tracery of its window, flanked by deep buttresses conveys an atmosphere of security and protection. There is a very good quality of thought and much real feeling in this particular piece of design, which is appreciable when one recalls the many instances of mean-looking east windows with paltry and mechanically designed tracery and buttresses—which appear rather to be hanging to the church wall rather than themselves contributing to support.

St. Michael's is a Memorial Church, erected by a parishioner to the memory of his wife, and the choice of Gothic was the outcome of agreement between the donor and the architects, in spite of the fact that Litchfield contains many admirable examples of American Colonial architecture; generally speaking, the style is modelled on the so-called Decorated period.

Apart from the question of style and character, the problem was to seat a congregation of approximately 400 (exclusive of accommodation in choir and chapel), and this has been managed by the traditional plan of a nave and side aisles, giving the usual advantages from the standpoint of internal treatments, and having also the old defects of this plan-type in respect of visibility and acoustics.

The plan shows agreeable proportions and a pleasant balance of parts. The actual dimensions of the nave, including the side aisles, are 40 feet by 80 feet, and the chancel 22 feet by 36 feet.

It will be noted that the south side of the church has been designed with deference to erecting a parish house, to be placed contiguous to the present clergy vestry. The proposed wing will give weight and importance to the main mass of the church, and will add a greater significance to the dominant note of the central tower. Here again the plan shapes and proportions are excellent.

The choice of a suitable stone for the exterior received very careful consideration, it being desired to obtain a good deal of diversity of tone, and the success of the architects in this matter is apparent

from the photographs. The stone used was obtained from an old abandoned quarry in Connecticut; it is of very imaginable hue of grey, with an intermixture of ochres running the whole gamut from yellow to brown, and the result is one of warmth and cheerfulness. The avoidance of monotony has been carried into the roof, which is covered in slates of graduated sizes and varied colours, and which approaches much more closely to the effect of a good English roof than do most American examples, which are apt to be either too hard or over "textured." The interior stonework is bush-hammered, and it combines well with the plastered surfaces, the oak roof trusses, and the rest of the roof timbers, which are in a native chestnut, a timber which is fast disappearing from New England.

The floors of the nave, chapel, and baptistery are laid in 9-in. by 9-in. terra-cotta quarry tiles, but directly under the pews the flooring is formed of oak boards. A special tile with symbolic designs based on some Early Christian pavements has been used for the chancel, and the floor of the sanctuary is in a pale Sienna marble.

The architects have paid particular attention to the woodwork in the chancel, and the pulpit and stalls are elaborately worked and contain some very good detail, which suffers only from the fact that it pays too close a tribute to European prototypes. Perhaps the day will come when Gothic in the United States will be infused with some native American motives and will assume that distinctive

character which the Colonial work possesses. At present there is almost too great a respect for traditional models.

The interior treatment generally is exceedingly simple and dignified, and does not suffer from that impression of having been designed too much on the drawing-board. There is a very good feeling for materials and craftsmanship, and it is a fortunate thing that the architects were not obliged to incorporate in their new design memorials, coming from an older church, which might not have reached the artistic standard of the detail in the new building. Very wisely, this problem—always a delicate one for both church committee and architect—was most happily solved by the donor of St. Michael's, who added to the plan of the church a chapel in which could be housed the memorial windows and tablets contributed by parishioners of an earlier day, leaving free the wall spaces and traceries of the church proper.

The building of a church in America probably calls for as much love, and even more tact, than it does in England. In any case, few American architects seem to have carried out the task of creating a sympathetic modern rendering of the mediæval church tradition with greater skill and understanding than the architects of St. Michael's, Litchfield.

Book Review

The Law of Building and Engineering Contracts and of the Duties and Liabilities of Engineers, Architects, Surveyors and Valuers. By A. A. Hudson, K.C., assisted by Lawrence Mead, Barrister-at-Law. Fifth Edition. London: Sweet & Maxwell, Ltd. Price £3 3s. net.

The ordinary layman contemplating building without professional assistance could be excused on being shown this bulky volume were he to jump into a cab and drive straight to the nearest architect like a ship seeking shelter from a storm. Building operations of any magnitude, of course, are always placed in the

ST. MICHAEL'S CHURCH, LITCHFIELD (CONNECTICUT):
THE INTERIOR. ROSSITER AND MULLER, Architects.

hands of an architect, but there is, nevertheless, a growing tendency nowadays, doubtless on account of economy, for a building owner to carry out the erection of a modest dwelling or even minor works "on his own"; but there is such a thing as being "penny wise and pound foolish." The "points" which are in the habit of cropping up so unexpectedly in connection with any business undertaking are many enough, but there surely can be no professional or commercial enterprise so beset with dangers or fraught with difficulties as building or engineering, and this makes a knowledge of the law relating to the subject so necessary to ensure the building owner, on the one hand, against claims for additional payment, and the contractor, on the other hand, against loss arising from inaccurate or vague description of the work and obligations to be undertaken by him.

To those for whose benefit this work has been written, it is a veritable mine of information, and should have a place in the bookcase of every architect and surveyor. Apart from the chapters on pure law, there are others which deal with the respective duties of architects, engineers, builders and surveyors, and such practical subjects as tenders and estimates, approval, certificates and extras. A careful study of the chapter on contracts would well repay architects and builders for their trouble, if only to establish a better acquaintance with the judicial interpretation of words and phrases commonly employed in such documents which, if loosely used or misapplied, are sure to lead to trouble.

The author and his assistant are to be congratulated upon the improved arrangement and classification of this, the fifth edition, which is now published in one volume instead of two. The second volume of the fourth edition, which comprises reports of cases, precedents and forms which it was not considered necessary to revise or reprint, forms an appendix to the new edition of Volume I, and the publishers announce that a number of copies of the second volume of the fourth edition are still available for sale with the new volume.

ST. MICHAEL'S CHURCH, LITCHFIELD (CONNECTICUT):
THE EAST END. ROSSITER AND MULLER, Architects.

BUILDING CRAFTSMANSHIP—OLD AND NEW—VI

By Nathaniel Lloyd, F.S.A.

Fig. 1.

Fig. 2.

About the middle of the 18th century, bay and oriel windows became fashionable, and for many years provided scope for the carpenters' craft, many more being executed in wood than in brick or other material. Bays the whole height of a building, like those at Cupola House, Folkstone (Fig. 1), were perhaps the most popular type, but that illustrated has two uncommon features, one being that the cornices increase in depth (and consequently the members in scale) the further they are from the eye, the other that the friezes are enriched with flutes and pateræ. The semi-circular oriel windows of the first and second floors of a house at Colchester (Fig. 2) is in a later manner, the detail of which is interesting. The whole is supported by consoles, but the ground floor under has been converted into a shop front.

NOTE.—The term "carpenter" will be used to include "joiner," as frequently done in the 18th century.

THE CRAFT OF THE CARPENTER

By Nathaniel Lloyd, F.S.A.

From a house at Colchester. The segmental oriel is well designed and beautifully detailed. The interlacing of the glazing bars in the segmental sash-heads is original and pleasing. The windows above appear to be contemporary, but each is a separate unit, unconnected with those above and below. The simple oriel on the angle (from a small house at Deal) seems to have been designed to command views down both streets.

This charming little semi-elliptic bay at Rye faces the Town Hall. Its sill is less than 2½ feet from the pavement, and it is possible that it may have been designed as a shop window, for which purpose it has recently been used. The delicacy of the mouldings add to its refined appearance; only the side lights open.

LONDON SQUARES

At the Surveyor's Institution, last Monday, Mr. Frank Hunt, C.V.O., F.S.I., Valuer to the L.C.C., read an important paper on "The Garden Squares of London." The paper, which is too lengthy to be given in full in our columns, commenced with an historical retrospect, from which it would appear that the formation of garden squares was, in general, restricted to the development of large estates, which, at the time of their development, were the high-class residential districts of that period. In some cases, on small estates, they were actually intended as a garden enclosure for the benefit of the houses immediately abutting thereon. St. James's Square, Leicester Square, and Bloomsbury Square appear to have been the pioneer squares of the West End, in which the garden square appears to have been an original institution.

The case of Edwardes Square is rather typical of many other London squares. Under the Kensington Improvement Act of 1851, which superseded an Act of 1819 (and other Acts relating to this, Brompton Square, and the Norland Estate), it was provided that the maintenance and keeping in order of the square and the garden and shrubbery therein, a garden committee was to be constituted, consisting of the owner of the garden and his agent and male inhabitant householders assessed or liable to be assessed to the "garden rate." Such committee was to have, exclusively, the care, management and regulation of the garden. In 1903 the square, with other property adjoining, was sold, and when, in 1910, the leave of the square, granted in 1820, expired, the new owners took possession of the garden enclosure, boarded up the gates, and locked out the residents. The garden committee thereupon applied to the Courts for a declaration that they, under the Acts of 1819 and 1851, were entitled to the exclusive care, management and regulation of the square for the use of the resident householders. On the other side, it was contended that the valuable reversion could not have been taken away by Acts which gave no compensation. It was held in the Court of Chancery that the Act of 1819 created a modification of the rights of the owner until the statute was repealed, and that the Act of 1851 perpetuated the provisions. Judgment was given in favour of the committee (July 26, 1910), upheld by the Court of Appeal (November 7, 1910), and finally confirmed on further appeal to the House of Lords (January 22, 1912). This decision is not only of importance as affecting the future of Edwardes Square itself, but the future of all squares subject to statutory provisions of the same or a similar character. Mr. Hunt stated that the decision did not decide what the position would be when the leases of all the houses in the square had expired, or when there were no resident householders; but as the Acts were permanent Acts, there is good ground for thinking that even this would not leave the owner free to use the square as a building site. Other parts of the address dealt with the London Squares and Enclosures (Preservation) Act, 1906; other squares preserved by statutory provision (as Bloomsbury Square) or by gift; and squares destroyed. It must suffice, however, to give Mr. Hunt's views on the future of the London squares:—

It is no doubt true that in the hands of enlightened owners there is little risk of the original intentions of those who were responsible for the first layout of the estate being thwarted by the garden enclosures being built over. But the experience in the case of Mornington Crescent, Endsleigh Gardens, Edwardes Square, and more recently in the case of the squares

on the Foundling Hospital Estate, indicate that there may be a serious risk of new purchasers not being animated by the same generous desire for preserving the amenities of the district, and attempts might be made to utilise the garden enclosures for purposes for which they were not originally intended.

Another aspect of it was the possibility of a public authority seeking powers of management which would enable them to throw open these garden enclosures to the general public. There is no doubt that this opening of the enclosures would raise considerable antagonism in some instances from the persons living in the houses adjoining. It is, however, pleasant to record the fact that in some of the valuable districts of London, during the period of the children's school holidays, several of these garden enclosures are made available for the enjoyment of the poorer children of the locality.

I think it is essential, therefore, that for the success of any scheme which would aim at securing from building the garden enclosure in question, it should not be complicated by an attempt to secure that these enclosures should be opened at all times for the use of the public.

There probably remains only one section of this subject for consideration, and that is, Is it possible to secure the preservation of these enclosures, and, if so, by what means?

It is, I think, essential, in approaching this problem, to bear in mind that the provision of these garden enclosures was an integral part of the original lay-out of the district in question. The surrender of the land for the purpose, as for the formation of the roads separating them from the houses overlooking them, was an investment justified in its results, and for Parliament at this stage to say that a no less generous scheme than the original scheme of development should obtain in future would not in effect be imposing any hardship upon the owners. It may be quite true that if owners were permitted to build on the sites they might obtain substantial sums of money thereby; but so, indeed, might be the argument in the case of generous widths of roads, such as are found in Westbourne Terrace, in Cromwell Road, and elsewhere. Here it might be said there is no necessity for roadways of more than about one-third or one-fourth the existing widths, and if limited to this the land so recovered would possess a high value. This, however, would hardly justify an owner in feeling a grievance because he is not permitted to curtail the width of these broad highways if he so desire.

So long as owners were prepared to continue the management of them as at present they should be kept, if so desired, closed against the general and indiscriminate use by the public; but the local authority should be empowered, if so desired by the owners, to take over the management and control of these enclosures, and if they thought fit, under proper control, open them to the general use of the public.

The problem, apart from the general interest which has been raised by the risks threatening some of the existing garden squares, becomes more important in view of the intimation of the Minister of Health that he hopes at an early date to enlarge the powers of local authorities to control the built-up areas by extending thereto in some form the principles of the Town Planning Acts. Such an extension will present problems of the greatest magnitude; but perhaps the greatest problem of all, so far as London is concerned, will be that associated with the preservation of those special features of the better-class development of the Metropolis to which we have devoted our attention to-night.

WHY YOU CAN HAVE IMMEDIATE DELIVERY OF ROOFING TILES!

OUR works at Marseilles have a total annual output of 250,000,000. From these figures one can easily realise why we always have a stock of 1,000,000 tiles spread over our 20 depôts throughout England and Wales. As fast as tiles leave our depôts for the jobs, so ships are being loaded at the works, and unloaded at our ports. Herein lies the essence of our slogan:

“IMMEDIATE DELIVERY.”

LANGLEY LONDON LIMITED
161 BOROUGH HIGH STREET, LONDON, S.E.1

MARSEILLES ROOFING - TILES

London Building Notes

BASINGHALL STREET.—The depot of the Aerated Broad Co., Ltd., Camden Town, N.W.1, at the corner of Basinghall Street and Gresham Street, E.C.2, is to be rebuilt.

BRENTFORD.—Several of the works of the Brentford Gas Co. are in need of reconstruction. This work is to be taken in hand by the company's engineers.

BRIXTON.—A row of shops is to be built on a site at the junction of Brixton Road and Stockwell Road, S.W. Nineteen shops are to be built, and operations on the first section of the block are being carried out by Messrs. James Smith & Sons, Ltd., South Norwood Junction, S.E.25. The plans of the building have been prepared by Messrs. T. P. Bennett & Son, 41 Bedford Row, W.C.

CROYDON.—Extensions are to be made to the drapery sales and showrooms in North End, Croydon, of Messrs. Kennards, Ltd. The architects are Messrs. T. J. Evans & Son, Newgate Street, E.C.

CROYDON.—A move is likely to be made in connection with the proposals of the Governors of the Whitgift Grammar School, Croydon, to erect new school buildings. It is possible that the question of plans may be the subject of an architectural competition.

EDGWARE.—The Canons Park Estate has been sold to Mr. F. W. Bristow, of 5 The Vale, Golders Green, N.W.11., who intends to lay out and develop the area for building purposes.

FENCHURCH.—Alterations are to be made to the office and showroom premises situated at Nos. 4-5 Fenchurch Street, E.C.3. The architects are Messrs. Grace & Farmer, 3 Wardrobe Place, E.C.4.

FOREST GATE.—The Queen's Cinema Theatre at Forest Gate, E., is to be enlarged by building a large balcony. Mr. Clifford Aish, Architect, 22 Bedford Street, W.C.2, acting on behalf of the Suburban Super Cinemas, Ltd., the owners.

HAMPSTEAD.—A block of flats is being erected on a site in Finchley Road, N.W. This building has been designed by Messrs. A. & D. Ospalak, 25 Victoria Street, Westminster, S.W.1. The builders are Messrs. William Moss & Sons, Ltd., of Loughborough.

HOLLOWAY.—The premises of Messrs. Jones Bros., Ltd., drapers and general providers, are to be extended by the construction of an arcade which will link up two existing buildings. Further premises are also to be equipped as a grocery, etc., department.

HORNSEY.—The Vicar and Wardens of St. George's Church in Priory Road, N., have under consideration plans prepared by Mr. W. C. Waymouth, F.R.I.B.A., 104 High Holborn, W.C.1, for the extension of their buildings.

ISLEWORTH.—The newly formed Isleworth Conservative Club propose to purchase Garvin House in Twickenham Road for a proposed club house. The chairman is Capt. N. Scott Beatty.

KENNINGTON.—A start has been made upon the site of the new "Oval"

Telephone Exchange, which is to be erected at a cost of about £20,000. The builders are Messrs. Galbraith Bros., Ltd., 63 Waterloo Street, S.E.5. Plans have been prepared by H.M. Office of Works, Storey's Gate, S.W.1.

KENNINGTON.—Work has commenced upon the re-building at Springfield School at Kennington, S.E., upon which the London County Council propose to expend some £40,000. The general builders are Messrs. J. & C. Bowyer, Ltd., Weston Street, Upper Norwood, S.E.19. Mr. G. Topham Forrest, F.R.I.B.A., architect.

KENSINGTON ROAD.—A block of buildings is to be erected on a site bounded by Kensington Road and Melbury Road, S.W. Plans have been prepared by Messrs. Joseph, 2 Pauls Bakehouse Court, Godliman Street, E.C.4.

KENSINGTON.—It is proposed to erect a block of shop property for letting purposes on the site of the old Honiton Street Chapel.

KINGSTON-ON-THAMES.—The Surrey E.C. have approved the proposal of the governing body of the Tiffins' Boys' School to build a new range of classrooms, etc., at a cost of about £10,000-£15,000. Messrs. A. W. Jarvis, A.R.I.B.A., and F. A. Richards, F.R.I.B.A., architects, 60 Tufton Street, Westminster, S.W.1.

MARYLEBONE.—A site, covering about 3,000 square feet, at the corner of Euston Road and Bolsover Street, N.W.1, is to be developed for building purposes, and schemes for the utilisation of the land are now being drawn up. A block of shops, with offices above, is projected, the surveyors being Messrs. Cuthbert Lake & Sutton, of Stone Buildings, Lincoln's Inn, W.C.

MARYLEBONE ROAD.—The governors of the Western Ophthalmic Hospital, Marylebone Road, N.W., will probably initiate their rebuilding scheme at an early date. A complete new hospital will be erected, costing approximately £40,000. Messrs. Young & Hall, Architects, 17 Southampton Street, W.C.

MORTIMER STREET.—Demolition is practically complete of the old West Wing of the Middlesex Hospital, which is the first portion of the institution to be dealt with under the £500,000 reconstruction scheme. The contractors will be Messrs. Holland & Hannen & Cubitts, Ltd., 256 Gray's Inn Road, W.C., who will commence operations under the direction of the Hospital architect, Mr. A. W. Hall, F.R.I.B.A., (Messrs. Young & Hall), 17 Southampton Street, W.C.2.

MERTON.—A new science block is to be built at the Rutlish School at Merton, S.W., at a cost of about £10,000. Messrs. A. W. Jarvis, A.R.I.B.A., and F. A. Richards, F.R.I.B.A., Architects, 60, Tufton Street, Westminster, S.W.1.

RICKMANSWORTH.—The Non-Inflammable Film Co., Ltd., 3 Regent Street, W.1, propose to extend their factory buildings and equipment at Rickmansworth. The cost is estimated at £225,000.

ROMFORD.—Alterations are to be made at the Crown Hotel at Romford, owned by Messrs. Ind Coope & Co., Ltd., brewers, Burton-on-Trent. The work will be carried out by Messrs. Baker, Hammond & Laver, Ltd., New Road Works, Rainham, under the direction of Messrs. Banks-Martineau, Hammond & Co., architects, 40 High Street, Romford.

SOUTH KENSINGTON.—The Ladies' National Club have purchased a residence in Collingham Gardens, South Kensington, S.W., which they propose to equip as a hospital for paying patients. Accommodation will be provided for about 20 beds.

VICTORIA.—It is proposed to build a new cinema in Vauxhall Bridge Road and Wilton Street. The promoters are a new company, Belgrave (Victoria), Ltd.

VICTORIA STREET.—Land in Victoria Street and Brewer Street, S.W.1, is to change hands, and important building developments are expected to take place. The negotiations are in the hands of Messrs. Henry Holmes & Co., Surveyors, 82 Mortimer Street, Oxford Circus, W.1.

WEST END.—Messrs. Arnold Phillips & Co., estate agents, 151 Charing Cross Road, W.C., are enquiring for a site in the West End with an area of about 14,000 square feet, which is required for building purposes.

WESTMINSTER.—A block of office premises is to be built in Petty France, S.W.1. The new premises have been designed by Messrs. Searle & Searle, A.R.I.B.A., Paternoster House, 34 Paternoster Row, E.C.4.

WESTMINSTER.—Plans have now been completed for the block of flats to be built on the site in Willow Street and Greycoat Street, S.W.1, for the Westminster City Council. The cost is estimated at £30,000. The architects are Messrs. H. V. Ashley & Winton Newman, F.R.I.B.A., 14 Gray's Inn Square, W.C.2.

WHITECHAPEL.—Negotiations are proceeding for the disposal of St. Mark's Church in Tenter Street, E., with a view to the development of the site for commercial purposes.

WILLESDEN.—New premises are to be erected in Colin Road, Willesden, N.W., for Messrs. A. E. Dean & Co. Plans have been prepared by Mr. G. A. Sexton, L.R.I.B.A., Bank Chambers, 42 High Road, Maida Vale, N.W.6.

Midland Building Trades Employers.

The annual general meeting of the Midland Federation of Building Trades Employers was held recently at the Grand Hotel, Birmingham. The President (Mr. S. Guy Sapote) took the chair, and there was an attendance representing 20 affiliated local associations. The officers for 1927 were appointed as follows: President, Mr. W. W. Webster (Northampton); vice-presidents, Mr. W. Bosworth (Nottingham), Mr. C. S. Kershaw (Burton-on-Trent); treasurer, Mr. Ralph Webb (Birmingham); hon. auditors, Mr. S. F. Swift (Birmingham), Mr. W. Kendrick (Walsall).

The Hall Mark of Your Craftsmanship

WE have already commented on how the actual user will appraise the standard of your Craftsmanship by the quality of the accessories used in the installation. Such quality must be in evidence, not only in serviceable utility, but also in the harmonious design of the visible parts—e.g., the switch covers.

It is here you can add the Hall Mark of your Craftsmanship, the visible evidence of the underlying excellence by the use of our "Shelloid" Switch Covers, which, in their variety of colours—

GOLD TORTOISE-SHELL AMBER CRIMSON
SILVER IVORY LAPIS LAZULI CORAL

confer just that desired touch of harmonious distinction your customer will be quick to appreciate.

We were the first to introduce these artistic covers, and the ever-increasing demand is eloquent testimony to their popularity. Combined with the "Crabtree" Base Rings, they set the seal of excellence, always maintained by—

"Craftsmen
in
Electrical
Switches."

G. P.

A SUGGESTION

MAY we suggest that before purchasing Fireplace Suites or Sanitary Appliances you and your Clients should visit our recently re-arranged Showrooms at 17 & 18 Upper Thames Street, London, E.C.4.

The range of Fireplace Suites offered for inspection is a very wide one. A special feature is the number of beautiful Period Designs, many of which we owe to our own craftsmen of a century ago.

The Register Grate illustrated is in Armour Bright finish and fitted with the Hot Hearth Fire. It is particularly suitable for office or country house use.

The Week's Building News

The following abbreviations are used: U.D.C. for Urban District Council; T.C. for Town Council; R.D.C. for Rural District Council; E.C. for Education Committee; B.G. for Board of Guardians; P.C. for Parish Council; B.C. for Borough Council; M.H. for Ministry of Health; M.T. for Ministry of Transport; C.B. for County Borough; B.E. for Board of Education. Direct confirmation should be obtained before commitments, for which we cannot be responsible, are made.

ABERYSTWYTH.—The Corporation is to erect 10 non-parlour houses and 40 parlour houses at Penparke.

ALDERSHOT.—The T.C. is to make application to borrow £69,123 for the erection of 128 houses in Aldershot Park and King's Road.

ALDWYCH.—Four new theatres, a restaurant, and cabaret are to be built at Aldwych, if the L.C.C. gives approval to proposals which have been made. Plans have been prepared of the whole building scheme to designs in keeping with Bush House, and it is estimated that the buildings alone will cost over half a million pounds.

ASHTON-UNDER-LYNE.—The Corporation have decided to erect 92 more houses of the non-parlour type.

BATH.—The Bath City Council recently approved the erection of 280 additional houses for the working classes on a site in the south-west of the city. Of these 148 will be erected at once. The total cost, including roads, will be £86,000.

BATH.—The City Council has decided to proceed with the scheme for the erection of 148 houses on the Southdown site.

BILSTON.—The U.D.C. are to erect 36 non-parlour type houses in Newbolt Street, 22 in Thorne Street, 120 in Willenhall Road, 12 in Hill Street, Bradley, and 3 in Bridge Street, and are inviting tenders for the work. The architect for the scheme is Mr. W. G. Lofthouse, A.R.I.B.A., of Bilston.

BIRKENHEAD.—The Corporation building scheme for the erection of 553 houses at Bidston was recently approved by the Birkenhead Council.

BIRKENHEAD.—The Corporation have passed plans for the erection of a picture palace in Borough Road.

BLACKPOOL.—The Corporation are to erect 155 houses on various estates.

BOURNEMOUTH.—The T.C. recently approved sketch plans of a swimming bath and hot baths to be erected on the Northwood Estate, Winton, at a cost of about £35,000.

BURY.—The Housing Committee is to erect 24 houses at Deardens, Bolton Road, and 200 houses on the Clarence site off Hornby Street.

CAMELFORD.—The R.D.C. has decided to erect 30 houses in the following districts:—St. Breward, 8; Tintagel, 6; Boscastle, 2; Delabole, 8; near Camelford, 6. The estimated cost is £13,782.

CARLISLE.—The Corporation have decided to erect another 50 houses on the Longsowerby Housing Estate.

CHISWICK.—The Council proposes to build 24 houses for £10,908. The chapel at the former convent at Woodside is to become a branch library.

COLINTON.—At the Dean of Guild Court recently warrants were issued for the erection of 4 semi-detached villas in Thorburn Road.

COLNE.—The Corporation have prepared schemes for the erection of 160 houses on their two housing estates.

COVENTRY.—The General Committee of the Coventry and Warwickshire Hospital have decided to proceed with the erection of a new administration office block.

DOVER.—The London Road Church, Dover, has decided to extend the school property by the erection of a school hall. This, together with several new class-rooms, will cost £3,000.

DUMBARTONSHIRE.—The Education Authority is to erect a higher-grade school at Townhead, Kirkintilloch.

DUNFERMLINE.—Plans were passed at Dunfermline Dean of Guild Court recently in connection with a big extension scheme to Dunfermline and West Fife Hospital, which will entail an expenditure of between £46,000 and £50,000.

DUNOON.—Plans for the extension of the local cottage hospital have been passed by the Dunoon Dean of Guild Court. Estimated cost, £5,300.

EAST LOTHIAN.—The East Lothian Standing Joint Committee has approved the following expenditure for housing schemes: Twelve houses at East Linton, £4,864; 100 three-roomed houses in the western district at £390 each—£390,000.

ETON.—Plans passed by the R.D.C. —Proposed new factory at Farnham Royal, for Slough Estates, Ltd.; 16 houses in Meadfield Road, Langley, for Messrs. Perry, Ealing; 28 houses at Burnham, for Mr. J. E. Shuttleworth.

FULHAM.—The Guardians are considering plans for enlarging the nurses' home at their hospital.

HACKNEY.—The L.C.C. are to construct a new street and erect dwellings for 1,016 persons on the Well Street site, Hackney.

HALESOWN.—Plans for the erection of 43 houses by private enterprise were passed recently by the Halesown Council.

HESTON-ISLEWORTH.—Plans passed: Mr. T. Ferris, 14 houses, Burlington Road and New Road; Messrs. Parkwood Development Co., 10 houses, New Road, off Wood Lane; Mr. H. Langford Moyle, 17 lock-up garages and shop, Twickenham Road; Messrs. Perrys (Ealing), Ltd., 31 houses, The Crossway, Heston; Messrs. Home Counties Ideal Homes, Ltd., 16 houses, Wood Lane.

HODDESDON.—Herts E.C. have prepared plans for the erection of an elementary school in Burford Street, Hoddesdon, at an estimated cost of £14,000.

LEEDS.—The Corporation have asked Messrs. Braithwaite & Jackman, architects, to prepare plans for alterations at the wholesale meat market to provide a sheep slaughter-house and lairage.

LEEDS.—Messrs. G. F. Bowman & Sons, architects, have been asked to prepare plans for new offices for the weights and measures department of the Leeds Corporation in George Street.

LEEDS.—Messrs. Carby Hall & Son, architects for Sir Rowland Barran, are developing land on the Chapel Allerton Hall Estate.

LEEDS.—The Corporation Gas Committee have approved plans submitted by Mr. G. W. Atkinson, architect, for the erection of workshops and offices at the junction of New York Road and Bridge Street, at the estimated cost of £110,000.

LEEDS.—The City Council has decided to purchase two sites in Hunslet, for £11,800, for the erection of a garage.

LETCHEWORTH.—Herts E.C. are inviting the Letchworth Education authority to suggest an architect to design plans for the erection of a secondary school on a site in Spring Road.

LIVERPOOL.—Messrs. Gunton & Gunton, architects, Finsbury House, Blomfield Street, London, E.C.2, are to provide for scheme for the reconstruction of Messrs. G. H. Lee & Co.'s premises at Basnett Street, for Messrs. Selfridge's Provincial Stores, Ltd., 400 Oxford Street, London, W.1.

MANSFIELD.—The Corporation are acquiring properties in order to carry out improvements which were sanctioned last year, at a total cost of £250,000.

MANSFIELD.—The plans have been approved for the proposed enlargements to the Mansfield and District Hospital, prepared by Mr. B. C. Westwick, A.R.I.B.A., Rock Vale, 15 Bath Lane, Mansfield.

MELTON MOWBRAY.—The Leicestershire E.C. recently approved of plans for the erection of a senior boys' school at Melton Mowbray, at an estimated cost of £13,000.

MIDDLESBROUGH.—The Middlesbrough E.C. propose erecting a school clinic in Woodlands Road, at an estimated cost of £5,500.

NEWPORT.—The Whitehead Iron and Steel Co. have decided to erect a new institute, etc., at Newport.

NOTTINGHAM.—A cinema theatre is to be erected on the Mansfield Road near the Garden City Hotel.

PLYMOUTH.—At a cost of £13,782, Camelford R.D.C. has decided to build 30 houses, 8 at St. Breward, 6 at Tintagel, 2 at Boscastle, 8 at Delabole, and 6 near Camelford, the average cost being about £460.

PONTARDAWE.—Sixty houses are to be erected at the Tygwyn site, Clydach, for the R.D.C.

ROWLEY REGIS.—The U.D.C. decided to proceed with a scheme for the erection of 68 houses at High Harcourt, Old Hill, and to apply to the M.H. for approval. A recommendation by the Housing Committee for 24 non-parlour type houses, to be erected in two lots of 12 each on the Church Farm and Stile House Farm Estates, was adopted. The Council also agreed to a recommendation from the Housing Committee for the laying-out of

SOME TRADITIONS OF
THE PLASTERER'S CRAFT

*Drawn by D. M. Cafferata.
Historical data by George Eankart.*

IN 1488 Zarotto discovered the buried Baths of Titus, some parts of which were stuccoed. Raphael directed the making of a similar stucco plaster, and some of the stucco done with this plaster still exists.

In northern climates porous stucco is broken up by the action of frost, after rain. Waterproofed cement endures because it never becomes rain-soaked. A stone-like appearance that remains bright and unstained is obtained with ordinary Portland cement and

the Tivdale Hall Estate for housing purposes.

SANDERSTEAD.—The District Council have a site in view for a housing scheme. Messrs. R. Costain & Sons are to erect 48 houses in Foxearth Road.

SHARDLOW.—The M.H. have approved the extension of the Council's scheme for assisting private enterprise in the erection of houses for working classes to an additional 300 houses.

SHEFFIELD.—Subject to the houses being approved for purposes of grant under the Housing Acts, the following tenders are recommended for acceptance for the erection of houses on the Longley Estate (Scheme No. 3); S. Higton & Sons, 30 houses, £11,351 18s. 3d.; M. J. Gleeson, Ltd., 63 houses, £24,487 10s.; C. W. Alflat, 18 houses, £7,130.

SHEFFIELD.—The Housing Sub-Committee have agreed to pay to the Duchess of Norfolk £5,500, together with a sum to be agreed in respect of costs for the purchase of land adjoining the Longley Estate, and abutting on Southey Green Road, required for housing.

SHEFFIELD.—In connection with the proposal of the Sheffield E.C. to erect two schools by direct labour, it is proposed to appoint one works manager at a salary of £400, one quantity surveyor, £300, one accountant, £300, and two clerks, £250.

SHIREHAMPTON.—Work will shortly be begun on the demolition of some of the temporary dwellings on the Shirehampton housing site. The site is wanted in connection with the Housing Committee's scheme for the erection of permanent workmen's dwellings.

SOUTHAMPTON.—The Corporation are to erect 150 houses on various housing estates.

SOUTHAMPTON.—The Governors of St. Olave's and St. Saviour's Grammar School for Girls, Southampton, have in hand a scheme for the enlargement and improvement of the school, at a cost of £20,000.

SOUTHPORT.—Proposed alterations of Messrs. Broadbent's premises, Chapel Street, Southport, at a cost of £20,000. The plans have been prepared by Messrs. Parker & Crampton, East Bank Shore, Southport, and have passed the Corporation. The contract has not yet been placed.

SOUTHWICK.—The U.D.C. has decided to build 50 additional houses on their Marley Potts Estate.

SOUTHWICK.—The U.D.C. has decided to erect 50 houses on the Marley Potts Estate.

SPOFFORTH.—A new public hall is to be erected at Spofforth. Estimated cost: £2,800.

ST. ALBANS.—At the R.C. meeting it was provisionally decided to build a further 4 or 6 houses adjoining the present Council houses, at Frogmore, and the surveyor (Mr. H. F. Mence) was instructed to prepare plans.

STAFFORD.—It is proposed to erect a new Church of St. John. The architect is Sir Charles A. Nicholson, Bart., F.R.I.B.A., of London.

STAFFORD.—The T.C. are to erect 58 houses on the Tithe Barn Estate.

STALYBRIDGE.—The Corporation are

to erect 100 houses on the Harrison Estate.

STALYBRIDGE.—The Corporation have made a contract with Messrs. James Ridyard & Sons, Ltd., for the erection of a further 36 houses on the Hague Estate.

ST. HELENS.—The Corporation are to build another 48 houses on the Clock Face Housing Estate.

STOKE-ON-TRENT.—The Housing Committee are selecting sites for the scheme for the erection of 2,000 houses, and recommend the erection of 500 near Holden Hill, Burslem.

STOURBRIDGE.—The M.H. have approved the Council's scheme for the erection of 104 houses on The Grange Estate. The contractors are Housing, Ltd.

SWINTON.—Swinton & Pendlebury U.D.C. are to erect 180 houses in Folly Lane, Swinton.

TAMWORTH.—The B.G. have forwarded plans for the proposed extensions to the Infirmary to the M.H. Messrs. Marston & Linford, of Tamworth, are the architects.

THORNE.—At this mining township near Doncaster, parlour-type houses are to be built at a cost of £330, and non-parlour type at £298.

TORQUAY.—Plans have been prepared for the erection of a new Wesleyan Church at Union Street, Torquay, at an estimated cost of £25,000.

WARRINGTON.—The General Purposes Committee have accepted the sub-committee's recommendation of contracts for the erection of a further 100 houses on the Reynolds Street site and 130 on the Bewsey Estate.

WARSOP.—The Staveley Company have contracted for the erection of an additional 103 houses at Warsop, to be built by Structural Contractors, Ltd., London. This will bring the number of houses in the new village up to 477.

WEST LANCASHIRE.—At the monthly meeting of the West Lancashire R.D.C. a resolution was adopted in favour of a housing scheme comprising 90 workmen's houses. The 90 houses were allocated as follows: Aughton 10, Altcar 4, Bickerstaffe 4, Downholland 4, Lydiat 8, Maghull 4, Melling 12, North Meols 10, Halsall 4, Hesketh Bank 4, Rufford 6, Scarisbrick 4, Simonswood 2, Tarleton 12, and Bispham 2. Mr. Rosbotham was appointed architect and clerk of works.

WELWYN.—The R.D.C. have a scheme for the erection of another 100 houses in the Garden City.

WHELLEY.—St. Stephen's Church, Whelley, near Wigan, are proposing to erect a new building. The plans are being prepared by Messrs. Austin & Paley, architects, Castle Hill, Lancaster.

WOOLWICH.—The B.C. is to erect 53 houses at Eltham, at a cost of £30,647.

YORK.—The Corporation have made provision for the erection of 74 cottages on the Heworth re-housing site, and meanwhile tenders are to be obtained for the erection of 30.

YSTRADGYNLAIS.—The R.D.C. propose to erect 18 parlour type houses at Abercraive in connection with their housing scheme.

The College of Estate Management

At the College of Estate Management, recently, Mr. Sydney A. Smith, F.S.I., delivered a lecture on "The Valuation of Shops."

In the course of his remarks, Mr. Smith said value existed because traders wanted premises in which to show and sell their goods, and so demand was created. Mostly traders preferred to pay rent rather than buy the freehold. The factors which influenced rent were chiefly position and the suitability of the premises for the purpose. The most valuable shops were those which appealed to chance customers, especially in localities where people congregated or loitered, such as the station entrance or an arcade frequented in the luncheon hour. Restaurants and other businesses needed positions where they could not only be discovered by the passer-by, but would be remembered as being in that locality by those who wanted them. In considering shop values a great deal of attention must be given to the multiple traders whose names were household words in this country. Multiple traders had entered into the market for shops, and competed for the best positions. In some towns the advent of such a shop had the effect of shifting the established marketing centre. Another point to bear in mind when valuing was that in many streets one side was better than the other. The north side was supposed to be the better side of Oxford Street, the reason given being that in afternoons, when ladies went shopping, it was the sunny side. The south side of the Strand was the better side because Charing Cross Station delivered on that side, and on that side also a large traffic went to Waterloo Bridge. A good shopping area required to have shops on both sides of the street, but the street should not be too wide, nor the pavements too narrow so as to discourage loitering. Blank spaces in a line of shops, caused for instance, by a church, were apt to stop and turn back the foot traffic. Care had to be taken, also, that the shops were near a principal stopping-place of trams and buses, and that these means of transit did not carry the public away to a more important shopping centre a little further on. In large provincial towns the values for shops in the principal streets were about equal to the best suburban values in London. Upper floors were often a nuisance, the trader did not want to live in them, nor to have the bother of sub-letting. Basements also were usually disliked, but a back or side entrance was often desirable.

Change of Name

As from January 24, 1927, the name of Messrs. Ackroyd & Best, Ltd., has been changed to Hailwood & Ackroyd, Ltd. Mr. Hailwood continues as managing director of the company, and the staff remain the same.

HY-RIB

The combined reinforcement and centering

HY-RIB IS THE PERFECT BASE FOR PLASTER AND CONCRETE

Note the design of the mesh as a key for cement plaster

The whole of the suspended ceilings in the re-building scheme of MESSRS. BOURNE & HOLLINGSWORTH, LTD., are being constructed with Hy-Rib. False beams, cornices, and screens for the fireproof doors in Hy-Rib construction are also included in the scheme. Special concrete slab ceilings, forming an important part of the ventilating system, have been reinforced and centred with Hy-Rib, so that hardly any timber falsework was necessary.

HY-RIB FOR SUSPENDED CEILINGS

Hy-Rib as used in ceilings largely dispenses with the small channels, T's, angles, and studs necessary where the ordinary type of lath is used, because the ribs of Hy-Rib give the necessary stiffness and rigidity. In this way the great expense of wiring lath to a large number of separate channels is much reduced.

Hy-Rib is placed with the lath surface downwards, providing a perfect key for plastering, and does not require more than a minimum amount of material.

Hy-Rib can be used in the construction of both flat and curved ceilings. In case of the latter, the curving being done at our works eliminates expensive labour on the site.

Hy-Rib sheets are supported at about 4 or 5 ft. centres either directly from the construction above or by means of lines of flats, ceiling joists, channels, or T's.

Hy-Rib for ceilings saves time and labour in installation, and its initial cost is lower than would be the case if ordinary metal laths were used. Those builders who have experienced the difficulties of erecting ordinary lath and of straightening it out will best appreciate the advantages of Hy-Rib, which is delivered in rigid sheets.

MESSRS. BOURNE & HOLLINGSWORTH'S RE-BUILDING SCHEME, OXFORD STREET, W.
Architects: SLATER & MOBERLY, F.F.R.I.B.A. Contractors: F. G. MINTER, LTD.

The new building will contain 27,000 square feet of HY-RIB.

*The 1927 edition of the
Hy-Rib Handbook will be
forwarded on application*

The Council Offices, Pallant House, Chichester.

WINCHESTER.—February 14.—For the erection of 42 brick or concrete cottages at St. Giles' Hill, Winchester. Mr. Thomas Holt, Guildhall, Winchester. Deposit £2 2s.

Medusa Waterproofing Compound

- ☞ Medusa Waterproofing Compound is a mixture supplied for incorporating with Cement in cases where it is desirable that the Concrete should be absolutely impervious to water.
- ☞ Concrete can be made resistant to water by careful mixing, tamping and manipulation, but even the best that can be produced contains interstices between the components, known as voids, which may amount to even 30 per cent. of the mass according to the care expended in its handling. In any case the human element may always fail to provide the factor of safety which is desired. Such open spaces or pores exert capillary attraction in the same way, but of course not so obviously, as is demonstrated by dipping a sponge or piece of blotting paper into water, and it is against this force that Medusa Waterproofing reacts.

Write for the Medusa Catalogue.

G. & T. EARLE (1925) LTD.
Hull

Building Tenders Accepted

ASHFORD.—For the erection of the proposed County School for Girls at Ashford: S. Vant & Son, Folkestone, £29,503 3s.; Perry Bros., Ealing, £28,825; Hayward & Paramor, Ltd., Folkestone, £27,977; Whiting Bros., Ospringe, Faversham, £27,650; John F. May, Broadstairs, £27,493; G. E. COPPER CYLINDERS

Patent No. 140,184

Please specify **"NATIONAL"**
(Registered Name).

Every genuine "National" Cylinder is stamped with the name as shown on block.

Sole
Maker: **THOMAS FILDES,**
Thornton Street Works, MANCHESTER.
(Established 1819)

THE "NATIONAL"

embodies a degree of quality and value unprecedented in the history of copper cylinder manufacture, its price being very little more than that of the flimsiest types.

By specifying the "National" you eliminate risks of failure.

You ensure a reliable article of standardised and uniform quality.

Many thousands of "Nationals" are in use on Housing Schemes, and can be had through all Builders' Merchants or Plumbers.

“Beauty begins where the light comes in.”

Specify PLATE GLASS for Windows

You are then certain that the Glazing of the house will be in accordance with the rest of your architectural plan, in keeping with the degree of richness, dignity, beauty and desirability you have in mind.

Plate Glass, as the pre-eminent glazing, is being advertised to the public, who are learning to appreciate the value of Plate Glass for the windows of their houses.

Plate Glass is a non-conductor of heat, it is practically sound proof, and less liable to breakage. Its brilliant, polished surface enhances the exterior of a house, and from the interior it gives perfect vision. There are no ugly “wavy” lines or distortion; no detracting from the beauty that comes in — through the window.

“Plate Glass and the Home” is the title of a brochure being widely distributed among the public. A copy will be sent you free and post free on request. Write

Park Lane Hotel

We regret that in our issue of February 4 we omitted to mention in the list of sub-contractors that Messrs. H. H. Martyn & Co., Ltd., carried out the French stucco and fibrous plaster work in both Piccadilly and Brick Street entrance halls, and also in the lounge, of this hotel.

The Lead Paint Act

In a recent communication to the Press, H.M. Inspector of Factories, Wolverhampton, directs attention to some provisions of the new Act of Parliament, namely, "The Lead Paint (Protection Against Poisoning) Act, 1926," which is important to anyone employing any person in painting buildings whether lead paints are used or not. From the 1st inst. there is an obligation on each employer referred to above to: (1) Send to the factory inspector of the district in which his office is situated a notice of his name and address; (2) keep at his office a register of the persons employed in painting buildings and the work on which they are employed. This register (Form 92) can be obtained locally, or H.M. Stationery Office, Kingsway, London, W.C.2; (3) to report to the factory inspector and the certifying surgeon any case of lead poisoning which occurs among his employees.

Scottish Building Wages

Under the recent agreement with the Scottish Contractors' Association, bricklayers in the West of Scotland will receive an advance of one half-

penny an hour. A similar increase will be given on September 1, making the minimum then 1s. 9d. an hour.

Incorporated Church Building Society

At a recent meeting of the Incorporated Church Building Society among grants made towards building new churches were: Bitterne Park, The Ascension, £500; Hapton, S. Margaret, £150; Blackpool, S. Stephen, £400; Rishworth, S. John-the-Divine, £150; Wigan, S. Stephen, £250.

Trade Notes

The Rawlplug Co., Ltd.

As a result of the damage caused by the recent storm in Scotland, the branch offices of the Rawlplug Co., Ltd., situated at 19 Wilson Street, Glasgow, were entirely destroyed. Arrangements have, therefore, been made for all Scottish business to be transacted through the Head Office of the Rawlplug Co., Ltd., at Rawlplug House, Cromwell Road, S.W.7.

New Companies

MAYBURY & CO., LTD., (218,134) Private company. Registered December 11. Capital £15,000 in £1 shares. Object: To acquire the business as formerly carried on by J. Ward the business carried on by him at Baggots Bridge Brickworks, Moxley, Darlaston, and to carry the business of brick and tile manufacturers, &c. Solicitors: Hall, Pritchard, Lichfield Street, Bilston.

Giving instructions

Draughtsman : The roof question of course is already decided upon ?

Architect : Yes ! "Vulcanite."

Draughtsman : Good. I suppose its economical and other good points is the reason why so many big roofing jobs are done with "Vulcanite."

Architect : That is so, but that is not the only explanation. From my 28 years' experience, "Vulcanite" is satisfactory in *every* way. Remember that it is impervious to all weather and is laid to resist fire. Then again, it's so durable and has such great flexibility.

Draughtsman : No wonder Architects recommend "Vulcanite" . . .

"VULCANITE" roofing is used under the London Building Act and the Bye-laws, etc., of all Borough and Urban District Councils; and is accepted by all the leading Fire Insurance Companies as an Insurance Tariff Roof

We shall be pleased to have your request for our Illustrated Booklet, and to supply detailed drawings and estimates free.

DULCE EST DESIPERE IN LOCO!

It was, perhaps, too much to hope that the architects' Registration Bill would come before the Commons without a dissonant voice from the Profession—or the Art. We are told, however, that the prominent member of the younger school is to bombard Parliament and his Confreres with pamphlet opposition, and, having a facile pen, he may be expected to cloak defects of argument with literary polish. Professor E. S. Prior, however, is actually the first to enter the lists, consistent in opposition as when, thirty-five years ago he helped to compile "ARCHITECTURE: A PROFESSION OR AN ART." That lance, however, is too blunted and too archaic for the present sortie; and the Professor advances a much more subtle *argumentum ad minem* to catch the man in the street, but one which seems to have about as much to do with the registration Bill as the binomial theorem.

Let us come to grips with this question. No one wants Registration, *per se*. No sensible person believes that it will achieve miracles. No sensible person believes that it will create great architects, or prevent them from coming into existence. The most that it can accomplish is to ensure that the future votaries of architecture shall know something about that art; and that their training, in work of ever-increasing complexity, has, at least, been as thorough as that required for an engineer, a doctor, an accountant, a lawyer, or any other professional man who proffers his knowledge or skill to the public in exchange for money. Could we be assured that all future entrants to the architectural profession were budding Professor Priors, few people could be found to worry about registration.

But the brutal fact is that while Professor Prior and his coadjutors of thirty-five years ago were discussing Architecture on the Olympian heights, the Profession or the Art—which you will—was being swamped by thousands of unfitted and untrained men, who, after knocking about an office for a year or two, took a crammer's course, passed examinations and became fully-fledged members of the aforesaid art or profession, for which they had neither aptitude nor ability, but which they set out to bamboozle the public into believing they possessed. The very achievement for which the Professor pays tribute to the Royal Institute—"safeguarding the respectability of the profession"—led, under existing conditions, to the undoing of architecture. Had "architect" been a synonym for

"bohemian" or "scallywag", the respectable fraternity would have passed by, and only those impelled by temperament or inward urge would have become votaries of the Mistress Art, to her gain if to the loss of respectability. As things were shaping, while the bulk of the architecture before 1790 was a precious and graceful thing, in 1890 we had reached a point in this country when the buildings worth a second glance might be put at 1 of one per cent. of those erected.

We are not arguing against respectability. No Society under a Royal Charter can disdain that virtue, nor conduct its affairs except with dignity and decorum. The painter or sculptor may be as bohemian as you like; your respectable public buys his work through a dealer or from a gallery and is under no compulsion to meet him. Personal relations between an architect and his client, however, are inevitable: the architect may need to meet his client's wife or family; he may have to act in close touch with highly-respectable committees; he acts, too, in a fiduciary position. But this only makes it all the more necessary for the Royal Institute to ensure that the call to the rank of architect is not the desire for a polite occupation but the urge of a compelling talent. And we see no other way of doing this, saving by precluding the title of architect from all save those who, by their training and abilities, have demonstrated their right to use it.

The Registration Bill deprives the public of no practical privilege that it at present possesses. The young man of family or influential connections will still be able to design buildings for them without the necessity of thorough training. The man in the street can still employ the jerry-builder to design his dwelling, or, imitating the fool of the legal profession, design it himself—if the local by-laws permit. The one thing that will be denied to him is, and should be, the title of architect.

The gravamen of Professor Prior's protest is based on a letter in his possession. We might venture a guess at the name of the "late P.R.I.B.A." who signed it, but we take leave to doubt whether the signatory is, or ever was able to bully his clients as alleged, or as Professor Prior suggests Registration will enable all architects to do. What this particular architect's attitude to his clients, however, has to do with the Registration Bill is beyond us. We wish Professor Prior would explain the joke.

Notes and Comments

Rural England

The C.P.R.E. (the Council for the Preservation of Rural England rather favours the abbreviation, we believe) has made a public appeal for annual subscribers, signed by the Earl of Crawford and Balcarres, the President, Mr. E. Guy Dawber, Vice-President, and Professor Patrick Abercrombie, the Hon. Secretary. They estimate that an income of at least £1,000 per annum is required in view of the important work they are anxious to undertake. The constituent societies are subscribing towards their means, and individual members of the public are asked to assist in the work. Minimum annual subscriptions of £1 1s., or donations to any amount, are invited. The Council's principal expenses will naturally be in the direction of staff, offices and postage to deal with a large correspondence, and with expenses incurred in forming and keeping in touch with the local committees, who will constitute the Council's watchers in the rural districts. Subscriptions or donations will be gratefully received by Mr. H. G. Griffin, the Council's Assistant Hon. Secretary, at their offices, 33 Bloomsbury Square, London, W.C.1.

River Pollution

A deputation from the Joint Committee of the British Waterworks Association, which was received by Lord Balfour this week, requested the Government to give urgent attention to the pollution of rivers, and suggested the setting-up of a co-ordinating authority under one of the existing departments, preferably the Privy Council, to deal with the matter. On this the Ministries of Health and Agriculture, the rivers boards, navigation and fishery boards and local authorities would be represented. Originally this question of pollution mainly excited the owners of fishing rights; but the increased fouling of streams by factory wastes and sewage effluents is becoming a grave matter as affecting not only agricultural crops and cattle, but the sources of water supply for many towns and villages. Research into methods of dealing with pollution cheaply, and without undue interference with industry, are thought to be necessary. The destruction of bird and fish life, although regarded as rather negligible matters when put in the balance against the necessities of industry, have often far-reaching consequences. They entail a disturbance of the balance of nature from which agriculturists have often to suffer through the prevalence of some pest no longer kept in check by its natural enemies.

The Brainworker and Privilege

The recent meeting of the British Confederation of Arts was remarkable for the claim put forward for special privileges on the part of the native art worker. The notion has its inception in the very substantial practical gains obtained by the French branch of the International Society for the Protection of the Artist and Brainworker, of which, we gather, the British Confederation is an affiliated body. One of the visible results of the French body is a reduction in the tax on paper; another a standard form of contract imposed upon and accepted by all the French publishers. The municipal authorities of Paris are to build blocks of flats on the site of the old fortifications, some of which are to be specially reserved for brainworkers, and some, with studios, are to be erected for artists. How far claims by the British "intellectuals" for special privileges will be met by the body politic here remains to be seen. At present privilege, in many directions, seems to be the prerogative of the "worker," by which, of course, the "manual" worker is meant. We doubt, however, whether any

category of workers should be favoured above their fellows; and a grant to one class would, inevitably, be followed by irresistible demands from others.

Spencer House

Some time has elapsed since we chronicled the impending conversion of Spencer House, St. James's into a ladies' club; but next month the Ladies' Army and Navy Club moves into the town house of Earl Spencer. It is well that these mansions of a past day, when entertaining was practised on a scale that no longer consorts with modern ideas or purses, can be turned to a useful purpose, and one, moreover, that still preserves their architectural treasures. The large reception rooms which they possess need no alteration for their future use as club-rooms. Only in the upper storeys, which, as a rule, were not specially decorated, is some alteration needed, as at Spencer House, to provide the large number of bedrooms and bathrooms which a modern club must contain. The proposed "glassing-in" of the terrace facing the Green Park, to provide a sort of Palm Court tea-room, would be, however, a regrettable addition, reminiscent of the commercial hotel, against which we must register a protest. However great an asset it may appear to the club, it must inevitably ruin Vardy's classic façade.

London Lungs

It is a hopeful sign that Mr. Hunt's paper on the London Squares, reported in our last issue, has brought a widespread endorsement of his view that they must be preserved as open spaces. Mr. Harold Swann, writing to *The Times* from the County Hall, states that one of the first results of Mr. Hunt's paper has been the resolve of one owner, possessing squares in the West End of London, to agree to their being preserved unbuilt upon for all time, under the provisions of the Act of 1906. In regard to the Foundling Estate squares, a development has been the addition of the Chelsea Borough Council to the list of opposers of the Covent Garden Market Bill. A letter of protest also from the nineteen doctors resident on the estate has been sent to the Minister of Health. In addition to the seven public authorities opposing this Bill, there are the two Garden Square Committees, the Covent Garden Tenants' Association and others, the British Florists' Federation, the Retail Fruiterers' and Florists' Association, the London and Provincial Fruit Buyers' Association, and the National Farmers' Union.

Windows

A leader writer in *The Times* has lately fallen to musing on the subject of windows, and does not disguise his preference for the sash variety. It is a good many years now since the country cottage craze raised something of a controversy over the respective merits of the sash and the casement, and a long, low window for low rooms led many architects and their clients to favour the claims of the casement over those of its Queen Anne rival. Our *Times* leader writer opines "that lattice windows, with leaded panes, may look sweetly rural"; but he finds that they are a fruitful source of draughts, admitting the outer air directly into the body of the room, instead of, as with the sash window, admitting it discreetly at an upper level. "Doubtless we must endure something if we are determined to live æsthetically, and to certain rarefied spirits a casement window overhung by eglantine is cheaply bought at the price of occasional influenza." Whether the assertion in this leader that the casement "has fallen a good deal out of favour" is accurate, we should hesitate to support.

IMPERIAL DELHI, SECRETARIATS: DETAIL OF VAULTING, SOUTH CENTRE BLOCK AND COURTYARD

SIR HERBERT BAKER, A.R.A., *Architect*

SIR HERBERT BAKER, A.R.A.

On Monday last, the Council of the R.I.B.A. nominated Sir Herbert Baker, A.R.A., for election for the Gold Medal for Architecture for this year.

Born in 1862, Sir Herbert was educated at Tonbridge: there it was apparent that he was in many ways conspicuous among his fellows, and the qualities which make a man Captain of his XI, however much some may dispute it, were undoubtedly necessary to produce a mind capable of excelling in a game even more difficult to play than cricket. He was trained in that happy combination of school and office, served his articles in the normal way with Mr. Arthur Baker, and attended the Royal Academy Schools, when, as a student in 1889, he won the Ashpitel Prize, a prize awarded to the most distinguished student in the final examinations of the R.I.B.A.

As "one of Ernest George's young men," he received that same sound training in the essentials of architecture which characterised that office, from which so many prominent architects have emanated. Here, too, he evidently acquired that habit which was to continue with him through life and to stand him in such good stead, the habit of careful measuring and understanding sketching. It is from such a scholarly monograph as his survey of the Old Conway Palace of Plas Mawr and his sketch-books crammed with delightful studies of English and Continental detail that we are able to recognise that rare admixture of the antiquarian and the artist, without which no truly great architecture can be. Flamboyant exuberance, after all, seldom produces but the architecture of the exhibition, just as too much patient research and scholarship is bound to have a deadening and devitalising influence on the work produced. It is, when we remember these

things, that we try to imagine a mentality halfway between a Vanbrugh and a Chambers: architecture which can show the boldness and life of Castle Howard with the grace and scholarship (which even borders on pedantry) of Somerset House. It was with such a mentality as this that Herbert Baker was equipped when, in 1892, he set out for South Africa, a land developed at that time only to the extent of a mining camp, but a land of infinite promise, although architecture so far was represented only by the tin-shack. Here this brilliant young architect and idealist, who never allowed his visions to interfere with his practical common sense, was hailed by Cecil Rhodes as a kindred spirit. For Rhodes, too, was an idealist and, with all his vast dreams of Empire, longed for an architecture worthy of the country which to him was as his heart's blood. And he knew, moreover, that he had found someone who could give it. And so it was that Herbert Baker was to design and build so much in South Africa, where, in all his work, he recreated a national style, a style distinctive

of the buildings of the early Dutch settlers of the seventeenth century, and succeeded here, as later he was so to do in India, in infusing national characteristics and feeling into every building he designed, such as no man had done before or since. Of his bigger buildings, the best known to his own countrymen are the Union Buildings, Government House, Railway Station and the Cathedral at Pretoria, the Cathedral, Salisbury, Rhodesia, the Cathedral at Cape Town (with Mr. Masey), and the South African Institute of Medical Research and the Union Club at Johannesburg (with Mr. H. L. F. Fleming), and all the time he was busy with villages and farmhouses, churches, and homes for coloured labourers and mineworkers, busy until and for many years after the saddest building he ever worked upon for his patron and friend. This, the Rhodes Memorial, on Table Mountain, he placed on the spot which had for

so long been Rhodes' home retreat. A bust of this great Empire builder is enshrined in a little temple overlooking the wide horizon. Four great bronze lions guard the steps leading to the summit, where Watts' magnificent statue, Physical Energy, stands strangely emblematic of the immense vitality of the man in whose honour the structure is built.

Sir Herbert Baker had been for more than twenty years in South Africa, when it was decided to construct a New Delhi as the future capital of India. In this project he was to collaborate with Sir Edwin Lutyens, and this vast proposal might have intimidated many an architect of Baker's age at the time, wholly unfamiliar with the country and its building conditions. But to an enthusiastic idealist who had left his mark on a continent from the Cape to the Zambesi the idea, naturally enough, appealed. And so, at the age of fifty,

he embarked with an old friend and an artist of universal appreciation upon one of the greatest building achievements of the age, and to Sir Herbert fell the Secretariat and the Legislative Building, immense buildings designed to house all the administrative departments of the Government of India. In England he has been responsible for many fine commemorative buildings, the beautiful Kent County War Memorial at Canterbury, the War Memorials of Harrow and Winchester, and, incidentally, a charming memorial to W. G. Grace at Lords. Sir Herbert is at present, among other works, engaged upon the reconstruction of the Bank of England, one of the most difficult and most interesting rebuilding schemes ever undertaken.

Sir Herbert was elected an Associate of the R.I.B.A. in 1890, a Fellow in 1900. In 1922 he was elected an Associate of the Royal Academy, and in 1926 he received a knighthood for his service to art. The award of the Gold Medal is the crowning recognition of an amazing career, which will, we trust, see no diminution of its rich creative impulse for many years to come.

SIR HERBERT BAKER, A.R.A.

THE POLICE HEADQUARTERS AT COPENHAGEN

By HOWARD ROBERTSON. Photographs by F. R. YERBURY.

It would be difficult to find any building, old or new, which contains a more striking combination of qualities and defects, of agreeable surprises and sorrowful disappointments, than the building for the Police Headquarters in Copenhagen.

The whole scheme and character of the plan form, which, of course, dominates the articulation and armature of the building throughout its several storeys, appears in itself to be an anomaly. Its luxury of shape, the great circular courtyard, the rotundas in which are formed the corridor junctions and the secondary staircases, the great open colonnaded atrium which provides a histrionic climax to the courtyard, all these things suggest some great Italian Palazzo rather than the headquarters of a citizen force which has no especial claims towards being housed in so spectacular a fashion. While the inspiration of the plan and the main feature of the circular courtyard is fairly obvious, that in itself would offer no handle to criticism; but after a visit to the building, it seems almost impossible not to credit the rumour that it has been wasteful in planning, in first cost of construction, and in subse-

quent upkeep. And the reproach of wastefulness implies inconvenience of working.

No less amazing than the adoption of a scheme of this type, involving features of grandiloquent uselessness, is the actual relationship of character between the several parts of the building, though it is only fair to explain at this stage that Professor Hack Kampmann, under whose guidance the building was planned, died in 1920, and the work was subsequently completed by the architects Aage Rafn, Holger Jacobsen, and H. J. Kampmann. The taking over of an unfinished building of this magnitude would almost inevitably affect its character, but even so it is difficult to reconcile the various moods and manners of which the design and details seem to have felt the successive influences.

The exterior of the building is uncompromising and rather dull, having proportions which are clumsy without being impressive. The tone is that of the drab stucco, which is unrelieved by any real colour, and it is only on the front elevation that a hint of cheerfulness is given by two rather sprightly reminiscences of an instrument of crime transformed into finials

to the window grilles which flank the arches. There is, however, character in these façades, a hint of law and order, and, in the big wall surfaces and blank looking windows, an expression which is appropriately forbidding. But what shall the visitor say when, after passing through a vestibule which is worthy of any modern Danish building of refinement, he emerges through a not too generous opening into the great courtyard,

paved all in stone and presenting the emotional spectacle of an essay in the most "full-blown" grand manner, yet ruined by the most elementary blunders in proportion. The colour of the stone, the play of light and shadow, the uninterrupted sweep of the great circle are all present to help in the achievement of an effect of generous magnificence, but the equalities of the horizontal divisions, the repetition of similar cornices at different heights, the combination

of weakness and clumsiness in the fenestration and the balustrading, are defects which are hard to forgive when they occur on such a scale.

The most interesting feature of the plan is not this courtyard, in spite of its ample size, but rather the pillared atrium with its open stone ceiling, in which is framed a brilliant rectangle of sky. The great walls of plain masonry, the Corinthian columns soaring to a height of at least 40 feet, make this atrium into a space of awe and grandeur. It is a piece of architecture revealing an intense appreciation of the dramatic.

The access to this space is small, perhaps wilfully reduced in order to increase the sense of scale, but from the bigger standpoint of the conception of the building plan as a whole it is really insufficient. A similar charge of insignificance can be levelled against the two doors which connect the atrium with the back block of the building, for they are not only small, but rather hard to find. Perhaps, again, there is purpose behind this planning, but the purpose does

not excuse the inconsistency of meagre communications between spaces of noble amplitude.

So much for major criticisms; and now one may say that these would not be so harsh were it not that the design, both in the mass and in detail, contains so much of merit that one is all the more inclined to cavil at mistakes.

In the first place, the building as a whole is a work of architectural distinction. It is important in size, which means very little, but it is also important in character. It contains much that is typical of the best modern Danish movement towards a revival of a pure classic spirit. There is not, either in the conception or its working out, a single hint of vulgar or commonplace thought. There is, on the contrary, a fine feeling for refinement and selection in the expression of civic character which has been imparted to all those sections of the building to which the public normally has access. And, in addition, the building has humanity in detail, for there is gaiety in the bright greens and blues and reds with which

POLICE HEADQUARTERS AT COPENHAGEN: THE ATRIUM

The late PROF. HACK KAMPMANN, and AAGE RAHN, HOLGER JACOBSEN and H. J. KAMPMANN, Architects.

the corridors are painted, and there is evidence of subtle enjoyment such as, for example, the bronze furniture of the Police Conference Room. This latter room is used for periodic conferences of the various police chiefs. It has a grey marble floor and walls of a chocolate-coloured stucco, with the two columns flanking the end recess in yellow—a not too happy combination. The bronze seats are upholstered in a string-coloured material.

There is freshness in this detail work. The visitor cannot but enjoy its excellence in design and material, but the taxpayer might legitimately grumble at the obvious expenditure of time and money involved in the more utilitarian services of the building, such as the cloakrooms and lavatories. They are well designed, but one can almost hear the chuckle of the draughtsman as he elaborated their expensive little subtleties.

The lantern lights to the circular staircases, the bronze lighting fixtures, the grilles to the radiators (which in many cases are set in the deep jambs of the windows), and the design of the interiors

generally, are the points which most strongly impress. In nearly every case there is that feeling, which is typical of the best modern Danish work, that nothing is drawn, still less executed, which is not subjected to a rigorous selective scrutiny. The resulting distinction, and the atmosphere of restraint, do not, however, preclude a spirit of freshness, and even joy.

This Police Headquarters building offers, as we have said, strong contrasts. On the one hand is a plan which is a determined, but nevertheless somewhat weary, effort in the grand manner, and a façade which is clumsily appropriate. On the other, is a fresh young modern spirit, enjoying freedom within the limits which the building gives, and expressing itself in detail with a lightness of touch which shows that the interpretation in architecture of the majesty of law is all the better for a little of the Gilbertian spirit. One cannot but feel that in interpreting the programme of the Police Headquarters the joke has been a little bit on the Police, and much more on the Public. But the result is a building which alone is worth a visit to Copenhagen.

POLICE HEADQUARTERS, COPENHAGEN: THE COURT ROOM

Notes in Brief

Wythenshaw Park, Manchester's new pleasure ground, is to be opened next month. The park, which was a gift to the city by Mr. and Mrs. E. D. Simon, and which includes the mansion and old-world garden, is, on the advice of the Manchester Parks Superintendent, to be preserved very much as it is.

At a meeting of representatives of local authorities in South-East Sussex, including Hastings, Bexhill, Rye, Battle, Rye and Ticehurst, the formation of a joint regional planning conference was decided upon. Mr. G. L. Pepler represented the Ministry of Health, and Mr. Thomas Adams attended as town-planning adviser to the County Borough of Hastings.

The latest pronouncement about Harrington House, the old mansion in Craig's Court, Charing Cross, London, asserts that it is hoped to preserve the façade and the staircase as part of the new telephone exchange building which the Government is about to erect on the site.

The Committee of the Willett Memorial announce that they have now secured 71 acres of Petts Wood, Chislehurst, for dedication to public enjoyment as a memorial to the late William Willett. They still hope to secure further donations towards a further sum of £4,000 required to secure the remaining 16 acres of frontage land. The wood is being conveyed to the National Trust, and the opening, this spring, is to take place with the advent of summer time.

The War Memorial on the Mount of Olives, which takes the form of a chapel in the War Cemetery at Jerusalem, will be unveiled by F.M. Lord Allenby on May 7 next. The architect is Sir John Burnet,

R.A., the mosaic work has been designed by Dr. R. Anning Bell, R.A., and the sculpture is by Mr. Gilbert Bayes, F.R.B.S.

Sir Oswald Stoll, at the recent Brighton Licensing Sessions, obtained a renewal of the provisional licence for a proposed theatre and restaurant in West Street. He stated that the delay in proceeding with the erection of the building was due to inability to get possession of the site which had been bought, and to the great rise in the cost of building materials, about 1s. per cubic foot, since the scheme was started. He believed that he would get his chance to proceed in 1928, when the housing subsidy was likely to come to an end.

A strike of building labourers at Glasgow is probable on March 1, the Scottish Contractors' Association having notified a reduction of 1½d. per hour, bringing the rate down to 1s. 1½d. from that date. Negotiations between the respective parties have so far broken down.

The provision of efficient footpaths on existing main roads is a policy confirmed by the Surrey County Council on a recommendation by the Abinger Parish Council. Pedestrians in rural districts incur grave danger in walking along roads where no footpath exists, especially at night. Footpaths are generally included in schemes for new main roads, but the existing main roads, especially those running between high banks, are in great need of this safeguard for the pedestrian traffic.

The Housing Committee of the London County Council has decided to prohibit the keeping of dogs and cats by new tenants in the Council's tenement dwellings. The rule, in the case of existing tenants, is "to be enforced with discretion."

New Ways and Means

*The Editor will welcome early information of
New Plant, Materials and Fittings*

The New "Winget" Open Drum Mixer.
(Winget, Ltd.)

A New Concrete Mixer

Three new models in concrete mixers of the open drum type have just been placed on the market by Messrs. Winget Limited, of Winget House, Grosvenor Gardens, London, S.W.1. These mixers, which we illustrate, are provided with a special form of drum—known as the "Burn-Lancaster" Drum—in which a semi-helix at the bottom combines with the centre-pin, and the top blades of the drum itself, to produce a continuous churning action which is *actually* mixing the charge whilst the machine is working. By this means, no matter how long mixing is allowed to continue, separation of the materials cannot possibly take place, as in open drums of the ordinary type, where the large aggregate may be brought to the top and the small aggregate is sent to the bottom. The 5½-4 cu. ft. model, shown in our first illustration, can be supplied with or without elevating hopper; a smaller machine of similar design, 3½-2½ cu. ft. batch capacity, is also made. In the former machine the drum measures 30 inches diameter x 31½ inches deep, the opening being 18 inches. The drum shaft is fitted with a bottom ball thrust washer, and is grooved and recessed for lubrication, whilst the drum opening is reinforced with a steel rod over which the edge is beaded. The frame-work of the machine is constructed of steel channels and angles, mounted on two steel road wheels of 3½-in. face,

and fitted with a drawbar which can be pushed back into the frame when the mixer is working. The drum is evenly balanced, and can be thrown over into any position by operating the tilting wheel, a positive locking device being fitted, so that the drum can be loaded or discharged on either side as desired. This 5½-4 cu. ft. model is driven by a 2½ h.p. Lister hopper cooled petrol engine, totally enclosed in an all-steel housing, and giving a drum speed of 17 r.p.m. The 7-5 cu. ft. machine, shown in our second illustration, has an average daily output of 60-70 cubic yards, according to the consistency of the mix. In this unit the hopper can be elevated by power without oscillation, the pivot being designed to remove all strain from the machine when the hopper is being raised. The high angle obtainable at charging point is also a feature which provides for a clean and quick discharge. Power is

The Burn-Lancaster Mixing Drum Bottom.
(Winget, Ltd.)

supplied by means of a 5 h.p. Lister petrol engine, which, as in the other models, is totally enclosed in an all-steel housing, and gives the same uniform drum speed of 17 r.p.m.

Petrol Gas on a Small Scale

A small electrically driven petrol gas plant, providing sufficient gas for an ordinary sized cooker or two or three gas fires, has just been placed on the market by Messrs. The Aerogen Co., Ltd., of 36 Bolsover Street, Great Portland Street, London, W.1. In this plant the electric motor is no larger than that of a vacuum cleaner, and consumes from one to two units per week, or an amount of current equal to that taken by an ordinary 50-watt lighting bulb. This motor drives a small air fan, which forces air under pressure to a chamber where it is carburetted with petrol vapour, an ingenious device being employed to control the supply of air and vapour in the necessary proportions to give a gaseous mixture suitable for heating purposes. The production of gas is discontinued the moment all gas taps are turned off, even if the motor is accidentally left running. The complete unit, which we illustrate, is

The New "Aerogen" Petrol Gas Plant.
(The Aerogen Co., Ltd.)

especially adapted for small country houses already equipped with electric light but lacking a supply of gas. It is 18 inches in diameter x 20 inches in height, the petrol tank having a capacity of 2½ gallons, and can be placed in any convenient outhouse or wall box cupboard where only an ordinary electric plug point need be provided. The housing of the plant should, however, be as close as possible to the appliances served by the gas, and the wiring and switch should be so arranged that the motor can be controlled from some point within easy reach. "Aerogen" gas, as made by this plant, is a uniform mixture of air and petrol vapour, the latter being in a pre-determined proportion of from 3 to 5 per cent., according to the quality of the gas required.

A Portable Rough-casting Machine

Messrs. R. C. Birtley, of 121 Salters Road, Gosforth, Newcastle-on-Tyne, have sent us particulars of a new Plastering and Rough-Casting Machine which has just been placed on the market. This machine is entirely self-contained, and is driven by means of a small petrol engine, which supplies power to the mixing gear air compressor and spraying pump. The mixing of the cement and sand is carried out in a cylindrical tank provided with rotating blades, water being drawn from a storage tank from which it is forced by the action of the pump through a length of flexible armoured hose and spread over the surface of the walls. Fine gravel for the rough-cast finish is supplied from the storage hopper, from which it is blown on to the cement by means of compressed air.

AN INTERIOR AT FRINTON-ON-SEA

C. F. A. VOYSEY, Architect

C. F. ANNESLEY VOYSEY

The Man and His Work—IV

It is the exception to find an artist who gives first place to those of his works for which he is best known and which most strikingly commemorate his peculiar gifts. I think it is with Voysey as it is with many artists in many fields of Art: he does not truly estimate his own achievement; it is rather usual for him to esteem highly works which do not most effectively represent him, and to think little of those which signalise his genius; or even to be impatient of the attention given to what cost him little thought or trouble. It is the case with every true artist that each achievement is the jumping-off ground for the next; each work is a reaching out for something beyond the "old joy," a new adventure; and in looking back upon his own performance a man is apt to set most store, if not upon that which cost him the most pains, at least upon that in which he solved the most difficult problems, adventured most, and aspired furthest. On the other hand, a man does best what he performs with most ease; and the task which calls for the greatest effort is often merely the means by which he is enabled to accomplish another and simpler one with masterly accomplishment.

Voysey's directive impulse or principle is, as we have seen, simplicity; his individuality is identified with a logical elaboration of that motive of simplicity; and the perfection which is reached in some of his designs, and touched in many, is, in my opinion, identified with those works in which this sentiment of simplicity is most strongly presented. In some of his buildings the number of the features or parts seem to elude the architect's capacity to combine them into one comprehensive design. Of these designs it is to be said that they are not simple. Our perception of them is confused; their unity is not apparent; some of them even lack a beginning, a middle and an end; they are not remembered as an idea—as an identity—

but as an agglomeration of parts which veil or confuse the conception of an idea. It is true that there are many mediæval buildings—Penshurst, for instance—which have this quality and which yet delight us; but the pleasure we receive from them is not of the building as a design, or even as a building: it depends upon the building having happened, and upon its various happenings being redolent of history, of traditions of building craft, of bygone life. This appeal cannot be claimed by a new building. When, for instance, Bentley built the Convent at Hammersmith, he produced a rambling mass of buildings which, although seeming entirely unpremeditated, yet constitute one complete and definite design which has an identity and in no way impresses us as an agglomeration of separate parts.

I have purposely overstated what I deem to be a defect in some of Voysey's more ambitious designs in order to make a clear comparison with those designs which I think signalise his important contributions to modern architecture, and in order that I may be obliging in following Voysey's instructions to "say what you don't like about my designs." I have not, however, included any illustrations of what I consider to be the culprit buildings, in spite of the invitation to "say how bad they are," but the house at Combe Down, which is illustrated at the head of the second of these articles, will serve to instance the particular in which I think the architect sometimes loses touch with his characteristic motive of simplicity. I chose the example for illustration because it is a stone house, because it represents Voysey in close relation to tradition, and because it is in many ways a charming design. It is a building which will improve with time. When it has stood for a hundred years and its origin on an architect's drawing-board has been veiled by mossy eaves and weather-stained

AN INTERIOR AT BEACONSFIELD

C. F. A. VOYSEY, Architect

ashlaring, it will convey a different meaning; but this similitude to the adventitious ways of mediæval builders, which no doubt coloured the mind of its designer, serves to illustrate what I have spoken of as a weak point in some of Voysey's work. Whether we approve of the system or not, the only way to produce a work of architecture in these days is by employing an architect, and it is impossible to estimate any architect's work except as design. So regarded, I object to this Combe Down House because there is no expressed reason why it should end where it does. It has the effect of being part of a house: in years to come it might seem that a ruined church tower has at some time been reconditioned and adapted to the needs of a cottage. The design is not simple; it is illusive: the motive seems to me not simple, but oblique. The architect was not, I think, here concerned only to let simplicity express itself; there was, and I deeply regret to have to say it, a less chaste motive involved. I am afraid Voysey revelled a little in this design: but as my window cleaner said the other day, "We can't all be perfect."

I do not place this building among Voysey's most successful designs, although it remains a memorable little house. It would be an arresting and delightful thing to come upon unawares, and although it falls away from Voysey's principles and differs from other work of his with which I am acquainted, no one would have any difficulty in recognising its authorship.

I said in speaking of the Chorley Wood House that it would be difficult to imagine anyone wishing to alter a single detail of it except possibly the buttresses. I will not say that I object to the buttresses in this house, they seem to belong to it and they complete the idea it expresses; but as a purist I am not as fond of buttresses as Voysey is, although Voysey is a greater purist than I. I have badgered Voysey about his buttresses, for they were characteristic of his work at one time; they had not before been used as he used them; he left off building them, and the feature has not been adopted by other architects. The occasion for these buttresses is

related to the roughcast walls they fortify. It must be remembered that thirty years ago there were scarcely any good hand-made facing bricks. I believe I am right in saying that Sir Edwin Lutyens was largely responsible for galvanising our brickyards into producing the delightful varieties of beautiful bricks that are now at the disposal of everyone, and that he did this by importing Dutch bricks, to the consternation of British brickmakers. When Voysey began to build, the only bricks readily to be obtained were of the deadly machine-made kinds, which are still represented in standard specification clauses of the text-books, which exactly describe all that bricks and brickwork should, for nearly every purpose, never on any account be. Voysey used roughcast because he found that clients who came to him wanted inexpensive houses, and because an 11-in. hollow wall "isn't a wall at all." A 9-in. brick wall, roughcast, was the cheapest weathertight wall that could be built, and buttresses were introduced to restore to the wall the stiffness which it lacked. That stiffening by buttresses was probably not so much an actual constructive need, in an engineering sense, as an expression of the architect's aesthetic sense of a solid and adequate construction. The wall was reduced in thickness below what was the general practice, and the architect sought to correct the weakness this innovation caused. In these days when the schools of architecture appear to justify any architectural feature for the sake of its part in a composition, or because of its association with another feature, it would be unfair to ask Voysey to show the constructive need of every buttress he introduced into his designs, although he had to face that criticism in the more discerning days when they first saw the light.

I have so far said nothing of the insides of Voysey's houses, yet Voysey's insides are, in more than one sense, the most lively and entertaining thing about him. Schools of architecture not having at that time set their cloven hoof-mark on principles, and taught mankind that a house should be designed from the outside and that the scullery window may balance that

of the drawing-room in order to give the building the appearance of being something it is not, it was the custom to make the outside of a house conform to its individual inward needs; thus the strict logic of Voysey's approach to house design found particular opportunities for expressing itself within doors. In these pages photographs are shown of certain interiors in which not only the finishings, but the furniture, fabrics and wallpapers, are of Voysey's design. I shall speak of this part of his work in my next and concluding number, and will only here call attention to the cheerfulness and freshness and practical efficiency of the interior finishings. To understand the force of the originality displayed, it is necessary to recall what was customary at the time these ideas were made common property, for since they have become common property and all architects, when they set about designing small houses are, whether they know it or not, Voysey's heirs, and follow as by nature the path he showed them, the vigour of the leader who showed them that path is obscured. Voysey's case is very parallel to that of Kipling: no one who does not remember the appearance of "Plain Tales from the Hills" can have any adequate idea of the force and original genius of the writer, for the atmosphere he created has since seen the vital element of all short story writers. In the same sense that Kipling invented the short story, Voysey may be said to have invented the small house. Ironmongery, the east-iron mantel register, joinery, the use of all kinds of materials in new ways—in these matters Voysey was not only prolific in ideas, but set architects in a new relation to their work. It is not only the things he did, but more particularly the spirit in which he addressed himself to his tasks, which places architects and architecture in his debt. How fundamental are his teaching and his practice is shown by the eagerness with which the whole fabric of his design has been seized on by foreign nations. Not once but several times publications in Holland, Germany and elsewhere have been specially allocated to the display of his work in elaborate and costly productions. It always seemed to me that the short-lived and ill-inspired "l'Art Nouveau" had its inception in a hurried misinterpretation of the new Voysey vogue. I have, however, no justification for saying this except the impression I received when I visited Paris, Switzerland and North Italy twenty-five years ago.

Competition Notes

Meanwood Park Colony

The Corporation are inviting Mr. John Kirkland, F.R.I.B.A., Architect to the Board of Control, to act as assessor in connection with the architectural competition for the extension of the Meanwood Park Colony.

Oxford Elementary School

The Education Committee are inviting selected architects to submit plans for the new secondary school for boys.

Practical Homes Competition

This competition is open to everyone holding or acquiring before May 8 the freehold or leasehold interest in a vacant plot of building land at Angmering-on-Sea, Sussex. Any reader proposing to build a house or bungalow shall be entitled to enter that house or bungalow for the competition as soon as a copy of the necessary building plans, duly approved by the local authority, have been submitted to the editor of *The Lady*. For the preparation of these building plans competitors are at liberty to employ any architect that they may select. The following prizes are offered: (Class A)—Houses or bungalows costing not less than £1,200—Prize: £250;

(Class B)—Houses or bungalows costing not less than £800 nor more than £1,200—Prize: £150; (Class C)—Cottages or bungalows costing not less than £500 nor more than £800—Prize: £100. Full particulars from "Moirs" at *The Lady* Offices, 39 and 40 Bedford Street, Strand, W.C.2.

Bognor Town Hall

The President of the R.I.B.A. has chosen Mr. Austen Hall as assessor in connection with the judging of the designs for the new Town Hall for the Urban District Council.

Berwick-on-Tweed

The architect for the developments proposed at Berwick-on-Tweed by the Berwick Theatre, Ltd., Bank Buildings, Berwick, is Mr. Albert Schofield, F.R.I.B.A., of 30 Houghton Street, Southport, who resides at Ainsdale. Mr. Schofield was successful in a "limited" competition, a number of architects having been written to and invited to submit plans. The scheme, it is understood, comprises the erection of a modern cinema theatre, to accommodate about a thousand persons, the construction of shops, an arcade and a café.

Coming Events

Birmingham Architectural Association.—Friday, February 18.—Annual Dinner.

The Architectural Association.—Monday, February 21.—Mr. Howard M. Robertson, F.R.I.B.A., on "Architecture in America." 35 Bedford Square, W.C.1.

Edinburgh Architectural Association.—Monday, February 21.—Mr. W. A. M'Cartney, A.M.I.C.E., on "Some Things We Might Do Better."

Association of Special Libraries and Information Bureaux.—Wednesday, February 23.—Mr. G. F. Barwick on "Directory of Sources of Specialised Information." At the Rooms of the R.I.B.A., 9 Conduit Street, W.1. 6.30 p.m.

South Wales Institute of Architects.—Wednesday, February 23.—Mr. W. S. Purchon, M.A., on "The Work of Sir Christopher Wren."

Liverpool Architectural Society (Inc.).—Wednesday, February 23.—Miss Mary Adshead on "Modern Decorative Painting." (Lantern slides.)

The Surveyors' Institution (Northumberland and Durham Branch).—Thursday, February 24.—Mr. Wm. Townend on "Valuation of Licensed Properties."

The Geffrye Museum.—Thursday, February 24.—Mr. H. Woodman on "Silks and Other Materials for Furnishings." Kingsland Road, E.2.

The Association of Architects, Surveyors and Technical Assistants (Metropolitan Division).—Thursday, February 24.—A visit to the new premises of Messrs. Austin Reed, 113 Regent Street. At the address, 6 p.m.

Association of Architects, Surveyors, and Technical Assistants (Midland Counties Division).—Friday, February 25.—Mr. B. J. Aston on "A Review of Modern Wall Decoration." Birmingham Chamber of Commerce.

The London Society.—Saturday, February 26.—A visit is intended to the new headquarters of the British Medical Association. It is hoped that Sir Edwin Lutyens will be back in time from India to attend this visit.

The Royal Institute of British Architects.—Monday, February 28.—Mr. Harvey Corbett on "Organisation and Cost of the Building Industry in America." 8 p.m. Conduit Street, W.1.

Manchester Building Trades' Exhibition.—March 29-April 9.—Particulars from Provincial Exhibitions Ltd., City Hall, Manchester.

NATIONAL PROVINCIAL BANK, EDGWARE.
MESSRS. SUMNER & YOUNG, Architects.

Correspondence

SIR,—I do not at all mind being told that I write journalese by a writer who shrinks from using so coarse a word as “cart” and prefers to put the “vehicle before the horse,” but otherwise I am tempted to reply in full to my friend Maurice Webb’s boisterous letter, for he is so closely identified with the schools of architecture that he is entitled to regard any disparagement of them as adverse criticism of himself. This justification for his spirited protest is, however, a justification for my excusing myself from accepting his challenge. I could only do the thing at some length, and the affair would raise “tally-wack and tandem,” as they say in Ireland. I have had a try, and I know! I can only say that I have no wish, on any grounds, to alter a word which I wrote, and have no apology to make to our friend Voysey, who without question, although I have no

authority to say so, agrees with my remarks. My assailant’s strong objection to the passage in question is not explained—although his logical method may be—by his finding no meaning in it; but the fact that it has no meaning for him is not conclusive of its having no meaning for other readers, but, in my view, rather confirms my contention that the schools of architecture, which are admitted to be identified with my opponent’s bias of mind, neglect the practice of thinking and feeling.—I am,

Yours faithfully,

“THE WRITER OF THE VOYSEY ARTICLES.”

The death took place recently of Mr. Arthur Wells, F.R.I.B.A., whose work during the development of Hastings over the past half century is to be seen in the Gaiety Theatre, the White Rock Baths, St. Helen’s Secondary School, Palace Hotel, and other buildings

THE TWENTIETH CENTURY HOUSE

VI.—Ventilation and Sunlight

By A. TRYSTAN EDWARDS.

Before discussing in detail the various types of housing accommodation and the plans and elevations which may be associated with each type, it was necessary to undertake this preliminary analysis of the effect which the modern standards of hygiene have had upon architecture. It is not unlikely that in times to come the historian will single out as one of the characteristics of the 19th century that it was pre-eminently the century of fads. Every kind of faddist flourished in that period, and among faddists were a certain number who turned their attention to architecture. Now a faddist is a person who gets hold of some aspect of the truth and exaggerates its importance, with the result that other aspects are neglected. It is notorious that hygiene is a subject very dear to the faddist, who will not only exalt hygiene at the expense of manners and other spiritual attributes worthy to be cultivated by men and women, but will even exalt one element of hygiene at the expense of another equally necessary to our health and well-being. In the realm of dress the hygiene faddists get short shrift, for the simple reason that the art of dress is well understood to be subordinate to social convention, and people are not entitled to divest themselves of their clothing at will or to don garments which are designed with no other object than to promote the health of the wearer. The rules of dress, of course, take account of climate and of the occasion on which any particular costume is worn. For instance, costume designed by people indulging in violent exercise differs from the ordinary every-day habiliment used by those engaged in sedentary occupations. But, nevertheless, dress serves not only health, but manners, and it is for this latter service that most of its ritual and ceremonial is devised. Similarly in architecture hygiene cannot be allowed to vanquish manners, and I am venturing to assume that the designers of the 20th Century House will eventually free themselves from all the various fads and narrow sectarian views which are often characteristic of the enthusiasts for hygiene.

I have devoted four articles to the formulation of a method whereby it will be possible to prevent the smaller domestic offices necessary for cleanliness and sanitation from showing themselves too obtrusively on the façades of buildings. With this object I gave a number of illustrations of an architectural feature called the "recess," which was shown to be capable of assuming a diversity of form. It was necessary to multiply the examples of this feature in order that its range and flexibility might be established; for otherwise, if the recess had seemed to be confined

to one or two standard types to be repeated *ad nauseum*, its usefulness and popularity would have been greatly diminished. It may be mentioned here that in addition to screening sanitary pipes and bathroom and closet windows, the recess may also accommodate rain-water pipes, flues from geysers, and ladders for fire escape.

Having mastered that element of hygiene symbolised by the recess, and having made it subordinate to manners, what other hygienic factor is there which has a decisive influence upon the forms of building? Obviously there remains to be considered the problem of giving to all the rooms of a house the requisite amount of ventilation and sunlight. Now here, unless we guard ourselves against it, our love of sunlight may easily lead us to commit architectural offences of a serious nature—just as, in our ordinary lives, the pursuit of health, when indulged in by people altogether devoid of a social sense, may lead to abuses. I propose to examine some of these architectural offences which the "sun-worshippers" may unwittingly commit, not with the object of belittling the value of sunlight, but in order that it may be possible to reconcile the claims of hygiene with other architectural values which cannot be neglected. The 20th Century House should be a mature conception, utterly free from "crankiness" or faddism.

Let us start with the assumption that it is desirable to provide every room of the house with as much sunlight and ventilation as possible. There is no need to enlarge upon the curative properties of sunlight; its power to purify the atmosphere and to vanquish the germs of disease are already an established fact. It remains for the architect, however, to plan houses and streets in such a fashion that the maximum of sunlight will penetrate into the rooms, and especially into what are called the living-rooms of a dwelling. Certain main facts about the sun are, of course, known to everybody, namely, that it rises in the East and sets in the West, that it is due South at mid-day, and that it reaches a higher altitude in summer than in winter. If in their planning of houses architects were invariably to take account of these simple facts our homes would be very much more pleasant to live in than they are. But it behoves an architect to know much more about the incidence of sunlight than this, and before we examine house-planning in any detail it may be of advantage if we consider a few additional facts concerning the sun in so far as they have a bearing upon domestic architecture. Some of these facts are encouraging and others are discouraging. Let me take the latter first, in order that architects

Fig. 22

Fig. 23

Fig. 24

may not be blamed for a state of affairs which is due to his own inability to make a hygienic plan. Some of the devotees of sunlight expect a little too much from the architect, and imagine that he can provide a plan in which the direct rays of the sun can exert their purifying influence over all the rooms of the house. Unfortunately this is not the case. For the destruction of germ life it is only the direct ray which is powerful in this respect, and the illumination which merely comes from the sky, though it makes a room habitable and to a certain extent even cheerful, has not this property in the same degree. It is important, therefore, to distinguish between sky-light, *i.e.* the light obtained in a room from such part of the sky as is visible from the windows, and the ray which comes direct from the sun unobstructed by cloud or other atmospheric conditions.

Statistics given in "Whittaker's Almanac" show that while even in June the sun shines on the average for less than half the day, in December, when the day itself is very much shorter, the average period of sunshine is less than a tenth of what would be possible but for clouds and mists. Moreover, the altitude of the sun at mid-day in December is only 15 degrees, so even at the most favourable time of the day no direct sunshine could penetrate into the rooms unless there was an unobstructed view of the sky below a plane cutting through the window-sill and making an angle of 15 degrees with the horizontal. This means that in a street running East and West, an ordinary cottage on the South side of the street, with ground floor and one upper floor, would need to be 70 feet away from a similar sized cottage exactly opposite it in order to obtain a passing glint of the sun at mid-day (and even this is on the improbable assumption that the sun happened to be shining at this particular moment). A continuous street running North and South could not possibly obtain any direct sunshine worth talking about except between May and July, for the simple reason that when the sun happens to be opposite the windows it is so low that it will be obscured by the houses on the other side of the street unless these are very far away. I cite these facts in order that the difficulties of the architect's problem may be realised. But there is no need to paint the picture in too gloomy colours. In summer time and even at the equinoxes we are blessed with quite a considerable quantity of sunshine in this country, and from the hygienic point of view, if only we allow this sunshine to penetrate into the streets, that should be sufficient to purify the air inside the houses, provided they be well ventilated.

It may be admitted that in order to obtain the maximum of sunlight and ventilation which is possible a house must be detached and at a fair distance from the neighbouring houses. Figs. 19 to 24 show in diagrammatic form certain possible dispositions of houses placed in alignment with roads. While the detached house in its own extensive grounds is a

highly desirable thing, we have to take account of the fact that the vast majority of houses are destined to be set on comparatively small plots of ground, and for convenience of access and economy of drainage they will be arranged in straight lines, as in Figs. 19 to 24. It will be observed that while Figs. 19 and 20 show examples where the houses are close together, and in the former case direct sunlight will only penetrate the houses on the South side (except at mid-summer), while in the latter the South-East aspect will be the most favoured. In Figs. 21 and 22, however, although the houses are just as close together, their configuration is such that they have some of the advantages of complete detachment in open country. No matter what the orientation of the road may be, houses arranged as in these two examples are favourably situated as far as sunlight is concerned. The example shown in Fig. 23, where pairs of houses are disposed in a similar fashion, provides for each house three sides with unobstructed views. It is highly questionable, however, whether a formation which is so lacking in architectural cohesion, and which, in providing no façades parallel to the road, discourteously ignores the common thoroughfare, is to be commended. If such an arrangement were to become the rule, if this jerky diagonal formation were characteristic of a majority of suburban streets, we should rebel against it, and insist upon a lay-out which did less to offend our æsthetic sense. Fig. 24, which shows houses especially designed with their principal rooms facing South-East, is another abortion, for it expresses a complete disregard for every other architectural consideration except sunlight. Such a lay-out is the creation of cranks and faddists. In the next article I propose to consider how sunlight and ventilation can best be brought into houses which in plan and lay-out are devoid of eccentricity.

Obituary

Sir Wilfred Stokes.

We regret to announce the recent death of Sir Wilfred Stokes, K.B.E., M.Inst.C.E., the eminent engineer. Sir Wilfred, who was 66, was a brother of Leonard Stokes, the architect and former President of the R.I.B.A., who died in 1925, being the youngest of the five sons of Scott Nasmyth Stokes, of whom only Mr. Adrian Stokes, R.A., now survives. Sir Wilfred had a wide experience in the design of bridges, dock sluices, cranes and other machinery. He will probably be best known to posterity as the inventor of the Stokes gun, the famous trench mortar that proved so valuable in the Great War, and for which he received his knighthood. Among architects, artists and lovers of London, he will always be remembered for his spirited defence, as Chairman of the Conference of Engineers, of Waterloo Bridge.

BUILDING CRAFTSMANSHIP—OLD AND NEW—VII

By Nathaniel Lloyd, F.S.A.

Fig. 1.—THE PULPIT, MORDEN COLLEGE CHAPEL.

Morden College, Blackheath, founded and endowed by Sir John Morden for decayed merchants of the City of London, was built to the designs of Sir Christopher Wren, under "his able and honest master mason, Edward Strong" *circa* 1695-1702. The chapel is furnished in oak, panelled, inlaid and carved in the manner of Grinling Gibbons, although his name is not associated with the work. The oak is entirely unstained and unvarnished, and is a model of what oak should be in its natural colouring. Fig. 3 shows the interior of the chapel, through the elliptic-headed doorway, with its beautifully carved key block and spandrels. The detail of the moulding enrichments is also very fine. Fig. 1 brings out the quality of the pulpit design and detail, while Fig. 2 shows parts of the altar and sanctuary rail. The shelf above the altar is modern. One cannot fail to be impressed by the interesting inlay, all of the same oak as the framing but set with grains running in different directions.

London Building Notes

BLACKFRIARS.—The Peabody Donation Fund are proposing to sell, for development purposes, a piece of land in Webber Street, Blackfriars Road, S.E., having an area of about 450 sq. ft. and a frontage of 33 ft. Business premises, it is understood, are to be built.

CLEVELAND STREET.—Messrs. Holland & Hannen & Cubitts, Ltd., 256, Gray's Inn Road, W.C., have in hand the construction of the foundations, etc., of the new Courtauld Institute of Bio-Chemistry, to be built for the Middlesex Hospital in Cleveland Street, S.W.1. The sub-contractors for the excavation work are Messrs. B. Goodman, Ltd., Haggerston Road, E. The architect is Mr. A. W. Hall, F.R.I.B.A., 17 Southampton Street, W.C.

COVENT GARDEN.—The Governors of St. Peter's Hospital, Covent Garden, W.C., propose to acquire an adjoining block of business property in order to enlarge their institution. Plans have been prepared by Mr. F. Fox, of 86 Petty France, Westminster, S.W.1.

DOLLIS HILL.—The Governors of the St. Andrew's Hospital have decided to increase the number of beds, provide a children's ward, and build a home for the nurses and staff, at a cost of £30,000. Plans have been prepared by Mr. T. H. B. Scott, 11-13, Finsbury Square, E.C.2.

GREAT PORTLAND STREET.—A building to be used as offices and show-

rooms is being erected upon the corner site in Great Portland Street and Langham Street, W.1, the builders being Messrs. Perry & Perry, of Woodstock Road, W. The plans have been prepared by Mr. William A. Lewis, A.R.I.B.A., 11-12 Finsbury Square, E.C.2.

HAMMERSMITH.—Building operations have recently been commenced in connection with the proposed erection of a number of houses on the Wormholt Estate, Hammersmith, W., for the L.C.C. The contractors are Messrs. Wilson, Lovatt & Sons, Ltd., Clarence Street, Wolverhampton, whose tender was accepted at £433,000. Mr. G. Topham Forrest, F.R.I.B.A., architect.

HARROW-ON-THE-HILL.—It is proposed to build a new hall and institute in connection with St. George's Church, to involve an expenditure of about £8,000. The architect is Mr. C. A. Farey, F.R.I.B.A., 19 Bedford Row, W.C.

HOUNSLOW.—A block of premises is to be erected in Hounslow High Street for the Gas Light and Coke Co., Ltd., for use as a branch depot and show-rooms. Mr. H. Austen-Hall, F.R.I.B.A., architect, 8 Old Jewry, Cheapside, E.C.2.

KINGSLAND ROAD.—An expenditure of over £60,000 is involved in the new additions which are being erected at the Metropolitan Hospital in Kingsland Road, N. The builders are the Pitcher Construction Co., Ltd., 57 Ashburton Grove, N.7, whilst the building

has been designed by Messrs. Young & Hall, 17 Southampton Street, W.C.

MILLBANK.—A corner site at the junction of Millbank and Great Smith Street, Westminster, S.W.1, has been leased by the L.C.C. for building purposes. The new lessees propose to erect a block of residential flats with a total street frontage of about 150 feet. Mr. Matthew J. Dawson, F.R.I.B.A., architect, 11 New Court, Lincoln's Inn, W.C.

PORTLAND PLACE.—In connection with recent property transactions on the Portland Estate, a block of residential flats is to be erected at No. 73 Portland Place, W.1, to replace the old Victorian town house which previously occupied this site. Messrs. Wills & Kanla, architects, 3 Southampton Street, W.C.

REGENT STREET.—In connection with the enlargement—to cost over £250,000—of the Regent Street Polytechnic Institute, W.1, it is announced that the building programme will include the following:—Mrs. Quinton Hogg memorial wing (Women's Club), £30,000; school of commerce, £20,000; new motor body building and motor engineering school, £15,000; new architectural school, £15,000; school for professional examinations, £10,000; new chemistry laboratory, £10,000; new library, £7,500; new tailoring school, £5,000. The first section of the new buildings is being carried out by Messrs. Nox, Ltd., Praed Street, W.1, under the direction of the architect, Mr. F. J. Wills, F.R.I.B.A., 62 Oxford Street, W.1.

Competitions Open

BIRMINGHAM CIVIC CENTRE

Competitive plans are invited, not only from this country but abroad, for the development of the future civic centre of Birmingham around the Hall of Memory. The assessor is Mr. H. V. Lanchester, F.R.I.B.A. First premium £1,000 and a further sum of £1,000 will be divided among other competitors on the recommendation of the assessor. Sending-in day, June 30, 1927. Conditions can be seen at this office.

INCORPORATED ARCHITECTS IN SCOTLAND

This competition is open for the Rowand Anderson Medal and £100, for a City Art Gallery and Museum; the Rutland prize of £50 for Study of Materials and Construction; prizes of £10 to £15 for Third Year Students in Scotland and a Maintenance Scholarship of £50 per annum for three years. Particulars from the Secretary of the Incorporation, 15 Rutland Square, Edinburgh.

PETERBOROUGH MUNICIPAL COMPETITION

In connection with the £200,000 scheme to widen Narrow Street, Peterborough, the Peterborough Town Council are considering proposals for the provision of municipal buildings on the upper floors, and at the rear of the new premises to be erected in the newly constructed street. The Council propose offering a prize of 250 guineas for the best plan submitted. A second prize of 100 guineas, and a third prize of 50 guineas will also be offered. The city engineer estimates that the erection of shops and offices will cost £82,800, and the erection of municipal buildings and shops £158,308.

NEW TOWN HALL AND LIBRARY, LEITH

The Corporation of the City of Edinburgh invite architects, resident or practising in Great Britain, to submit designs for a hall and library. The sending-in date is April 30, 1927, and conditions may be had on application to A. Grierson, S.S.C., Town Clerk, Edinburgh, or may be

seen at the offices of THE ARCHITECT AND BUILDING NEWS. The assessor for the competition appointed by the Corporation is Sir George Washington Browne, P.R.S.A., Edinburgh.

RAWMARSH MEMORIAL

The Rawmarsh and Parkgate War Memorial Committee invite architects to submit designs for this Memorial. The cost, inclusive of fees, not to exceed £2,000. The successful competitors will be invited to act as architects for the erection of the Memorial. A plan of the site may be obtained from Mr. J. A. Tonge, L.R.I.B.A., Surveyor's Office, Parkgate, Yorkshire.

UNIVERSITY OF WESTERN AUSTRALIA

Designs are invited for buildings to cost £150,000, to include great hall, offices, etc. Premiums of £300, £200, and £100 are offered respectively. Closing date, August 23. Conditions will be obtainable about the end of January from the Agent-General for Western Australia, 115-116 Strand, W.C.2.

SHAKESPEARE NATIONAL MEMORIAL THEATRE

The Governors of the Shakespeare National Memorial Theatre invite architects to submit designs for the Shakespeare National Memorial Theatre, Stratford-on-Avon. The competition will be open to architects of the British Isles and America. It will be in two sections—a preliminary competition for sketch designs only, from which six designs will be selected by the assessors: Mr. E. Guy Dawber, President, R.I.B.A., and Mr. Cass Gilbert, President of the National Academy of Design of America (who will both act in an honorary capacity), and Mr. Robert Atkinson, F.R.I.B.A. Conditions of competition, with site plan, etc., can be obtained from the Secretary, Shakespeare Memorial Theatre, Stratford-on-Avon, on payment of a deposit of £1 ls. Preliminary designs must be delivered to Stratford-on-Avon not later than June 15, 1927.

"TRICITY RESTAURANT," STRAND, LONDON: THE VESTIBULE AND THE RESTAURANT.
MESSRS. IMRIE & ANGELL, Architects.

Building News in Parliament

WESTMINSTER, Wednesday, February 16.

During this Session of Parliament it will be as difficult to get measures other than first-class Government Bills on to the Statute Book as it would be for a camel to pass through the eye of a needle. The Government are resolved that the Session is to finish about the end of July, so that the next session may begin, under the reformed system, in November. Thus there will be no autumn continuation of the present sitting of Parliament, as was the custom during many recent years, and the time at the disposal of Members must be relatively short. The Government have been very chary in their promises of legislation, and they give no undertakings beyond saying that, "if time permits," certain Bills may be dealt with. It may be assumed that the expected measure in reference to slum clearances comes within this category. When he was questioned yesterday on this matter, Sir Kingsley Wood, speaking for the Minister of Health, said the Government have the subject of slum clearances under consideration, but he did not think it would be practicable to introduce a Bill this Session.

This restriction upon the Parliamentary time-table must react upon the prospects of private Members' Bills, including the measure to provide for the registration of architects, which has been presented by Sir Clement Kinloch-Cooke. The second reading has been fixed to take place on Friday, April 8. If the sponsors of the Bill succeed in persuading the House of Commons to give it a second reading, the Bill will have to go to one of the Standing Committees, and there the speed of its passage and the likelihood that it will reach the Statute Book this year must be determined by the opposition, if any, which it encounters.

No decision, apparently, has yet been reached by the Government with regard to the report of the Royal Commission on Waterloo Bridge. The Prime Minister said yesterday that he was not in a position to make any statement. He added that, in response to a request which he had received, he hoped to meet a deputation from the London County Council on an early date. It is almost certain that the question of the London bridges will be debated again in the House, probably during an early part of the Session.

Another subject which is certain to cause many questions to be directed to the Minister of Health is the housing subsidy. Mr. Chamberlain committed himself last Session to the opinion that the greater the subsidy, the greater becomes the cost of erecting State-aided houses. Attempts will no doubt be made to subject this opinion to the test of fact, as reflected in the price of buildings on which the reduced subsidy is paid.

The private bill which has been promoted by a Trust Company, proposing to remove Covent Garden Market to the old Foundling Hospital site at Bloomsbury, was presented and read a first time in the House of Commons. As there is considerable objection to this measure inside the House, it is probable that its second reading will be deferred for a considerable time.

Shakespeare Memorial Theatre

In a report recently presented at Stratford-on-Avon Town Council it was stated that Alderman Flower had reported to the General Committee that the Governors of the Memorial Theatre had decided to erect the new theatre on the old site and on the portion of the Bancroft now approximately occupied by the bandstand enclosure. It was agreed to make the suggested exchange with the Governors of the Memorial Theatre.

The Royal Sanitary Institute

The Henry Saxon Snell Prize for 1927, offered by the Royal Sanitary Institute, will consist of fifty guineas and the Medal of the Institute, and is offered for an essay on "Sanitary Accommodation, Appliances and Fittings, for Hotels and Flats, with suggestions as to proper placing, arrangement, ventilation and lighting, particularly where there are no external walls in which windows can be placed." Full particulars from Mr. E. White Wallis, 90 Buckingham Palace Road, London, S.W.1.

"Tricity Restaurant"

Fourteen years ago was established "Tricity House" in Oxford Street, where "everything was done by electricity." The founder, Mr. A. F. Berry, realising that the identical principles might be worked on a much larger and better scale, has now established a new "Tricity Restaurant" at the top of Savoy Street, in the Strand, where the whole of the lighting heating and cooking is effected by electric power.

The restaurant itself has been carefully designed to give a rich yet restful effect. The detail is full of interest, and has been designed with the principles of modern electric lighting in view, in this case a diffused light, the colour of which can be completely controlled at will. Messrs. Imrie & Angell were the architects for this singularly modern restaurant.

Mr. Stephen Wilkinson, of London, consulting architect to the London and North-Eastern Railway Co., has been appointed architect to the Lancashire County Council in succession to Mr. Henry Littler, who has retired after 30 years' service.

The Week's Building News

The following abbreviations are used: U.D.C. for Urban District Council; T.C. for Town Council; R.D.C. for Rural District Council; E.C. for Education Committee; B.G. for Board of Guardians; P.C. for Parish Council; B.C. for Borough Council; M.H. for Ministry of Health; M.T. for Ministry of Transport; C.B. for County Borough; B.E. for Board of Education. Direct confirmation should be obtained before commitments, for which we cannot be responsible, are made.

ABRAM.—At the monthly meeting of the Abram Council the Council approved that the clerk seal the contract for the erection of 40 non-parlour houses on the Bickershaw site. The amount involved is £17,280.

ANSTRUTHER.—At Anstruther Dean of Guild Court plans were submitted for a new golf cleek factory, to be erected on a field opposite Station Road. The Court unanimously passed the plans.

BARNET.—The Governors of the Barnet Hospital and Institution propose to carry out improvements to their buildings, including the reconstruction of the casual wards, etc. Messrs. Trant, Brown & Brightiff, A.R.I.B.A., architects, 332 High Road, Kilburn, N.W.6.

BARNESLEY.—The T.C. have built 1,650 houses, and a further 213 are nearing completion. Barnesley Corporation proposed to convert the ground floor of the old Corn Exchange into three shops, at an estimated cost of £3,600.

BARNESLEY.—Revised plans are being prepared for the erection of the proposed Mining College and Technical Institute. The cost of the latest scheme submitted by the architects, Messrs. Briggs & Thornely, Royal Liver Buildings, Liverpool, was £100,000, and they have now been asked to modify the scheme.

BECONTREE.—A new cinema is being erected at Dagenham for Mr. John Kay, of Oxford Street, W.1. referred to in THE ARCHITECT AND BUILDING NEWS of November 19, 1926. The contractors are Messrs. F. Greenwood & Son, Mordaunt Road, Harlesden, N.W. Mr. Ed. Meredith, A.R.I.B.A., Architect, Goodmayes, Essex.

BERKHAMSTED.—The U.D.C. are to build 55 houses on the Sunny Gate Lane Estate.

BINLEY.—The Colliery Co. propose to erect over 300 houses within the next twelve months.

BRIGHTON.—The Brighton Equitable Co-operative Society, Ltd., 95 London Road, Brighton, have decided to build new branch departmental stores on a site in Islingward Road. Plans have been approved, the architects being Messrs. Bethell & Swannel, 16A John Street, Adelphi, W.C.2.

BROWNHILLS.—The magistrates recently sanctioned the plans of a new picture palace in High Street, Brownhills, which were presented by H. Jervis, of Walsall Wood. This has been designed to seat 500 and is to be built of brick and steel.

BURTON-ON-TRENT.—Burton-on-Trent T.C. recently referred back to the Housing Committee for further consideration a proposal to buy 43 acres at Rosliston Road to build 300 houses. The cost of the site was £7,500, and the objections were that the site was unsuitable, and that the town could not

afford the additional burden of another housing scheme.

CARDIFF.—Upon a site at the junction of Dumfries Place and Queen Street, Cardiff, a cinema is to be erected by Mr. A. E. Abrahams, of 25 Shaftesbury Avenue, London, W.1.

CHATHAM.—The foundation stone of the £38,987 extension of the hospital at the Medway Poor Law Institution at Chatham was laid recently by Alderman H. J. Cloke, Chairman of the Guardians. The additional buildings will provide accommodation for 120 beds, a small isolation block for 8 beds, and a tuberculosis block for women with 12 beds will also be erected, in addition to the main building. Mr. C. W. W. Thompson, F.R.I.B.A. (Rochester), architect.

COLWYN BAY.—At an estimated cost of over £100,000 a Lancashire syndicate propose to erect on the sea front a pavilion, with concert hall, dance hall, winter gardens, swimming pool, and ornamental grounds.

CLACTON-ON-SEA.—Plans have been prepared by Sir Brumwall Thomas, F3 The Albany, Piccadilly, W.1, for the erection of a new town hall for the Clacton U.D.C. The new building will cost about £65,000.

CROYDON.—Croydon licensing justices recently granted an application for the building of a new hotel at Croydon Aerodrome. The building, equipping, and furnishing of the hotel will cost at least £50,000, and will provide accommodation for every class of person, those leaving and arriving by aeroplane, pilots, staff of the aerodrome, and a large number of other people.

DUNFERMLINE.—Plans were passed at Dunfermline Dean of Guild Court recently for alterations at the Dunfermline and West Fife Hospital. The probable cost of the extension is £50,000, including equipment.

EDINBURGH.—Edinburgh Housing and Town Planning Committee of the T.C. are proceeding with the Craigentinney scheme. The burgh engineer in his report on the matter said the Corstorphine area of approximately 8,000 acres seemed to be ready for a scheme, as also was the Colinton and Craiglockhart area of about 5,000 acres.

EPSOM.—At a cost of £514 each, 120 Epsom Council houses are to be built.

FORRES.—The proprietors of Forres Lyceum Picture House purpose erecting a new picture house, building operations for which are expected to commence shortly.

FLEETWOOD.—It is proposed to erect new club premises on a plot of land in Copse Road, for the local branch of the British Legion. The estimated cost is £3,000.

GABRAM.—Contracts have been entered into for the erection of 40 non-parlour houses on the Bickershaw site, to cost £17,280.

GLASGOW.—Glasgow Corporation Housing Committee recently agreed to recommend that the construction of the roads and sewers at Knightswood No. 8 housing scheme be carried out by the Housing Department. The Committee also approved of the scheme recommended by the Sub-Committee on Insanitary Areas to demolish 1,020 slum dwellings in various parts of the city.

GRAVESEND.—The Corporation Housing Committee have decided to erect 50 B type and 50 C type houses on the Kings Farm Estate.

GRAVESEND.—Messrs. Marks & Spenser, Ltd., the bazaara proprietors, are about to rebuild their branch business premises in New Road. Plans have been prepared by Mr. A. E. Batger, A.R.I.B.A., 36 Ebury Street, Westminster, S.W.1.

HAMILTON.—With the approval of the Scottish Board of Health, offers are being invited for the demolition of sections of Castle Street, Hamilton, and the building of new blocks of houses for the reconstructed "old town." In approving the proposals for the "old town" scheme, and those for 160 new houses to be built in School Street area to replace 166 uninhabitable houses in the burgh, the Scottish Board of Health has directed attention to the fact that in the past there have been many overcrowded houses in the town, and has requested the local authority to see there is no overcrowding in the new houses to be erected. More three-apartment and four-apartment houses are therefore to be built than two-apartment houses. In connection with other housing schemes in the burgh, the Board has now approved of plans for 66 houses at Newfield and Linnhouse and 14 houses at "The Yews" to be proceeded with under the Housing Act, 1924. At a meeting of Prestwick T.C. it was reported in connection with the housing scheme that the cost of the two-apartment houses worked out at £353 10s. per house, and of the three-apartment houses at £427 10s. per house, and it was decided that the rents should be £18 and £25 respectively. Over 220 applications for houses, it was stated, had been received. Edinburgh Dean of Guild Court granted warrant in 19 out of 49 petitions, including a bungalow at Ferniehill Road, Gilmerton, and a villa at Braid Hills Road, Liberton.

HANWELL.—The Ealing T.C. have approved (subject to certain conditions) the erection of 96 houses by the Great Western Land Co. in Beechmount Avenue, Hanwell.

HOVE.—The Council propose erecting 100 houses in Old Shoreham Road, at a cost of £47,444.

HULL.—It is proposed to build a large parish hall and institute in connection with St. Jude's Church, Hull, at a cost of about £4,000. The archi-

The Hall Mark of Your Craftsmanship

IN our previous announcements we have confined ourselves chiefly to pointing out how the actual user is keen to appreciate the harmonious distinction that "Crabtree" accessories confer upon your work.

* * *

Yet true Craftsmanship aims beyond the satisfaction of one individual, and those Hall Marks of your workmanship have a far wider application, for they proclaim to all the high standard set up and give your work an individuality of its own.

* * *

To use our Shelloid covers in their varying colours that harmonise so delightfully with the rest of the colour scheme is to accentuate that individuality—and when these covers are used in conjunction with the "Crabtree" Base Rings, you have indeed set the culminating hall-mark of excellence on your work.

tect is Mr. C. D. Aldridge, A.R.I.B.A., Imperial Chambers, Bowllally Lane, Hull.

LINCOLN.—The Council recently approved the scheme for the erection of a Town Hall on the Cattle Market site.

MANCHESTER.—Messrs. J. Lane & Sons, Ltd., builders, Wilbraham Road, Chorlton-cum-Hardy, Manchester, have acquired additional land at Manley Road, St. Werburgh's Road North, Egerton Road and Stamford Road, Chorlton-cum-Hardy, from Lord Egerton of Tatton, where they propose to erect 56 houses. The plans have been prepared by Mr. George Westcott, architect, 13 Bridge Street, Manchester, which provide for brick dwellings of the subsidy type, to be erected in pairs.

MANCHESTER.—Mr. G. W. Boardman, builder, 72 Church Street, Newton Heath, Manchester, has acquired a site with frontages to Boardman Road, Grosvenor Road, Dales Avenue, Wilton Road and Hadden Road, Crumpsall, Manchester, where he proposes to erect 46 houses. The plans have been prepared by Mr. J. Dalby, architect and surveyor, 156 Horton Road, Rusholme, Manchester, which provide for dwellings of brick construction of the subsidy type.

MANCHESTER.—Messrs. T. Fogarty & Co., builders, Tyson Street, Cheetham Hill, Manchester, has acquired an estate at Grange Park Road, Grange Drive and Lea Drive, Blackley, Manchester, where they propose to erect 140 houses. The plans have been prepared by Mr. E. L. Doyle, architect, 36 Esmond Road, Crumpsall, Manchester, which provide for semi-detached dwellings of brick construction of the subsidy type.

MANCHESTER.—A new Congregational Church is to be erected at Claremont Road, Moss Side, for the Congregational Union. Plans have been approved for 16 houses at Sylvan Avenue and Upper Chorlton Road for the Artistic Building Co.; 56 houses at Manley Road, St. Werburgh's Road North, Egerton Road and Stamford Road, Chorlton-cum-Hardy, for Messrs. J. Lane & Sons, Ltd.; 120 houses at Grange Drive, Grange Park Road, and Lea Drive, Blackley, for Messrs. T. Fogarty & Co., Ltd.

MIDDLESEX.—The Gramophone Co., Ltd. (H.M.V.), have decided to carry out a scheme of development at their factory at Hayes, Middlesex. The factory will be greatly enlarged, one "shop" alone receiving 60,000 square feet additional floor space, and more than £207,000 will be spent on new plant and machinery. The building work will be begun immediately, and orders for plant and machinery are now being placed in the Midlands and the North.

NELSON.—Mr. J. P. Earnshaw has submitted plans for the erection of 24 houses at Berkley Street.

NEW ELTHAM.—It is reported that 60 acres of land having frontages to both sides of the Eltham by-pass road, and also in Green Lane and Southwood Road, will shortly be developed. Immediate preparations, it is stated,

are being made for new roads to be cut through the estate, and some 750 houses are to be erected. It is proposed to lay out the estate on the garden city principle to the plans of a well-known firm of architects and surveyors, and each house will be given a garden, with roadways at the side and rear of the house for motor garages.

NEWTON-LE-WILLOWS.—The U.D.C. have decided to erect an additional 152 houses, two-bedroomed type, on their housing site.

PERRANPORTH.—Particulars of a scheme for the erection of a hotel, costing £25,000, at Perranporth were submitted at West Powder Brewster Sessions recently. Mr. H. L. Wislem, of Coventry, applied for a provisional grant of a licence on behalf of Capt. Kenneth Leeming, managing director of Perranporth Bay Hotels.

PICCADILLY.—The owners of the new Park Lane Hotel in Piccadilly, W.1, have purchased the premises of the Savile Club, adjoining, and intend to utilise the site for the erection of an annexe to the hotel, to be used as a ballroom, etc.

PORTMAN SQUARE.—Messrs. Daniel Smith, Oakley & Garrard, and Messrs. H. & R. L. Cobb, 4-5, Charles Street, St. James's Square, S.W.1, have just sold two large sites, Upper George Street and Seymour Place, 60,000 square feet, and Hill Street, Regent's Park, 30,000 square feet, and are now conducting negotiations for the disposal of a further 144,000 square feet, much of it cleared land, in Portman Square. On one of the sites sold large blocks of flats, with shops on the street level and mezzanine floor, will be built.

PUTNEY.—At a recent meeting of the Central Board of Finance of the Church of England, held at Church House, Westminster, it was stated that the plans for the building of the new Whiteland's Training College for Clergy were still under consideration. The architect is Sir Giles Gilbert Scott, R.A., Gray's Inn Square, W.C.2.

READING.—Lloyds Bank, Ltd., have decided to enlarge its branch premises in the Market Place, and for this purpose have acquired the adjoining "Broadfact Hotel." J. P. Briggs, F.R.I.B.A., architect, Effingham House, Arundel Street, Strand, W.C.2.

RESINGTON.—A United Methodist church is to be built at a cost of £6,000.

RICHMOND.—The projected reconstruction of the premises of Messrs. John Cockburn & Co., jewellers, on George Street and Church Court corner is to be put in hand shortly.

RICHMOND.—It is understood that the local lodge of Oddfellows are considering again the question of the erection of an Oddfellows' Hall for the district. A suitable site was selected some years ago, and plans were prepared by Mr. Edward J. Partridge, F.R.I.B.A., Bank Chambers, Richmond.

RICHMOND.—The Council is to build 65 houses on the Manor Road Estate at a cost of £33,700. At a cost of £30,000, St. Andrew's R.C. Hospital, Fellis Hill, N.W., is to be enlarged.

RISHWORTH.—Plans for a proposed new church at Rishworth were submitted and passed.

RUNCORN.—The postal authorities have acquired part of the Bank Chambers Buildings, Runcorn, for a new General Post Office.

ROMFORD.—The Essex E.C. propose to erect new buildings for the Royal Liberty School at Romford, at a cost of £51,000. Mr. Jno. Stuart, F.R.I.B.A., is the Committee's architect.

SALFORD.—The minutes of the Salford City Council for their meeting contain proposals that two new schools be built.

SHEPHERD'S BUSH.—Sir Philip Cunliffe-Lister, M.P., laid recently the foundation-stone of the large Gaumont Studios which are to be erected at Shepherd's Bush, W., for the production of British cinematograph films by the Gaumont Co.

SOUTH LONDON.—South London Hospital for Women, Clapham Common, has been promised by an anonymous donor £20,000 towards the £180,000 rebuilding scheme, provided that four other similar donations are received by the end of the year. The rebuilding scheme includes a new out-patient department, to take the place of the totally inadequate temporary premises, additional accommodation for nurses, and a new X-ray installation.

ST. ALBANS.—The R.D.C. are to build 20 houses at Wilkins Green, Smallford.

ST. PANCRAS.—Four blocks of flats, consisting of 50 self-contained suites, are being erected on a piece of land in Clarendon Street, N.W. The builders are Messrs. Rowley Bros., Tower Works, West Green, N.15. The flats, which range in size from two to four rooms, with usual offices, have been designed by Mr. A. J. Thomas, F.R.I.B.A., of Queen Anne's Gate, Westminster, S.W.1.

STAMFORD.—The T.C. recently agreed to submit to the M.H. for approval plans for the erection of a further 28 houses of the non-parlour type upon the north-east portion of the New Cross Road housing site.

SWANSEA.—The Corporation are to extend the small-pox hospital at Cwmllwyd, at a cost of £2,650.

TADCASTER.—The Licensing Justices have approved plans submitted by Mr. B. Wilson, architect, High Street, for the erection of a new hotel at Huddersfield Road, Barnsley, estimated to cost about £7,000.

TRAWDEN.—The U.D.C. have approved the lay-out plans for the erection of 24 houses on the Council's housing site.

TWICKENHAM.—The Council is to build 52 houses and 16 tenements on the Colne Lodge estate, at a cost of £38,656.

WANDSWORTH.—Arrangements have been made for commemorating the completion of the 1,000th house erected by Wandsworth B.C. under its housing scheme. The erection of a further 80 houses, at a cost of £537 per house, has been sanctioned by the M.H.

WESTMINSTER.—A building scheme is to be carried out by Messrs. Watney, Combe, Reid & Co., Ltd., brewers, in

No. 1.

The Clay-Pits at Marseilles.

When the Romans invaded ancient Gaul they discovered and quickly realised the wonderful quality of the clay deposit at Marseilles, the supply of which is inexhaustible. The clay extends along the coast for many miles, and its depth is much greater than any other known deposit.

LANGLEY LONDON LIMITED
161 BOROUGH HIGH STREET, LONDON, S.E.1

MARSEILLES
ROOFING — TILES

Princes Street, S.W.1, where it is proposed to pull down, rebuild and enlarge, the old "Phoenix" public-house.

WESTMINSTER.—Among the various plans now being considered by the Governors of the Middlesex Hospital, W.1, are those for the reconstruction of one of the old wards as a children's unit. This would cost a considerable sum, towards which Mr. Bernhard Baron has given £15,000. Mr. A. W. Hall, F.R.I.B.A., Architect, 17 Southampton Street, Strand, W.C.2.

WHISTON.—Lancashire County Council has decided to erect new central and infant schools, at a cost of just over £20,000.

WHITCHURCH.—The U.D.C. have decided to erect 60 more houses of the smaller type, and a provisional agreement has been made for the purchase of land at Highgate.

WORCESTER.—The City Council have decided upon the erection of 118 houses on the Droitwich Road and Checketts Lane housing sites, and to accept a tender of £47,496 for their erection.

Scottish Wages

The Scottish Regional Joint Committee of the building industry, at a meeting in Edinburgh, confirmed their adherence to the national joint agreement, and declared that the attempt of the Scottish Contractors' Association either to increase bricklayers' wages or to decrease the wages of builders' labourers was unwarranted. It was decided that, should it become necessary to take action against the Contractors' Association, every effort should be made to restrict such action, in order that the operations of Federated employers might proceed as smoothly as circumstances permitted, and, in particular, that housing activities should not be interrupted.

A.A.S.T.A. (Metropolitan Division)

Members of the Metropolitan Division of the A.A.S.T.A. recently inspected the Woolwich War Memorial Hospital, Shooter's Hill, now in course of construction. The buildings visited form the first section only, and it consists of four wards of 25 beds each, a maternity unit of eight beds, and two isolation wards. In addition to the administrative offices and central station, there are sunlight and electric therapeutic departments. Two more sections remain to be constructed before the scheme is complete, and when finished the area covered by the hospital and grounds will be 13½ acres. The architects are Messrs. Pite, Son & Fairweather, and the builders Messrs. Foster & Dicksee.

Housing Subsidy

In a recent circular issued by the Scottish Board of Health it is stated, with reference to the use by some contractors of damp-proof courses of inferior quality, that reports continue to be received by the Board from their housing inspectors to the effect that this practice is still prevalent.

more particularly in the case of houses being erected for sale by private enterprise with the assistance of subsidy from local authorities. It is stated that not only is the material used frequently of inferior quality, but also that it is improperly laid. In either case the danger of damp supervening in the houses is very real, and effective remedial measures after a house has been erected are usually impracticable. The quality and laying of damp-proof courses are matters to which the Board attach the greatest possible importance. In order to participate in State subsidy, the materials used must be of good quality, such as is ordinarily specified by a local authority in a contract for working-class houses.

The Board have instructed their inspectors to give particular attention to the provision of damp-proof courses so that State subsidy may not be paid in respect of any house in which they find that the materials and workmanship are not in accordance with the requirements of the Board as set forth herein. It is for the local authority, therefore, if they wish to ensure that State subsidy will not be withheld, to take immediate steps to see that these requirements are fulfilled in all cases.

Edinburgh Housing Exhibition

Mr. E. J. MacRae, A.R.I.B.A., City Architect, in a recent lecture at the Housing and Building Exhibition in the Waverley Market, Edinburgh, spoke on the subject of "Housing the Citizens of Edinburgh."

In the course of his remarks, Mr. MacRae said it was difficult to over-estimate the advantage to be gained by reducing the density of the houses, though it was quite easy to go to extremes in both directions. The Board of Health method of calculating density included the whole area of the ground and the half of the surrounding roads, and on this basis the present standard was 12 houses per acre for cottages, 16 for flats, and 24 for tenements. Measuring on the same standard some of the streets on which tenements were built in the nineties, *i.e.*, within the last 40 years, the density was found to be over 120. The average density of the whole of Greater Edinburgh was 13.1 to the acre. In some of the most congested parts of the Old Town the density was much greater. Much discussion was centred round the question of the tenement house, and there was little doubt that the excessive size and bad planning of old tenements, due to the traditional repetition of old type plans, had brought the pre-war tenement into disrepute. The detachment of view given by the stoppage of building during the war, and the need for reconsidering planning from first principles when housing started again, had been the means of so improving the modern tenement that it could not be considered in any sense unsatisfactory. The number of houses built by the Corporation since the war, and completed, was approximately 2,800, and at present 2,440 were in hand or on

the way, apart from reconstructions in slum areas which were being arranged for, and this gave a total of 5,240 houses, housing a population of something like 26,000 people, about a third of the total population of Edinburgh a century ago. During the present year it was expected that each month fully 120 houses would become ready for occupation, providing accommodation monthly for about 600 people, this year reaching the high water mark of progress since the war. Apart from new housing schemes, a good deal of work had been done in the reconditioning and reconstructing of slum property in position, and the Town Council had a large programme in view for this type of work. It was generally conceded that there was here scope for activity. It was hoped that when the present programme in the Cowgate-Grassmarket area had been completed the general improvement would result in a restoration, to some extent, of the former interest and glory of these historic streets. At the risk of being charged with repetition, he would say again that anything that could be done to remove slum conditions and prevent their recurrence was worthy of all the efforts which Edinburgh citizens could put into this work, and it should be stated that the results already noticeable of new accommodation provided for former slum dwellers had been an immense amelioration of ill-health and a general improvement in the social outlook of those re-housed.

Keighley Experimental Flats

The Keighley Corporation have erected an experimental block of four flats on the Broomhill Housing Estate. These flats, which are now completed, were recently inspected by the Chairman (Mr. W. Bland) and members of the Keighley Corporation Housing Committee, and they are to be opened later in the week for inspection by the public. The four flats are all in one block, two on the ground floor and two above. Each flat is self-contained, and has its own separate entrance. The accommodation consists of a living-room, scullery, bathroom, two bedrooms, pantry, and coal-house. The flat is lighted throughout by electricity. The rent has been fixed at 11s., including rates, but the Chairman of the Housing Committee stated that if a large number of flats were built the rental would, as a result, probably be reduced. The present block of four flats has been built at an approximate cost of £1,600.

If the flats are considered a success, similar flats will probably be erected on the Guard House Estate in West Lane, Keighley, to re-house the people from the Westgate area.

Steel Houses

It has recently been stated that the Scottish Board of Health has decided to invite tenders for the erection of a further thousand steel houses in the industrial areas, where the need of new accommodation is most acute.

REINFORCED CONCRETE ENGINEERS

The Kahn System

An interior of the factory for Wrigley Products, Ltd., at North Wembley, showing mushroom slab construction.

Architects: Wallis Gilbert & Partners.

Contractors: A. Roberts & Co., Ltd.

Reinforced Concrete Engineers: The Trussed Concrete Steel Co., Ltd.

The advantages of mushroom construction for factories.

The illustration on this page shows a typical mushroom construction. The advantages of this system over a beam and slab construction are: the complete elimination of depending beams, resulting in a flat ceiling throughout the building with no obstruction to light or air: the absence of any columns in the external walls greatly facilitates the placing of internal fixtures beneath the windows: one hundred per cent. glass area can be obtained, giving the maximum lighting and ventilation: it is more economical than any other form of construction for large areas.

This system is most suited to modern methods of rapid construction—the bays are all of standard size and the centering can be repeated in any part of the building.

**The essence of the design and construction
of mushroom slab buildings is experience.**

Building Contracts Open

*** It is requested that information concerning Contracts Open, Tenders, etc., be forwarded to Rolls House, 2 Breems Buildings, London, E.C.4, not later than 2 p.m. on Tuesdays. The date given at the beginning of each paragraph is the latest date when the tender or the names of those willing to tender, may be sent in; the name and address at the end is the person from whom quantities, forms of tender, etc., can be obtained.*

ALFORD.—February 25.—For the erection and completion of three pairs of houses on a site in Parsons Lane, Alford. The Surveyor to the Council, Caroline Street, Alford. Deposit £2.

AYRSHIRE.—February 21.—For the erection of a Post Office and Telephone Exchange at Prestwick, Ayrshire. The Architect, H.M. Office of Works, 122 George Street, Edinburgh. Deposit £1 1s.

BOLTON.—February 21.—For the erection of 118 houses intended to be built on the Paulhan Street Estate and 312 houses on the Moorfield Estate. The office of the Housing Department of the Corporation, 51 Victoria Square, Bolton. Deposit £2 2s.

BURY.—February 28.—For the erection and completion of 200 houses of eight types upon land adjoining Hornby Street, and 24 houses of two types in White Street, Buller Street, and Kitchener Street, adjoining the Bolton Road Housing Scheme, all within the borough. Mr. J. Ainsworth Settle, the Borough Engineer, Bank Street, Bury. Deposit £5.

CHAPEL-EN-LE-FRITH.—February 26.—For the erection of 16 non-parlour type houses at Buxton Road, Fernilee. Mr. T. Dinsdale, Inspector and Surveyor, Council Offices, Chapel-en-le-Frith. Deposit £2 2s.

CHESTER.—February 21.—For the erection of 16 parlour type houses on the Handbridge Housing Estate. Mr. Charles Greenwood, Assoc.M.Inst.C.E., Town Hall, Chester. Deposit £3 3s.

CHESTERFIELD.—February 21.—For 68 A3 type and 32 A2 type houses on the Highfield Hall Estate, for the Chesterfield Corporation. Mr. Bailey Deeping, architect, Glumah Gate, Chesterfield, and Messrs. Rollinson & Sons, architects, Corporation Street, Chesterfield. Deposit £1 1s.

COWLEY.—March 1.—For the erection of 436 semi-detached houses, comprising 396 parlour 3-bedroom type, and 40 non-parlour 3-bedroom type on the Bullington Field Housing site, for the Headington R.D.C. Mr. Wm. Page-Webb, architect and surveyor, 23 High Street, New Headington, Oxford. Deposit £3 3s.

DRUMCONDRA.—February 21.—For the proposed additions to St. Columba's National Schools, Iona Road, Drumcondra, for the Very Rev. Fr. Nolan, P.P. Messrs. Morris & Kavanagh, Quantity Surveyors, 68, Harcourt Street, Dublin. Deposit £3 3s.

HORBURY.—For separate trades in connection with the erection of 28 houses in Junction Lane, Horbury. Mr. W. Sugars, Engineer and Surveyor, Town Hall, Horbury.

HINDLEY.—February 28.—For the erection of 24 brick houses in France Street and Margaret Street. Mr. O. P. Abbott, Surveyor, Council Offices, Hindley. Deposit £3 3s.

KIRKBY-IN-ASHFIELD.—February 21.—For the erection of 68 houses of non-parlour type upon the Council's building site. Mr. L. Dodsey, Public Offices, Kirkby-in-Ashfield. Deposit £3 3s.

LEEK.—February 21.—For the erection of 34 non-parlour houses on the Novi Lane Housing Site, Leek. Mr. W. E. Beacham, Surveyor to the Council, Town Hall, Leek.

NORTH BERWICK.—February 24.—For the following works: Mason and brickwork, slater and roughcast work, plumber work, carpenter and joiner work, plaster work, fences and gates, painter work, in connection with the erection of four blocks of 3-apartment houses and four blocks of 4-apartment houses at Lochbridge Road, North Berwick. Mr. A. Robertson, Burgh Surveyor, North Berwick.

ROCHFORD.—February 26.—For the erection of a new block of buildings at Rochford, for the Rochford Guardians. Contract Guarantee Bond. Mr. Norman Evans, L.R.I.B.A., 41 High Street, Southend. Deposit £1 1s.

SLIGO.—February 28.—For building a new Parochial Hall at John Street, Sligo. Hon. Secretary, Mr. J. Blennerhassett, Lower Knox Street, Sligo.

SOUTHMOLTON.—February 21.—For the erection of 12 non-parlour type houses on a site in Mill Lane. Mr. G. K. Foster, Borough Surveyor, Town Hall, Southmolton. Deposit £2 2s.

SOUTH STONEHAM.—February 21.—For the erection of 64 non-parlour houses. The work is divided into sections, as follows: Section 1, five blocks of four and one of two houses; section 2, five blocks of four and one of two houses; section 3, five blocks of four houses. Mr. W. R. Cowell, "Fernlea," Hedge End, Hants. Deposit £2 2s.

STALYBRIDGE.—For the erection of 106, or a smaller number, of non-parlour houses (two types), on land between Ridge Hill Lane and New St. George's Church, The Hague, Stalybridge. J. N. White, Borough Surveyor's Office, Town Hall, Stalybridge. Deposit £2 2s.

STEEPLE BUMPSTEAD.—March 3.—For the erection of three pairs of non-parlour type cottages and two pairs of parlour type cottages, in the parish of Steeple Bumpstead. Mr. H. Brown Thake, 10 High Street, Haverhill.

SUTTON-IN-ASHFIELD.—February 25.—For the erection and completion of 100 dwelling-houses, parlour and non-parlour types, to be erected in pairs and blocks of four.

(1) Central Section, 36 houses; (2) Northern and Western Boundaries Section, 42 houses; (3) Southern Section, 22 houses; (4) Roads, pavements and sewers. Messrs. Warner & Bock, Architects and Surveyors, Mansfield Road, Sutton-in-Ashfield. Deposit £3 3s.

The College of Estate Management

The session of Special Post Graduate Lectures at the College of Estate Management, Lincoln's Inn Fields, came to an end recently, when Mr. Sydney A. Smith gave his second lecture, and dealt with the valuations of factories and flats. Mr. Smith said that in the first consideration in the case of a factory was position, and in respect to position the most important thing was the vicinity of labour, skilled or unskilled, according to requirements. If there was not ample labour in the neighbourhood, a newly-established factory had to build its own houses for its work-people, which was a costly procedure and earned only a small return, although, of course, on the other hand good housing meant a contented staff. A factory must also be situated in a place where adequate power was available, which in this country was coal, and must have access to gas and electricity supplies. Another great desideratum was that the factory should be in the neighbourhood in which its own raw materials were found—a beet sugar factory, for instance, should be near where beet was grown. Water supply was another important consideration in many manufactures, though it did not follow that a works which had a river frontage could take up unlimited water from the river for nothing: some firms paid rather heavily for this privilege. Flats, again, were valued in the same way as other property. It was a problem simply of finding the net rent and multiplying it by a number of years' purchase. In the case of flats, the matter was relatively simple because, as a rule, there was only one class of purchaser of a block of flats, namely, the investor. Mr. Smith indicated the various outgoings which had to be borne in mind in the upkeep of a block of flats, and how planning was of greater importance in the case of flats than in almost any other property. Situation also was important, and the kind of aspect from the windows had to be regarded. It was a serious drawback to a flat if most of the windows looked out upon a wall between blocks. If there was a passenger lift, practically all the flats above the ground floor carried the same rental; if there was not a lift, the first floor carried the highest rental, and above that each floor might be considered approximately 10 per cent. less than the floor immediately below. Flats were very expensive to build, and rather difficult to finance in buildings. The valuer had to try to get down to a fair average rent, and one which was likely to be maintained in future, as the basis of his valuation.

YORK.—The Corporation Housing Committee recommend the tender, £35,712, of Mr. A. V. Clerey, of Sunderland, for the erection of 42 houses on the Tang Hall Estate.

Sadler's Wells Theatre

Work is shortly to be commenced on the conversion of the Sadler's Wells Theatre in Rosebery Avenue, E.C.1, into an "Old Vic." for North London. It is hoped to commence the structural alterations and the provision of a new roof, advised by the architects, Messrs. Frank Matcham & Co., 9 Warwick Court, High Holborn, W.C., by April or May next. The cost is estimated at about £60,000.

Demolition is now complete on the final section of the premises of Messrs. Bourne & Hollingsworth, in Oxford Street and Berners Street, W.1. The foundation works are now being constructed by Messrs. F. G. Minter, Ltd., Ferry Works, Putney, S.W.15, whilst the steel framework will be put in hand by Messrs. Dorman Long & Co., Ltd., Central Buildings, Westminster, S.W.1. Messrs. Slater & Moberley, A. and F.R.I.B.A., architects, 46 Berners Street, W.1.

Four European Fairs

Within the next few weeks four European nations will be holding commercial and industrial fairs. Great Britain leads off with fairs in London and Birmingham simultaneously. These open on February 21 and continue until March 4. Leipzig Fair opens on March 6, and the Fair at Vienna opens a week later, March 13, and continues till March 19. The fourth, the Basle Fair, opens for ten days, on April 2.

Official Publications

The British Engineering Standards Association have recently issued a Specification for Switchgear Cells and Cubicles constructed of moulded stone. (B.S. Specification No. 268-1926). The Specification is divided into two parts indicating the principles to be followed in the construction of (1) Cubicles constructed from pre-cast units; (2) Cubicles constructed in place. Copies of this new B.S. Specification may be obtained from the B.E.S.A. Publications Department, 28 Victoria Street, S.W.1. Price 2s. 2d. post free.

Northern Housing Conference

Delegates of rural district councils in Lancashire, Cheshire, and the North generally, will attend a Manchester conference in the Memorial Hall, on March 3, arranged by the National Housing and Town Planning Council. The chief subjects will be rural housing and the provisions of the Housing (Rural Workers) Act. Prof. Patrick

Abererombie, of Liverpool University, will describe the work of the recently formed Council for the Preservation of Rural England.

Professional Note

The firm of Gall & Hay, architects and surveyors, 177 Union Street, Aberdeen, of which Mr. Robert Robb Gall, F.R.I.B.A., and Mr. George Morrison Hay, L.R.I.B.A., are the only partners, has been dissolved by mutual consent. In future, Mr. Hay and Mr. Gall are to carry on business separately on their own individual accounts—in the meantime at the same address.

Change of Address

Messrs. G. E. Wallis & Sons, Ltd., announce that on and from January 1 their address will be Medway House, 11 and 12, Old Cavendish Street, W.1. Telephone No.: Mayfair 3614 (3 lines).

Trade Notes

Betonac Steel Concrete

There has recently been put on the market a new metallic aggregate called Betonac. It consists of particles of pure steel, scientifically graded for use with cement as a matrix. As no stone can equal the harder metals in durability, it follows that there can be no more durable concrete than that made with the new aggregate. In fact tests, it is claimed, have shown this to be the case, and the makers of Betonac recently published a pamphlet describing the results of experiments made with the new aggregate by the National Physical Laboratory.

New Architectural Books

We have received from Messrs. B. T. Batsford, Ltd., a copy of their new catalogue, which has just been put into circulation. It contains descriptions of over 480 books on Architecture, Building, Engineering, Applied Science, Art, Social Life, Furniture, Decoration, Handicrafts, etc.; and in addition there are 32 pages of photographic illustrations taken from the books.

Trade Catalogues Received

The National Gas Engine Co., Ltd., Ashton-under-Lyne. A new catalogue (No. 251B.), dealing with National Horizontal Heavy Oil Engines.

Swedish General Electric, Ltd., 5, Chancery Lane, London, W.C.2. A new Price List, No. A.30, describing the well-known "Century" single phase repulsion induction motor, which is constructed for all frequencies between 25 and 100 cycles, and in various sizes between ½ and 40 h.p.

The British Thomson-Houston Co., Ltd., have just published a miniature edition of their catalogue of B.T.H. Electric Wiring Supplies and Domestic Appliances. Except for its size, this new edition, which measures 6½ in. by 4½ in., is an exact replica of the 120 page catalogue published a few weeks ago.

Hans Renold, Ltd., Manchester. This little leaflet, "The Power of the Press," has been specially compiled for the printing trade, and concise reasons are given as to why chain as a power of transmission should be used in a printing factory.

EXPANSION IN STEEL CONCRETE

The cohesion of Betonac Steel Concrete is permanent. Betonac, the new metallic aggregate, possesses the same coefficient of expansion as the mix of which it forms part and the same vital bonding characteristics as the steel reinforcing rods in Reinforced Concrete. Betonac gives the strength of steel to concrete; it is waterproof, and practically dustless; it is durable, non-skid and impervious to frost. Lay Betonac Steel Concrete for all wearing surfaces. Send for samples, prices and copy of National Physical Laboratory Tests.

BETONAC STEEL CONCRETE

FRANCOIS CEMENTATION COMPANY, LTD
Betonac Department, 5 Bentley
Works, Doncaster.

LAFARGE WHITE PORTLAND CEMENT

An example of Artificial Stone in Lafarge White Cement.

Delivered ex London Stock by

THE ROM RIVER CO., LTD.,
7 WHARF, AMBERLEY ROAD, PADDINGTON, W.9
Telephone: PADDINGTON 2192

When it is possible to produce better cement than "Kaye's" Portland Cement, we shall be the first to make it. Are you using "Kaye's," one of the oldest British Portland Cements?

KAYE'S PORTLAND CEMENT

To builders requiring an efficient binding material which costs less than Portland Cement, we recommend "Kaye's" BLUE LIAS LIME, prepared from the beds of the Lower Lias formation. Write to:—

KAYE & CO., LTD., Southam Works, nr. Rugby
Stocks: BIRMINGHAM, MANCHESTER, NOTTINGHAM, COVENTRY,
LEICESTER, STOKE-ON-TRENT.

H & C WROUGHT STEEL VENTILATORS

YEARS of experience in the manufacture of Ventilators made from Wrought Steel have resulted in many and important improvements being effected, chief of which is increased capacity for the free transmission of air. We have reduced the area of fretwork obstruction and thereby largely increased the size of openings in our Ventilator faces, with added strength.

The air capacity of H. & C. faces will be supplied on request, together with sizes of Ventilators stocked. Made of heavy gauge steel to ensure rigidity and durability. Of all Ironmongers and Builders' Merchants.

Wm. E. PECK & CO. of London Inc.,
31, Bartholomew Close, LONDON, E.C.1

CURRENT MEASURED RATES.

[COPYRIGHT.]

These Prices apply to a New Building, costing from £1,000 upwards, in the London Area. They hold 10 per cent. in excess of the actual prime cost, without Establishment Charges.

PRELIMINARIES.

Allow for General Foreman, according to nature of contract, for duration of contract	From £5 10s. per week.
Allow for Workmen's Compensation and Public Health Acts over whole amount of general building contract	1%
Allow for insurance against fire, ditto	1%
Allow for water, ditto	1%
Allow for District Surveyor's Fees	
For a new building 400 square feet in area and two storeys high	45/-
Add for every additional 100 feet in area	3/9
Add for every additional storey in height	7/6
Add for inspection of fire exits, &c., under Amendment Act, 1905—the greater of these alternatives	1/4th of the above fees or £1 1s.
Allow for supervision of plastering	7/6
Allow for filling in trenches within three feet of a building	7/6
Allow for licences in respect of hoardings, &c., within the City of London, as Regulations	say £10
Ditto, for licences from Borough Councils	say £1
Allow for mess and material sheds, offices, &c.	from £50
Hoardings complete	Per Foot Run 5/-
Planked gangway with handrail complete	4/-
Proper gantry complete	40/-
Sleeper roadways	8/-
Needling strutting or shoring, including all labours and use and waste in erection and removal	Per Foot Cube 5/-
DEMOLITION	
Pull down brickwork	Per Ft. Super reduced quantities 6d.
Add, if in very small quantities not exceeding 21 ft. out to carts	3d.
Add for filling baskets with debris and running same	1 1/2d. 1 1/2d.
Add if debris has to be raised or lowered to ground level	2d. Usually dropped
Add for cartage when same costs 4/6 per 1 1/2 yard load	2 1/2d. 2 1/2d.
Clean and stack old bricks	20/- per thousand
Hack off old plaster	1/- per sq. yd.

EXCAVATOR, CONCRETOR AND DRAINS.

Excavate in common soil, wheel, fill carts and cart away	Per Yard Cube		
	5 ft. deep	5 ft. to 10 ft. deep	Add if in trench
Planking and strutting	9/6	11/-	9d.
Planking, strutting and shoring	4d. per foot super.	1/-	" "
Portland cement and ballast Concrete in foundations	1 to 6	1. 2. 4.	Holsting
	29/6	36/6	2/6
	2/-	2/10	2/6
Add if in ground floors	3/-	4/-	2/6
Add if in beams or lintels			
Tested stoneware drains jointed in cement or standard iron drains jointed in lead, per foot run	Earthenware		Iron
	4 in.	6 in.	4 in. 6 in.
Extra only for bends, each	2/-	3/-	3/- 4/6
Ditto for junctions, each	2/6	3/6	11/6 20/-
Gullies, including concrete surround and iron grating, each	3/-	4/3	19/- 35/-
	16/-	18/6	35/- 50/-

BRICKWORK (Exclusive of Pointing).

Built in 1 to 3 lime mortar	Per Rod Reduced		
	Flettons	Stocks	Blues
" " cement mortar	616/-	821/-	1055/-
	636/-	841/-	1075/-
Damp course	Per Foot Super		
	Horizontal	Vertical	
Two courses of slates in cement	10d.	1/3	
1-in. asphalt	9d.	1/-	
Facings	Per Foot Super		
	Flemish bond	English bond	
Allow for every 5s. additional cost of the facing bricks over the common brick basis	1d.	1d. plus 10%	
Pointing (exclusive of scaffolding)		Per Ft. Super	
Weather joint in cement		2 1/2d.	
Flat joint in cement (struck) and lime whitening		1 1/2d.	

ARCHES.

Extra over common brickwork	Per Ft. Super
In half-brick rings of bricks of same class as common brickwork	1/-
Add if of superior bricks for every 7/6 per thousand additional cost	1d.
In rubbed and gauged arches with fine joints	1d.
Quoins, angles, copings and sills of superior bricks	6/-
Allow for every 5s. per thousand additional cost of bricks over the common basis price	1d. plus 10%
Double-tile creasing and cement fillets and pointing to 9-in. wall	1/2

PAVING.

Cement and sand	1 in.	1 1/2 in.	1 1/2 in.	2 in.	3 in.
	3/-	3/5	3/10	4/8	5/4
	4/2	4/9	5/3	6/4	7/4

Deal plain-edged flooring	33/-	40/-	50/-
Deal tongued and grooved flooring	37/-	45/-	56/-
Deal matching	36/-	43/-	53/-
Sashes, per foot super			
Deal moulded sashes, divided in squares		1 1/2 in.	2 in.
		1/10	2/-
Windows, per foot super			
Deal cased frames, 1-in. linings, 1 1/2-in. pulley styles, 2-in. sashes in squares, oak sill, double hung with pulleys, lines and weights	Very small	Small	Normal
	11/-	5/-	3/6
			3/-
Doors, per foot super			
Square frame both sides doors	2 in.	4 in.	6 in.
Add for each side moulded	2/-	2/3	2/5
Add for each side bead butt	2 1/2d.	3 1/2d.	4 1/2d.
	4d.	4d.	5d.
Doors of hardwood such as oak or mahogany, will cost three times as much exclusive of polishing.			
Staircase.			
1 1/2-in. Deal tread, 1-in. riser, fixed complete per foot super			2/6
2-in. Deal strings, per foot super			2/-
Housing steps to strings, each			9d.

"MURAPRIME"

"JAPOLITE"

"MURALINE"

THE PERFECT WATER PAINT

Sanitary, Artistic, Durable. Requires only the addition of water to make ready for use. In 40 shades. Sold in a dry powder.

THE PRIMING FOR MURALINE

and all washable water paints and distempers. Also for use over wallpapers to fix colours before applying distemper, and to prevent absorption.

THE PERFECT JAPAN WHITE

Elastic, Brilliant, and Durable. Flows evenly and is unequalled for the very highest class decoration. Made in White, Ivory White, and Blue White.

THE CELEBRATED WHITE UNDERCOATING

One Coat transforms Black into White. Ready for use in five minutes.

PURE LIQUID PAINT

NON-POISONOUS AND READY FOR USE

Specially manufactured for the finest Interior and Exterior Decoration. Extensively used by Corporations, District Councils and Unions throughout the United Kingdom.

HARD GLOSS FINISHING PAINT

Specially prepared to dry with a Hard, Glossy Surface in about 8 hours. Suitable for all Exterior and Interior Work.

"VITROLITE"

THE GREENHOUSE AND DECORATIVE WHITE PAINT

Superior to white lead in colour, covering power, and durability. For all Interior and Exterior Work. Specially suitable for Greenhouse Work.

Patterns, Prices, and Full Particulars of above and other Specialities on application to:—

SETBACKS AND DRAWBACKS

Of recent years, British Architects have devoted considerable attention to the doings of their professional brothers on the other side of the "herring-pond." It would be hard to say exactly when this native curiosity anent the achievements of the American Architects became manifest. No doubt there was a preliminary era of travellers' tales, all drawing attention to the quality of building work being done in the United States; but the culminating point of interest came when the Royal Institute staged, some years ago, a rather remarkable exhibition of American architecture, representing the fine flower of the work of the preceding twenty years. That Exhibition left us all a little breathless and most of us just a little unbalanced on the subject. Later, when the spell had worn off a little, our critical faculties began to wake up and reassert themselves. At that time, the column, with its pedestal and decorated cap, had set a conventional motif for the skyscraper, just as Colchester Town Hall, in an earlier decade, had set the "decorated chimney shaft" motif for the towers of municipal buildings over here. The interest in American work, particularly the skyscraper thus created, has never entirely ceased, and lately has been intensified by the problem of treating this class of building under the limitations of the new zoning laws. Mr. Howard Robertson's article in this issue deals with some aspects of the employment of setbacks or recessed planes in the new skyscraper, by which the American designer, in complying with the inhibitions of the new legislation, has achieved "a sort of pyramidal massing which has the elements of powerful and dramatic composition." One cannot but admire the manner in which the restrictions have served as the mould for casting a new motif in composition. The effect anticipated here, of zoning limiting height does not seem to have been realised, and there would seem to be no tangible limit in that respect "except the sky," although ever increasing height means an ever increasing sterilization of floor space for necessary "services," so that one can reach a point where the services take up more space than the usable area.

Setbacks, however, are not so new a factor in design as recent American developments might lead us to imagine. We have had them over here for generations, although, in our case, "drawbacks"

would be a more apt description. Here, the setback is not the logical outcome of designing in compliance with certain clear legislative restrictions; more generally it proceeds from the enforced marring of a design to escape the possible penalties of laws lacking in clarity and seldom logical. It is a fortuitous circumstance that has drawn to our pages, in the same week, both Mr. Robertson's consideration of the American recessed plane, and another valued contributor's essay on troublesome light and air problems in London; but one cannot refrain from drawing the moral when these two contributions are juxtaposed. Indeed, we reinforce it by some notes of a legal contributor on the present legal aspect of rights of light, which are at one and the same time, the bugbear of the architect and his client, and mainly responsible, in London buildings, for queer forms of which we give some illustrations. The "Queen Anne" front and the "Mary Ann" back is an old score at the expense of the speculative-built house; but while there may be sound reasons, as our contributor adduces, for treating the back of an important block on less lavish lines than its street front, our sympathies must necessarily be with the architect who, having designed a fine building with an imposing front, is compelled, by force of legal circumstances, to finish off the back like a lean-to-shed. It is not merely the injury to the design but the very considerable loss in which a building owner may be involved by the wholesale curtailment of his upper floor areas. In these days of high ground rents and site values in civic areas, the uncertainties of legislation may prove a very serious hindrance to building enterprise. For the law, or its interpretation, in regard to rights of light, has been considerably modified in our time. Formerly, it was merely a question of angles; prove that some new building had diminished the angle of light that erstwhile reached your premises and you were assured of satisfaction and damages. To-day, one must prove that the diminution of light seriously interferes with the use and enjoyment of a building; and the determination of that fact opens up all kinds of opportunities for hard swearing and uncertain decision. And it may safely be said that for every claim made with some reasonable justification, two are put forward which may be described as bluff; attempts to wring compensation out of a

building owner or to secure alterations in his design, or in the building itself, which the Court would not uphold or enforce if the claim were put to the test. One such case has come to our notice within the past few weeks. In addition to the worry and annoyance, possibly the holding-up or hindrance of building operations, the building owner is involved in legal expenses in resisting the demands made.

And that brings us to the moral of this business. The American architect has to deal with setbacks,

clearly defined by his existing regulations; his British confrere is beset with drawbacks which he has no power of determining. Has not the time come to set them both on an equal footing? Have we not reached a time, in this twentieth century, when the English laws in regard to rights of light and air affecting buildings should be so clearly defined and stabilized that the building-owner and, his architect can determine the possibilities of a site and its utility for their purpose, before they are committed to building upon it!

Notes and Comments

The London Bridge

The London County Council deputation met the Prime Minister last Friday without, as far as we can discover, any tangible result. Each side was out, apparently, to discover what the other intended to do in the matter of the Royal Commission's recommendations. The Council wanted to know, chiefly, whether the Government will foot the bill, but Mr. Baldwin preserved a discreet silence. In this matter we cannot do better than re-echo the opinion of *The Observer* that "the needs of the modern metropolitan area are, in truth, too far-reaching to be met by any initiative short of the Government's own. As regards policy and method, the Report has had, in racing parlance, a walk-over. Apart from matters of detail, the response of public opinion has been overwhelmingly favourable." Indeed, to mark its sense of the excellent work and far-sighted proposals of the Commission, the Architecture Club is giving the Commissioners a complimentary dinner, which will take place at the Savoy Hotel on March 22.

Registration

Speaking at the recent dinner of the Nottingham and Derby Architectural Society, Mr. A. J. Bennett, M.P., voiced his support of the Architects' Registration Bill, against the principles of which he had heard no opposition, and the only objections concerned details. The A.A.S.T.A., in a letter we publish in this issue, raise one or two points of detail, more particularly the exact definition of "Architectural Assistant." We agree that the term should be strictly defined and limited to those doing technical designing. Matters are very loosely conducted in some architects' offices. We have known cases where purely clerical assistants, without any æsthetic training whatever, have, in process of time, blossomed out into full-blown practitioners simply through a certain facility in picking up the details of architectural practice. Now while this may betoken capacity of a sort, it is not the kind of ability that registration should foster. British architecture to-day is weakest in regard to design, and the aim of any Registration Bill should necessarily be to ensure that future entrants to the profession have demonstrated their abilities in this, the most important side of their art. If the question were not so serious, the letter of Mr. Geoffrey Butler, M.P., to *The Times*, would be humorous. He pleads that the R.I.B.A. should not press forward with their Registration Bill as it now stands; thinks it possible that "they will be able to get a good deal of what they want by agreement with representative organisations if they care to spend the time and take the trouble to try." Well, the R.I.B.A. has spent thirty years over the matter. How much longer does Mr. Butler suggest the Institute should wait, and what other organisation is there which is representative of architects in this country? If registration is further delayed, we can foresee a crop of mushroom societies arising whose main object will be to force official recognition for men devoid of

qualifications for the profession. Apparently the University of Cambridge is perturbed about its School, though why this fear should arise in the case of an institution recognised by the R.I.B.A., and headed by a distinguished Fellow of the Institute, we find it difficult to conjecture.

London Housing Schemes

The L.C.C. Housing Committee has begun to take stock of its housing commitments, and has decided not to acquire further land for housing schemes in relief of south-eastern districts. The statistics show, apparently, that the Metropolitan boroughs constituting the south-east part of London are not suffering from housing pressure to such an extent as those more centrally situated. The development of the Bellingham Estate, which was one of those purchased to relieve housing shortage in the south-east, has been completed by the erection of 2,000 houses; on the Downham Estate, the other property acquired for a similar purpose, 3,500 houses, of the 6,000 in all to be built, have also been completed. For this part of London the Committee thinks the Council has now done sufficient, particularly as the Borough Councils of Woolwich, Greenwich and Lewisham have carried out smaller housing schemes in their own districts. The principal drawback to the development of outer London on this side has, in the past, been the indifferent train service, and until this has been remedied it is doubtful whether private enterprise will now step in to supplement the work already carried out by the Council.

Bloomsbury

It is said that general cheers greeted the announcement in the House of Commons that the Bill to authorise the transfer of Covent Garden Market to the Foundling Hospital Estate had been withdrawn. Its promoters have rather wisely bowed to the growing storm of disapproval, and there is little doubt that the opposition of the Westminster City Council, and the destructive criticism of the whole basis of the market by the Council's Clerk, Sir John Hunt, was the deciding factor in their decision. We are not inclined, however, to join in the general chorus about Bloomsbury's salvation which the withdrawal of the Bill seems to imply to most of our contemporaries. Mrs. Cecil Chesterton, the Hon. Secretary of the Foundling Estate Protection Association, very wisely endeavoured to stem the prevailing view that all is now well. The Foundling Estate has been saved from one evil fate, but there is no saying that another will not be quickly threatening. The property was bought as a speculation, and, no doubt, one profitable realisation has been thwarted by force of public opinion. The owners will now be forced to consider other ways of dealing with it, and those that offer may be as bad, or even worse, than the Covent Garden proposal, so that vigilance must not be relaxed.

The fifth and concluding article on "C. F. Annesley Voysey" will be published in our next issue.

WESLEYAN CENTRAL HALL, WESTMINSTER.
MESSRS. LANCHESTER & RICKARDS, Architects.

SOME LONDON PROBLEMS OF LIGHT AND VENTILATION

In many of our great towns, and in the City of London in particular, the difficulty of giving office rooms a sufficiency of light and ventilation is so great that many commercial firms, in their choice of premises, put these desiderata first of all, and if only they can obtain fairly bright and cheerful rooms they are quite willing to sacrifice architecture, or at least to relegate it to a quite subordinate place in their thoughts. This attitude of mind is not an unnatural one, for after all the health of human beings is far more important than architectural beauty.

In the City of London some of the most successful architects are those who show a special aptitude for devising means of lighting and ventilating rooms in the most unpromising positions, where, in fact, it would appear at first sight that the occupants of the building must be for ever doomed to live in comparative darkness. It is, however, nothing new that architects should be compelled to exercise their in-

enuity in such a fashion, for some of the greatest practitioners have not disdained to give considerable attention to this problem, which is of especial urgency in a city like London, where the sky is not only frequently obscured by clouds, but also by smoke and fog. It may be remembered that Sir John Soane, in his Bank of England and elsewhere, showed himself to be a great master of the art and science of planning for light and ventilation, but in his case, being not only a practical man but an artist of genius, he succeeded in attaining his utilitarian object without sacrificing the æsthetic qualities of his designs. For instance, in the house in Lincoln's Inn Fields where he himself resided, it is noteworthy that although the site was a restricted one, he was able by his clever devices of top lighting and "top side lighting" to provide ample illumination for his extensive collection of pictures and other objects of interest. In the Bank of England, also, although the outside of the building

NEW PREMISES FOR THE *DAILY MIRROR*, ROLLS BUILDINGS, FETTER LANE.

MESSRS. H. O. ELLIS & CLARKE, Architects.

assumed the form of a screen wall almost entirely unfenestrated, he yet succeeded, by means of a number of interior courts and ceiling lights, to render the building unusually well lit. Many modern designers of city buildings could obtain useful hints from the plans and sections of the old Bank of England, of which the interior has now, however, been sacrificed owing to the need of erecting a taller building on the site. Every part of the old Bank of England was attractive to look at, there were no untidy back elevations, every courtyard was itself a studied work of art, which shows that where the will and capacity are present it is possible even on a difficult site simultaneously to satisfy the demands both of hygiene and æsthetics. Yet although it is right to set before ourselves such a high standard of architectural accomplishment, we may readily admit that there are occasions when we must put up with the second best, when we must content ourselves with achieving a result which cannot be said to be beautiful, but which nevertheless has a certain tidiness in itself commendable. And especially must we be satisfied with this limited architectural ambition when we are dealing with tall buildings which have plenty of space in front of their elevations towards the street, but which at their rear must needs have their form modified in order to respect the privileges of ancient lights which are the legal prerogative of the buildings behind them. Such a case in point is Africa House, in Kingsway, where an imposing front façade is maintained for a certain distance at the side elevations, but is then obliged to be cut away to indicate the profile of a great sloping roof through which light is admitted by means of an orderly array of flat-roofed dormers. It is difficult to see what other solution could have been adopted if we assume that the site must be built upon to its utmost capacity. Moreover, it must be borne in mind that in this instance the rear of the building does not abut upon an important street, but a narrow thoroughfare which may justly be described as a lane. A building so situated is entitled to have a rear elevation characterised by a state of architectural "undress." Indeed it is an important means of architectural expression

that the back of a building should be markedly different from the front, not different necessarily in style, but in its status. One may say that the degree of dignity here suitable is less than what should distinguish the front, for the street itself gains in architectural worth if the buildings aligned upon it express in their principal façades a degree of order, coherence, and decorative elaboration which are not to be found in those parts of the building that look away from the street.

A solution similar to that adopted in Africa House is exemplified in the *Daily Mirror* building to the north of the Record Office, where the architects were obliged to deal with an exceptionally difficult site. In this case the wall has been stepped back with a series of sloping roofs, each with its row of dormers. There can be no doubt that by this treatment the building has not only been carried up to the maximum height permitted by the bye-laws, but it has been provided with the maximum amount of light and ventilation which the circumstances permit. In this case, also, the façade here presented has some of the characteristics of a rear elevation, except that it must be noted that to the left of the picture is the tower of the Record Office, which seems a little incongruous when seen in juxtaposition with the receding roofs of the new structure. It so happens that this particular view can be seen by comparatively few people, and, in fact, is likely to trouble none but the occupants of a neighbouring building. But, nevertheless, one cannot help asking one's self whether it is at all possible to give to the elevations, so ingeniously contrived to catch the sunlight, a more dignified architectural appearance. In the United States of America the new zoning regulations have resulted in a type of architecture not without artistic merit, but it will be observed that the buildings are there in most instances given setbacks of rectangular section, and we do not see a miscellany of sloping roofs having little or no æsthetic relationship to the building as a whole. Nobody is entitled to ask the impossible from architects, yet the convention might well be established that while the back of a building may legitimately show a less highly organised composition than the front, inasmuch as it can generally be seen

NEW OFFICE BUILDINGS IN BLOMFIELD STREET, LONDON, E.C.
MESSRS. M. E. COLLINS & SON, Architects.

from some parts of the public thoroughfare, and invariably by the occupants of the buildings facing them, an attempt should be made to give them, if not beauty, at least a measure of architectural decency.

Another building here illustrated, an office block designed by Messrs. M. E. Collins & Sons, has its principal façade on Blomfield Street, near Finsbury Circus, and it shows a different method of making provision for sunlight in a difficult site. In this instance, where the building abuts upon a side street, part of the façade is set back. Here, however, the setback has been achieved with a certain amount of architectural ceremony, and there is no doubt that this side elevation is every bit as interesting as the principal façade facing Blomfield Street. It is noteworthy that a clever use has been made of curved bays, which form graceful transitions between the planes of the wall surfaces at the places where these latter would otherwise conflict. This building may be compared favourably with certain others one might mention in which the setback, instead of being placed in a side street where it is comparatively inconspicuous, is

deliberately put in the front elevation with the express object of dissociating this from its neighbours, and thus giving it as much architectural prominence as possible. This new office block is a distinguished design which accords well with the neighbouring buildings, and is a notable addition to the architecture amenity of the district where it is situated.

While occasionally the attempt to provide buildings with adequate light and ventilation may lead to interesting and even attractive architectural results, it must be confessed that more often considerations of economy stand in the way of an æsthetic solution of the problem presented. Some especially unhappy consequences have resulted from the rigid enforcement of the laws which have to do with ancient lights. Perhaps the most notorious example of this is to be seen in the Central Hall, Westminster, where the elegant stone cupolas designed by Mr. H. V. Lanchester and his late partner, Mr. A. E. Rickards, had to be sacrificed in order that Westminster Hospital might receive its full share of light.

THE ARCHITECTURAL ASSOCIATION

Architecture in America

Mr. T. Alan Slater (President) occupied the chair at a general meeting of the Architectural Association on Monday evening at 35 Bedford Square, W.C.1. Seven new members were elected as follows: A. E. Barnard, W. Hirst, H. J. Franklin, Miss M. Raemaekers, K. H. McConnel, B. Ionides, and C. W. Neil.

Mr. Howard Robertson, F.R.I.B.A., then gave an informal talk, illustrated by lantern slides, on "Architecture in the United States." In the course of his remarks, Mr. Robertson said to attempt to understand American architecture one must know the country and the American mode of life. North America is so vast that it allows for every sort of climatic condition, and this vastness, coupled with the mixture of races, has compelled a certain standardisation in the production of the essentials of existence, including buildings; but at the same time climate makes for local variation in the architectural expression. Quantity production has given to American architecture a particular character. There is little time for individual personal touches, and every effort is directed towards the rapid design and erection of large buildings, the details of which are often of a standardised type.

The remarkable characteristic of modern American architecture, which has developed in the last fifty years, is the generally high level in both domestic and public buildings, the boldness with which technical problems are solved, and the failure of the architectural detail to keep pace with the fine simple massing which characterises much of the bigger work. The large scale of American buildings is of assistance to the designer, for with their big masses it is almost impossible to fail to be impressive, despite poor or commonplace detail. American domestic work, said Mr. Robertson, is a most interesting field, but except in the important matter of comfort and equipment, we have little to learn. The most noteworthy contribution of America to modern architecture has been in the solution of her own particular problems—buildings for commerce, for transportation, for dwelling. The problems of every American city are different, but they all have one factor in common: the congestion in the business and favourite residential quarters, with the result that the skyscraper is introduced as a palliative. Therefore the skyscraper, though specially associated with New York, is a national asset—or liability.

American commercial buildings, banks, offices, warehouses, are efficiently, even luxuriously, designed as a setting for this national occupation. Money largely replaces aristocracy, hence the magnificence of business premises. The banks are temples, as they are beginning to be in this country. Transportation has called into being magnificent terminal stations for the railroads, and these will soon be followed by the development of road and garage service for automobiles. The American garages are ahead of any in Europe.

But the greatest American contribution to the architecture of the home is the apartment house and apartment hotel. They are the normal outcome of the American mode of living. The new hotels are always full, and by the time they have lost popularity they can be pulled down, for the investment life of one of these buildings does not exceed eight or ten years. Zoning has produced fine silhouettes, and American tall buildings are becoming modern in expression, but lower buildings retain a classic flavour. The detail of most American buildings is well placed

and in good scale, but it is very dull and trite, being nearly always borrowed direct from some European source. There is very little use of colour, and the streets are more drab than those of London, due to the neutral tones of brick and the lack of strong colour accents. Interiors are generally based on Spanish, Italian or French tradition, sometimes English or German. They are often the work of professional decorators, well executed, but lifeless and without character. Interiors of banks, hotels, restaurants, theatres, all resemble each other. Modern decoration is just beginning to be acceptable, but is naturally opposed by the decorators who sell antiques. Gothic architecture is in favour for churches, schools and suburban apartment houses. The American commercial use of Gothic, with a few exceptions, results in the creation of a permanent distaste for anything mediæval.

It would be a great mistake, concluded Mr. Robertson, to base our architecture on American models, any more than on that of any European country. America's achievement is the solution of her own problems, but she has borrowed largely from Europe in so doing; we must not attempt to borrow back her borrowings. We can learn from America the better organisation of builders and the architect's business, the mechanical equipment and perfection of all services, and the power and will to do things in a large way. In England we are apt to be petty, even our war memorials have sometimes to tell the hour. We can learn from Americans a broader habit of mind, but we must work out for ourselves our national architectural expression.

In proposing the vote of thanks, Mr. Alfred Bossom said American architecture was not perfect, and American architects knew it. In less than twenty years three styles of architecture had developed in America: every building was a new experiment and a change from the one before. A style of architecture could not be built up in thirty years. The American architect, while appreciating Mr. Robertson's remarks, would not agree with several of his comments; but Americans, for their part, were equally critical of the English. American detail was often copied because, from sheer economical necessity, the American architect had often to get such a tremendous hustle on the job. The interests of American and English architects depended on a friendly attitude towards each other, and for this end it was essential they should both appreciate criticism of each other.

In the ensuing discussion, Mr. Lionel Pearson said sunshine helped architecture more than they usually realised, and personally he had the greatest enthusiasm for American architecture: buildings in New York were very simple—a much greater simplicity in their work than in this country. They had dropped the cornice and had little time to surround their windows with architraves, which was important, considering the number of their windows. With regard to the detail of American architecture, the work of Platt and Harmon showed an extraordinary refinement of detail, and it was very pleasing to see this detail applied to modern problems.

Exhibition of Sculpture

An interesting Exhibition of Sculpture by Carl Milles, Professor at the Royal Art Academy, Stockholm, will be on view at the National Gallery, Millbank (Tate Gallery), from February 25 to April 18. There will be a Private View on February 24.

THE WORK OF CÉLINE LEPAGE

By KINETON PARKES

Architects do not usually include sculptural details in their designs, but content themselves with more or less summary indications and instructions. There are few sculptors capable of designing architecturally. Between the two classes there is a proportion of artists who feel acutely the necessity of the architectonic in sculpture and the plastic in architecture. One of these is Céline Lepage, the wife of an officer in the French Colonial Army, who has lived long in Morocco and studied and interpreted native life and nature in her modelling. She has also studied in other lands, for she was born in Warsaw, and knows the peasantry of Russia, the Caucasus, Asia Minor, Turkestan, and Spain. The primitive arts with which she has been brought in contact have had their influence and have emphasised in her work the ancient æsthetic principle that architecture embraces the content of all the graphic and plastic arts.

To this she holds with the greatest tenacity and even when she produces pieces with no direct architectonic appeal, as occasionally happens, they possess, nevertheless, a quality which is the distinctive property of her more direct and intentional decorative works. To her, sculpture means architecture in two aspects—the structural and the decorative. Like Rosandic, the Jugo-Slav artist, a tree-trunk appeals to her as a pillar naturally designed for architectonic treatment by the artist; but she does not, therefore, distort the natural form in the process. She creates her forms decoratively; they are architectural forms from their inception, and their decoration is part of their intrinsic structure.

Sagesse et Fêtes Galantes, here illustrated, is a complete piece of decoration in itself: a tree—root, trunk, branches, leaves and flowers—affords a central support for a capital above, and is itself supported by the caryatid-like nude female figures. Capitals for the spring of arches (*route nervée*) include the flowers and fruit of the palm as motives, and many other botanical forms have been utilised in her work. Animal forms,

too, have been requisitioned, and one of the most successful results is the cactus and greyhound head of a column, a really striking piece in its Gothic simplicity.

Exceptional in her designs, Céline Lepage is exceptional also in her way of work. She is a modeller and she is also a carver, but her methods of modelling differ from those of most sculptors in that her work is analytical and not synthetical. She gets her form as a carver does, from the outside. She does not build up, but digs down, regarding her mass of clay or plasticine as a whole, as others take a mass of stone or wood as a whole and makes a direct attack upon it.

The value of her method, it is claimed, lies in the fact that she combines the virtues of the two processes and is thus enabled to escape the dangers offered by modelling; on the one hand, of losing the essential glyptic quality of primitive sculpture, and on the other, the danger in work of architectural character of getting the wrong light and shade when a piece is placed in position. She claims that she can avoid the obvious dangers of carrying by her analytic method and remedy any faults in her work before she finally translates it into the ultimate material, and this without losing the first—and the last—touch of the artist, or the essential quality of glyptic work, as is done in mechanical translation of plastic models, by pointing, and by the manipulation of other persons. She claims by her method to avoid the necessity of any outside interference at all.

The quality of her work goes to prove the validity of her principles, while its original naturalistic character is refreshing in view of the tired reiterations of the old classical forms. She is a primitive and a neo-Gothic in her work, but only so far as spirit is concerned, for its newness is obvious and its essence precludes imitation.

Céline Lepage is an exhibitor at the Salons of the Société des Beaux Arts and the Artistes Décorateurs, and her work was seen at the Exposition of decorative Arts in Paris in 1925.

Sagesse et Fêtes Galantes.
CELINE LEPAGE.

Correspondence

Architectural Registration

SIR,—With the question of registration again looming large on the professional horizon, it is important that bodies such as the Association of Architects, Surveyors and Technical Assistants should express publicly, at the earliest possible moment, the views of its members on so important a subject. My Association approves the principle of registration, always providing that the scheme proposed will apply equally to all persons engaged in the profession, without regard to membership of this or that organisation or society. So far as can be judged at this early stage, the Bill sponsored by the R.I.B.A. can be described as fulfilling this condition. My Association has therefore decided to give general support to the scheme. Nevertheless, there are several points of special importance to salaried architects (who comprise the greater section of the profession), which it desires to see incorporated in the Bill, and which it is of opinion will have to be adopted before this section can be said to have reaped the full advantages which it is generally hoped registration will bring.

Although comprising the majority of those in the profession, salaried architects are the least powerful and the poorest paid. It is they who feel the worst effects of overcrowding, intermittent employment, and of the present casual and inefficient system of entrance to the profession. Their subordinate position—they are occasionally referred to as "ghosts"—is a perpetual stumbling-block to their ever becoming sufficiently well known in the profession to secure adequate representation on the councils and committees of architectural societies. Thus most of the protective measures, including registration, adopted by these bodies are framed without adequate regard to, or reliable advice on, the special circumstances of the salaried architects' employment and position.

As the only organised body recognised as representing solely the salaried architects, and with the object in view, therefore, of informing the profession of their wishes regarding this particular scheme, the A.A.S.T.A. has put forward to the R.I.B.A. Registration Committee the following proposals and amendments, all of which may be described as constructive, and in the opinion of my Council calculated to strengthen the Bill in so far as the special case of salaried architects is concerned.

(1) Since the expression "architectural assistant" is too vague, and is capable of bearing several interpretations, a definite interpretation would appear to be necessary in Clause 2 (*e.g.*, that the expression "architectural assistant" means any assistant architect, architectural draughtsman, student, pupil, or apprentice, or any other person engaged on architectural work). This amendment has been largely met by the R.I.B.A. Registration Committee, and Clause 5 (B) of the Bill has been amended to include a definition of the "five years" qualification, which period may now include any term of pupillage with an architect or in a recognised school of architecture. (My Council has been assured that the term "architectural assistant" will include any bona-fide architectural assistant no matter by whom employed or how graded by his employer.) In view of the many cases known to the Association where injustice might easily be done, my Council has considered it desirable still to press for a definition somewhat on the lines of the assurance received, which would be less vague than the simple expression "architectural assistant."

(2) In order that future entrants to the profession shall be known, and opportunity afforded for the adequate supervision of their training, a register of

students should be a provision in the Bill; such students or pupils to be registered at the commencement of their studies. In view of the decidedly vague knowledge possessed by the profession of the number which enters its ranks year by year, and the consequent lack of any definite and regular system of training, my Council is still pressing for the provision of a register of students within the Bill. The information and statistics which would be available from such a register would in turn enable the profession to provide adequate facilities for the training of all entrants, and so give them a fairer and more equal chance of becoming efficient architects, of obtaining their professional diploma and of passing any test set for registration than is ever possible under the present loose and inefficient system. The Registration Committee is still considering this amendment.

(3) In Clause 5 (B) it is provided that architectural assistants for a period of "five years immediately prior to" the date of the passing of this Act shall be registered. It is felt that in fairness to all architectural assistants the words "immediately" and "prior to" at the date of the passing of this Act should be deleted, the paragraph reading as follows: (B) "Was a bona-fide architectural assistant for a period of five years prior to the date of the passing of this Act." My Council, in submitting this amendment, was desirous of protecting the interests of two groups. First, the salaried architect who at the time of the passing of the Act might be unemployed. Second, the bona-fide assistant who, through lack of work within the five years prior to the passing of the Act, may have been unemployed or have accepted a temporary post outside the profession and so failed to qualify. As a result of my Council's representations, Clause 5 (B) has been amended by the Registration Committee to include all such bona-fide architectural assistants otherwise eligible on the register. There is nothing now in the clause to indicate that the applicant must necessarily be in some employment at the date of his application.

(4) That in view of the large proportion of assistants who will be registered, and who for several already well-known reasons will be unrepresented on the Council or Committee administering the Act, it is suggested that (a) at least two official representatives of the A.A.S.T.A. be nominated to the R.I.B.A. Council instead of one as at present, and (b) the Council should appoint at least one of these to any smaller Committee set up to administer the Act. (This principle was adopted by the R.I.B.A. Council when it set up the Unification and Registration Committee and Sub-Committee respectively in 1920 and 1921.) It will be observed that many of the amendments put forward by my Council have been adopted by the Registration Committee.

Yours faithfully,
JOHN MITCHELL,
General Secretary.

The archaeological and antiquarian publications of the Society for the Promotion of Christian Knowledge are conspicuous for two things, their accuracy and their cheapness. The latest publication we have received is a little pamphlet (price 3d.) dealing with the history of one of the most interesting churches in the kingdom—the Abbey Church of S.S. Peter and Paul at Dorchester-on-Thames, by H. S. Kirkpatrick, Principal of the Dorchester Missionary College. Should subsequent monographs of this nature be produced of the same format, they would, bound together, form an interesting addition to notes we already have on Gothic churches in the country, as these usually are only obtainable in leaflet form at the church itself.

New Ways and Means

The Editor will welcome early information of
New Plant, Materials and Fittings

The "Donaldson" Weather Bar.
(Donaldson Manufacturing Co. Ltd.)

Keeping Out the Rain

The "Donaldson" Storm-Proof Weather Bar for doors, recently patented and placed on the market by Messrs. Donaldson Manufacturing Co., Ltd., of 1a Blythswood Square, Glasgow, consists of a channel which runs the full width of the door, and is screwed down to the step on the outside (as shown in the sectional illustration), in which the weather bar itself rests by gravitative action without hinges or springs of any kind. When the door is open, this bar lies flat in the channel, and can be easily removed for keeping the latter free from dust and dirt. The device comes into action when the door is almost closed, and has slightly less than an inch of travel remaining, for at this point the nose of the "pintle" engages on the upturned edge of the weather bar, raising it into the position indicated, under cover of the "berge." The pintle, it should be noted, is screwed to the unhinged edge of the door, flush with the bottom, and the berge overhangs a groove running the full width of the door. Should any water collect in the channel while the door is open, it will drain out through "weep" holes provided for this purpose in the front angle of the channel. This device is made in sheradised or galvanised steel, and for new buildings it can be supplied in conjunction with the "Donaldson" Patent Concrete Step, which has the channel bedded in position. It can be equally well applied to the sills of casement windows opening inwards, as well as to doors.

A New Woodworking Machine

A motor-driven Cross Cutting and Trenching Machine of a new design, which has many advantages over the ordinary type of swing cross cut saw, and which will perform operations

not possible with the latter machine, is shown in two of our illustrations. This machine, which has been introduced by Messrs. Wadkin & Co., of Green Lane Works, Leicester, and of 11 Queen Victoria Street, London, E.C.4, can be fixed for convenience in any position in the workshop, no overhead structure being required. The saw operates in a straight line and not in an arc, as with the swing saw, and can therefore be used for grooving or trenching operations. The saw carriage can also be turned in either direction to any angle up to 45° for angular cutting, and when necessary the saw spindle can be canted from the horizontal to the vertical position and locked at any intermediate angle. The saw and slide frame are provided with raising and lowering motion for convenience in using smaller saws and trenching or grooving heads, this mechanism being totally enclosed, with its weight carried by a ball thrust washer. The saw carriage slide is mounted on ball bearings so that very little exertion is required in working the machine, whilst the saw is driven by a 3½-h.p. electric motor directly mounted on the saw spindle so that all belting is eliminated. This machine will cut off 20 in. wide by 4 in. deep when fitted with an alter-

Cross-Cutting and Trenching Machine:
Cutting Compound Angles.
(Wadkin & Co.)

inating-current motor. Using a direct-current motor, the depth of cut is reduced to 3½ in., as the D.C. motor is somewhat larger. Canted to an angle of 30°, an effective cut of 20 in. wide by 3½ in. deep can be obtained. The saw has a vertical rise and fall on the main column of 6½ in. for dealing with various thicknesses of material and for convenience in trenching or grooving, which can be carried out up to 24 in. wide by 1½ in. deep. Locking devices are provided on all slides for

New Motor-Driven Cross-Cutting and
Trenching Machine.
(Wadkins & Co.)

giving a positive lock in any desired position, and an automatic stop bar can be supplied with the machine for dispensing entirely with the necessity of "marking out" in repetition work. The saw table, which is of wood and not shown in our illustration, is preferably made by the purchaser to suit his own particular requirements, but the manufacturers will provide working drawings for a standard design which they have evolved.

A New Joint for Copper Tubes

A new compression coupling for light copper tubes has been introduced by Messrs. Manley & Regulus, Ltd., of Birch Street, Wolverhampton, who are represented in London by Messrs. Matthew Ellis, Ltd., of 31 Tabernacle Street, E.C.2. This "Speedy" Pipe Joint is claimed to reduce the cost of fixing copper pipes by one-half. Expanding or drifting is eliminated, with consequent saving in time and preventing any tube being scrapped through splitting. The tube, moreover, is not weakened as when expanded, neither is it necessary to cut the tube to dead length, as ample margin is allowed inside each coupling for fitting. A full clear way is also maintained at the joints. The method of fixing this "Speedy" Joint will be gathered from our illustration; the copper pipe (A) is passed inside the coupler (B), and the cap (C) is then screwed home, compressing the spigot (D) on to the copper pipe to make the joint. The manufacturers are able to supply a variety of standard fittings, such as elbows and tees, for tubes of ½-in. to 2-in. bore.

The "Speedy" Pipe Joint. (Manley & Regulus, Ltd.)

RIGHTS TO LIGHT

The Legal Aspect

The question of rights to light—and, for that matter, its twin problem rights to air also—has become so important with the growth of building and the value of space in congested areas, that it really forms a special branch of our law and one which architects, by reason of their duties and responsibilities to their clients, must continually bear in mind. As far back as 1611 the subject occupied the judicial mind in a case known as *Alfred's Case*, a suit in connection with the building of a pig-stye and obstructing lights, wherein it was resolved that the action was well maintainable; from which humble beginning it has developed into one of the most important questions in the reconstruction of our cities and planning of our towns.

Before dealing with the subject so far as it concerns architects and their clients, it would be well to consider the legal nature of a right to light—how it may be acquired and how it may be lost. Strictly, the right of property entitles the owner only to so much light as falls upon his land perpendicularly, the right, where it exists, to the reception of light in a lateral direction without obstruction, being an easement. Such an easement can be acquired (a) by prescription at common law; (b) by lost grant—a legal fiction introduced by the Courts to find a lawful origin for an easement long enjoyed, and by which a grant is pre-supposed to have existed; (c) by express grant; or (d) under the Prescription Act, 1832. Most cases, nowadays, fall within the statute whereby twenty years' actual and uninterrupted enjoyment of light confers an absolute right unless the enjoyment has been had under a written license or agreement given for the purpose. An owner may build up to the extremity of his own land and construct windows overlooking that of his neighbour, but it is open for the adjoining owner to obstruct such windows by building up against them any time within twenty years, and so long as he keeps within his own boundary; but if he permits the windows to remain unobstructed, then after the prescribed period has elapsed, the owner of the windows will have an absolute right to access of light through them, and has acquired an easement under the Act attached to his building. It must be understood that no such easement can be acquired in respect of vacant land, for the dominant tenement must be a building having an aperture.

When an owner has acquired a right to light, any substantial interference with his comfortable use and enjoyment of his building according to the ordinary usages in the locality is liable to be a nuisance and become actionable at common law. It has been laid down by a decision of the House of Lords that the test of the right of an owner of a building to bring an action to restrain an obstruction of light is whether the obstruction complained of does, in fact, constitute a nuisance, and to establish that fact evidence will be required as to whether the conditions are so altered that the dominant tenement—the building in respect of which the right is claimed—has been made substantially less comfortable for use or is left without sufficient light for ordinary comfort. It has eventually been decided that an adjoining owner may build so as to diminish substantially the light provided, so long as no actual nuisance is created. For instance, the light may be received through windows in a room or part of a building which would still receive adequate light for its usual use and comfort, even though diminished by obstruction, and such diminution would not necessarily be deemed a nuisance. The question as to whether there is a nuisance or not will

vary, in some measure, according to whether the building is situate in town or country.

The wording of Section 85 of the Metropolis Management Amendment Act, 1862 (repealed and re-enacted without modification by Section 49 of the London Building Act, 1894) has been responsible, in the past, for a fallacious notion that so long as a person has 45 degrees of unobstructed light left him through a particular window, he cannot maintain an action for a nuisance caused by diminishing the light that formerly came through that window, but there is no rule of law in support of this, though it is considered to be a fairly good working rule that where such an angle of light is left, a person cannot suffer any appreciable amount of injury.

The foregoing remarks will doubtless suffice to illustrate the importance of the subject of rights to light, not only to the building owner, but also to the architect who is responsible to him, for whilst the architect is not under obligation to understand the legal construction of documents or statutes, for the elucidation of which he is entitled to look to his employer's legal advisers, he is nevertheless required to be familiar with the general rules applicable to the subject. Lest the architect should be charged with being unskilful, he should at the outset enquire of his employer as to whether there are any known rights affecting the land to be built upon, and particularly any rights to light in connection with adjoining buildings to which the proposed site would be subservient. On making his inspection of the site he should make a point of ascertaining for himself, and consider and advise the building owner, as to whether his requirements would constitute an interference with any such rights. It is quite easy to imagine that if the architect has failed to do this, the consequences are liable to be serious, for, whilst in some cases an obstruction of light can be remedied by obtaining a licence at a rent, or other arrangement of terms, where buildings are very valuable and the owner's rights most jealously guarded, such a means of escape may not be open, with the result that the offending building may have to be pulled down or plans altered, entailing much expense to the owner on the one hand, and loss of fees to the architect on the other, in addition to rendering him liable to his employer for negligence and any resulting damages.

Competition Result

Canberra War Memorial

The National War Memorial Committee have been unable to pick outright the winner of the Australian War Memorial Architectural Competition, and have awarded the prize jointly to Mr. Sodersteen and Mr. Crust, both of Sydney, who will work in collaboration. The designs provide for a War Memorial Museum with a Hall of Memory, in which will be inscribed the names of Australia's sixty thousand dead.

The seventy-nine competitors in the competition included many Australians resident in Great Britain and the United States. Mr. Sodersteen is the youngest private architect in Sydney, while Mr. Crust is the Chief Draughtsman of the Commonwealth Works Department. It is estimated that the Memorial will cost a quarter of a million pounds. (Reuter).—*Architect Copyright.*

“PROBLEMS OF THE TALL BUILDING”

Some Recent American Developments

By HOWARD ROBERTSON. Photographs by F. R. YERBURY.

Reports of fantastic developments in skyscraper construction in the United States follow one upon the other to stun the poor, humble European architect who feels that a 12-storey building is still a daring achievement.

Not long ago came news of the fresh record which was being set up by Detroit, the home of Henry Ford, in the shape of the “Book Tower,” destined to be the tallest building in the world, rising 873 ft. from the ground level, with 81 storeys above the ground and 4 below, and exceeded only by the 1,000-ft. high Eiffel Tower. The Book Tower is to have other claims to distinction besides mere height, in the shape of “the largest searchlight in the world” on its summit, and a garage on its ninth and twentieth floors allowing parking space for close on 1,000 cars. And in addition it appears to be conceived in a vigorous architectural expression, not a little reminiscent in its vertical emphasis of its prototype, the Woolworth building, which must now feel very modest with a paltry 792 ft. and only 55 storeys.

The new Larkin Tower proposed for New York has, however, put an end to all petty rivalries by contem-

plating 108 storeys and a height above street level of 1,208 ft., leaving the Woolworth building, as it were, waist-high, and dominating the whole of Manhattan with its twenty-two million dollar bulk.

The site proposed for this latest adventure in tall building is in 42nd Street, between 8th and 9th Avenues, which is a neighbourhood at present laying just claim to be considered as the hub of New York. It is a district, therefore, which is already a victim of all the problems of congestion and transport which affects business areas, and to which the construction of a building such as the Larkin Tower would add to an extent which could only be measured by those who have closely followed the debate on the pros and cons of the skyscraper from the town-planning standpoint.

At the present time there is great difference of opinion as to whether the skyscraper, America's most notable contribution to architectural history, is a boon or a curse. Harvey Corbett believes that the tall building is an asset, that it is not a primary cause of traffic congestion, and is, on the contrary, “the most practical form of ready relief.” In a recent article in the *New York Times*, he argues the case for the sky-

Fig. 2.—THE WOOLWORTH BUILDING . . . "THE MASTERPIECE OF CASS GILBERT."

scraper on practical and æsthetic grounds, but the arguments are less easy to follow than those of the critics. Corbett believes that "to move thousands of people by means of elevators within a few hours is a simple problem, but a highly complicated one to move them along the streets. . . . Not the restriction of the skyscraper, but the best application of the principle, is the problem we must solve . . . the concentration of skyscrapers in definite centres is a logical development. It brings into close-knit unity the many parts of a related industry. Let us assume for a moment that we have 50,000 persons engaged in the Garment Centre, all of them confined within four blocks. Can we believe that traffic would be improved, or any other important end gained, by distributing these 50,000 people over innumerable blocks, perhaps in scattered sections of the city? . . . If we turn attention to London, we find an area of streets in proportion to building area far exceeding that known to New York. . . . Yet London has not a single skyscraper. And its traffic problems are more serious than we find in New York."

As against this pleading of Mr. Corbett comes the active hostility of the City Club, a very important New York organisation, which has as its main *raison d'être* an enlightened interest in civic affairs, and which has recommended that New York shall be immediately re-zoned with the object of putting a stop to the construction of buildings beyond a height equal to the width of the street on which they abut, except in the case of towers which are spaced so that æsthetically and practically they are unobjectionable. In support of this recommendation, the City Club points out that the immense number of people congregated in skyscrapers are a severe tax on the transportation system, and that from this point of view conditions are growing steadily worse.

The Larkin Building, as the zoning regulations at present stand, is within the law as regards its height and bulk. It is planned to comply with the zoning of the districts in which it is situated, and which allows a building to rise sheer, without a set-back, to a

height equal to one and a half times the width of the street on which it faces. Other zones vary between a fraction of the street width to two and a half times the width in a neighbourhood like Wall Street, where the streets are narrow but the building plots very small, but on 42nd Street, where the width is 100 ft. the Larkin Tower would be able to have a sheer façade of 150 ft., and in 41st Street, 60 ft. wide, a height of 90 ft. From these heights up the building would be "zoned" back, according to the set-backs required, until the base of the tower is reached. New York buildings may have towers which do not occupy a space of more than one-quarter the size of the site, but even towers are obliged to set back an average of 1 ft. in every twelve, so that if carried up indefinitely the tower portion would eventually reach a point.

This would mean that it would be quite possible to go up higher than the Larkin Tower, but the question always arises as to the practical and economic limitations which are imposed in these immensely tall structures.

From the economic standpoint, there is the difficulty that, after a certain height, the various "services" of the building become so enormously developed that the point can be reached where there is about 60 per cent. of the space given over to services and only 40 per cent. as usable area. There have been various reports as to the poor economic return of buildings such as the Woolworth, and of large sums having to be credited to advertising value as an offset to an actual rental return of only 2-2½ per cent.; but certainly there must be financial prospects in the skyscraper, for the capital outlay is so vast as to suggest that the project represents a fairly safe investment.

There are, however, many difficult problems involved for the architect and engineer, and possibilities, at least for the former, of which it cannot be honestly

Fig. 3.—A "DOWN-TOWN" CHASM.

said that the designers of the Larkin Tower seem to have taken full advantage.

The zoning laws of New York, and the setting back of street frontages which they entail, have resulted in a sort of pyramidal massing which has the elements of powerful and dramatic composition, as can be gathered from the recently taken views of New York which we illustrate to show how the character of the city's sky-line is being affected. The effect can be exceedingly fine, as with the Ritz Tower and the blocks of apartments (Figs. 4 and 5), which latter do not, however, rise to skyscraper dimensions. At the same time, much of the setting back derives its æsthetic interest and value from the contrast with straight façades, and it is quite possible, as the grouping in Fig. 1 suggests, that a wholesale introduction of the terraced *motif* will result in monotony and a sense of irresponsibility in the study of silhouettes, due to acceptance of the zoning regulations without regard to how their limiting requirements may be best handled from the architectural standpoint.

As regards engineering difficulties, limitations do not appear to be in sight, at least as far as New York is concerned, where the solid rock foundation will take a safe load far in excess of anything imposed by the Larkin Tower, the maximum figure of which will not exceed 60 per cent. of the 35 tons per square foot allowed on that particular site. Wind pressure, too, does not present any especial difficulties, as the average pressure on tall buildings is calculated at not more than 22 pounds per square foot, which is equivalent to a 100 mile per hour gale. Much greater pressure than this is provided for in the scheme of bracing; but, of course, there is always the economic factor to contend with, the mass of steel for stanchions and bracing in a building of 1,200 ft. taking up a great deal of space, in addition to that occupied by vents, machinery, etc.

Fig. 5.—CONTRASTS IN SCALE AND SILHOUETTE: A TYPICAL NEW YORK JUXTAPOSITION OF OLD AND NEW.

It is in this respect that limitations may be imposed, and already we can see the difficulties in the problem of elevators, which are, of course, the life-blood of these tall buildings. There will be sixty elevators in the Larkin Tower, two of which will ascend to the 82nd floor, and from there on will be "shuttle" elevators to the top floor. It would be possible to take the main elevators higher than 82 floors, but there is always the problem of additional cables and powerful machinery; and yet if a system of changes of car is imposed in the upper reaches of these tall buildings, the trouble and loss of time will soon make the higher offices unpopular with business men. No doubt perfection of elevator design and equipment will solve this problem in due course, and nothing will then remain to stop the production of super-Larkin structures except the load and stress which all the materials concerned, including mother earth, will be able to bear.

It is to be hoped that before that time comes the law will provide some more tangible limit than the present one, which appears to be the sky. Even with the present modern heights in which New York indulges there are apt to be produced occasional suggestions of architectural menace and even terror, as can be judged from Fig. 3, where the edge of the Equitable building leers at the bewildered traveller down a dark crevass between two lofty massive blocks. If buildings go much higher than Cass Gilbert's masterpiece (Fig. 2), the problems of light and air and transport, already acute, will probably become unbearable. And there is always lying in wait another problem, that of the life of materials and the danger of crystallisation. As it is, the life of steel-framed buildings has never been truly ascertained, the original skyscrapers, such as the "Flatiron" building (1907), having been pulled down; there is nothing to prove that some of the new and very much taller buildings may not suffer from strange ills which present moderation in the matter of height has not as yet revealed.

Fig. 26

Fig. 27

THE TWENTIETH CENTURY HOUSE

VII.—Sunlight and Ventilation

By A. TRYSTAN EDWARDS.

The provision of adequate sunlight and ventilation in houses is an important element in hygiene, and we are faced with the problem how to satisfy these hygienic requirements while at the same time paying proper regard for other considerations, which must also be observed if architecture is to inspire us with the respect which is due to it as an art expressive of our social and æsthetic instincts. In the last article I showed a few diagrams illustrating lay-outs in which the claims of sunlight has indeed been conceded, but which suffered from the grave defects of being architecturally most displeasing.

To ensure that a certain minimum of sunlight should enter the rooms of houses erected on modern building estates it has been suggested, and in certain instances enforced, that houses facing each other should not be less than 70 ft. apart and that their backs also should be at a minimum distance of 70 ft. from the backs of the houses nearest to them at their rear. It may well be imagined what a monotonous lay-out is apt to result when such a rule obtains, and especially where this minimum becomes also the maximum, as it must necessarily do when the building owner seeks to place as many houses on the site as this hygienic restriction allows. If in Fig. 25 the rows of semi-detached cottages had all of them been straight like the one on the left-hand side, it would have illustrated the type of lay-out which results from an obedience to this precept. It is not an exaggeration to say that there are many thousands of cottages recently erected which in their general configuration bear a resemblance to such a lay-out. Hygiene, of course, is safeguarded thereby, sunlight and ventilation stream into the houses, but at what cost? We may say that it is at the cost of the human dignity of those compelled to dwell therein, for they appear to have been planted out upon the country-side as if they were no better than cabbages. It need not be assumed that the XXth century house need be modelled upon such an example.

In Fig. 25 I have shown in the second row of houses a slight set-back from the road at one point. I have assumed that this departure from the straight line is decided upon for the sake of variety, but what must be the result if the 70-ft. distance between the houses is to be observed? The row behind this one must also have a dent and the next row as well. It is obvious that on restricted sites the 70-ft. rule leads to many difficulties in the designing.

What other rule should be imposed, it may be asked, in order that in this matter the claims of hygiene and æsthetics might be reconciled? In order to ascertain the incidence of sunlight in streets of various orientation, I have constructed a diagram,

and this diagram presents facts which justify us in making certain broad distinctions between the rules which should govern the respective widths of streets having various orientations. Thus while being scientifically constructed it yet enables us to escape from the architectural monotony which would result when the same restriction of minimum width governs all the streets on an estate. It will be observed that the table deals with no less than fourteen orientations of street differing from each other by intervals of 15 degrees. To cut the argument short, however, I propose to limit my deductions from the table to a comparison between north and south streets and east and west streets, and shall leave the reader to consider the intermediate orientations himself.

Before proceeding further, it is necessary to introduce at this point a brief explanation of the diagram. The graphs are based upon the position of the sun in latitude $51\frac{1}{2}$. It is assumed that each street is of uniform width and continues indefinitely. The depth of the streets is taken to be the distance between the buildings as measured from front to front and from back to back, the distance in each case being the same. The street is described as being in sunshine when the whole of the wall surface of one side of the street is in sunshine. Hence the total amount of sunshine in the street is equal to the sum of the hours of sunshine on the front and back of each house. In the construction of these graphs it has also been assumed that the buildings on either side of the street have flat roofs and are of the uniform height of 9 ft. Calculations concerning the amount of sunshine in streets of taller buildings can easily be performed because the amount of sunshine is not dependent upon the actual height of the façade, but upon the ratio of that height to the width of the street. For any given direction, Latitude and time of the year, a street of buildings 10 ft. high and 10 ft. apart has exactly the same sunshine as the street of buildings 100 ft. high and 100 ft. apart. Thus the conclusions derived from the diagrams have reference to all buildings with flat roofs. The most convenient way of obtaining results which will be approximately direct for buildings having other kinds of roofs is to assume an increase in the height of the façade, the increase being in each case commensurate with the pitch of the roof and the distance from eaves to ridge. The solid line of the graph indicates the maximum number of hours of sunshine for streets of various widths, that is, the sum of the hours of sunshine on both sides of the street. The dotted line divides this total into its component parts of sunshine on the south and north sides of the street. Thus Fig. 4A in the diagram shows that at midsummer a street running from south-west

SUNLIGHT IN STREETS

A GRAPH SHOWING HOURS OF SUNSHINE IN BROAD AND IN NARROW STREETS OF DIFFERENT ORIENTATIONS

PREPARED BY A. TRYSTAN EDWARDS

Fig. 28

Fig. 29

Fig. 30

to north-east and 20 ft. wide has a total of $12\frac{1}{4}$ hours of sunshine, of which $3\frac{3}{4}$ hours are upon the south side and $8\frac{1}{2}$ hours are upon the north side of the street.

For instance, supposing we ask ourselves how much sunshine can a street of buildings 90 ft. high and 50 ft. apart running due east and west obtain at midsummer, the answer is that this street has as much sunshine as a street 9 ft. high and 5 ft. wide. Consulting Fig. 7A, we see that this amounts to $10\frac{3}{4}$ hours. Again, let us put another type of question. If it be required that a street which runs from south-east and north-west and has buildings 30 ft. high on either side should obtain 6 hours of sunshine at the time of the equinox, how wide must the street be? Consulting Fig. 4B, we observe that in order to have 6 hours sunshine a street 9 ft. high must be 30 ft. wide; therefore a street of buildings 30 ft. high must proportionately be about 43 ft. wide. And in order to show how the tables can be used for yet a third type of problem, we may ask ourselves, "What is the limit of height of buildings of a street 45 ft. wide running due north and south if it is decreed by a bye-law that every house shall have a possible 9 hours of sunshine in the height of midsummer?" Consulting Fig. 9A, we see that for a street 15 ft. wide the limit of height is 9 ft. Hence for buildings facing a street 45 ft. wide the limit of height should be 27 ft.

It has been customary for writers on sunlight in streets to consider the winter solstice only, but reference to the graph shows that the amount of sunshine obtainable in mid-winter is so small (especially in streets running east and west) that it seems scarcely worth planning for; moreover, when we recollect that in winter the sun only shines on the average about one-tenth of the 7 hours or so which intervenes between sunrise and sunset, it becomes obvious that we would do better to take into consideration the amount of sunshine which can be obtained at other periods of the year and do the best we can to get as much of that as possible into our streets. I am not here venturing to propose any definite minimum number of hours of sunlight which ought to be insisted upon, nor do I express an opinion as to whether such a standard, if formulated, should be based on the behaviour of the sun at midsummer or at the equinoxes, or upon an average between the two, but shall content myself with drawing some general conclusions from the graphs.

In the first instance, it may be affirmed that a street approximating to the direction north to south may be fairly narrow, provided that there is an ample space at the rear of the houses, or if these streets are very broad, there is no need for the houses to have so much space at the back. The top part of Fig. 26 shows the type of lay-out which would result if the 70-foot rule were rigidly enforced; the lower part of the diagram illustrates how the width between buildings can be varied without detriment to the total

amount of sunshine which falls upon them, for while at its narrowest points the width of the street is reduced to 40 feet, the distance between the buildings at the back is increased to 85 feet, so it may be assumed that while the front rooms are rendered slightly less sunny, the back rooms are more sunny; so it cannot be said that the total amount of sunshine entering the house has been lessened thereby. Moreover, this treatment has the advantage that while the density of the houses upon the area remains the same, a larger garden-space at the back is made possible. Again, a part of the row can be set back to form an architectural pattern without there being any sacrifice of sunshine, because reference to the graph Fig. 3 shows that in streets running approximately north and south both sides of the street are exactly similarly situated in respect of the total hours of sunlight which fall upon it, the only difference being that on one side the sun shines from the east and on the other from the west. Thus in such streets there is no point at all in insisting upon a definite minimum distance between houses on opposite sides of the street, for there can be quite reasonably a "give and take" provided that if the front of the house is near the house opposite, the back shall be correspondingly further away from the backs of the houses at its rear. For instance, in Fig. 27 the two streets of houses are only 40 and 25 feet width respectively, but the distance at the back of the houses is 130 feet. Assuming that these are cottages having one storey only above the ground floor, it may be calculated from the graph that at midsummer houses in the broader streets will get as much as a possible five hours sunshine during the day, and three and a half hours at the equinox, while even in the narrow streets the houses will have nearly four hours sunshine at midsummer and two and a half hours at the equinox. But these figures relate only to the sunlight which falls in the street. On the backs of the houses where the distance between is 130 feet, there will fall a possible seven hours at midsummer and five hours at the equinox, *in addition* to the other amounts. In the previous examples, I have assumed that the houses on either side of the street were continuous, but if they are in detached or semi-detached formation, as in the lower part of Fig. 27, it is reasonable to suppose that they might be set even closer together back to back without a sacrifice of sunlight, provided that the distance between their fronts was proportionately large. In this example it is assumed that it was desirable to set the houses as far from the road as possible in order that they might be clear of the dust and noise of vehicular traffic. The point I am insisting upon here is that in streets running approximately north and south quite a number of variations in the type of lay-out can be obtained without sacrificing sunlight. Of course, it is obvious that more sunshine would penetrate the rooms if the houses were all detached, but my object here is to consider whole groups and

streets of buildings, such as must necessarily be erected if the dictates of convenience and economy are to be observed. For it is neither convenient nor economical to arrange all the buildings of a city, or even of the suburbs, in a formation of monotonous detachment and isolation as if the whole world were a vast fever hospital. And for indoor occupations direct sunshine is not always an unmixed blessing. In factories and business houses it is often purposely excluded, and even a kitchen is supposed to be better for a north light. It is all the more necessary, therefore, that there should be plenty of gardens and playgrounds for children.

While north and south streets allow great flexibility of treatment, inasmuch as in this orientation narrow streets may be permitted provided that there be ample space at the backs of the houses, in east and west streets this compensation of sunlight at the back of houses placed in narrow streets is possible on the south side only, for however much open space be provided on the north side, the amount of extra sunshine thereby obtained is very slight. The centre division of Fig. 28 illustrates this clearly.

The sunlight graph shows that for all except the winter months the streets most favourably situated with regard to sunlight are those running due east and west. It is remarkable that a street thus orientated, and composed of buildings 24 feet high, would at midsummer have eleven hours possible sunlight if it were only 15 feet wide, and even at the equinox to enjoy this amount of sunshine it need be only 36 feet wide. And if we were governed by considerations of sunlight alone, it would be scarcely worth while to increase the width beyond this point, for the graph shows that the sunlight is already almost at its maximum. On the other hand, it would be most unwise to reduce the width to 30 feet, for at the time of the equinox this slight narrowing of the street would deprive it of ten hours sunshine! Such a result is due to the fact that, in this instance, to a person standing on one side of the road the sun appears to be travelling in a path which for a long distance almost coincides with the top line of the buildings opposite, so a small increase or decrease in the width of the road makes all the difference between sunshine and shadow. The right hand division of Fig. 28 shows rows of houses equidistant, but for this orientation the distance would be excessive (as far as sunlight is concerned), unless, of course, the buildings were very high. The left hand division, again, shows that where the houses are detached it is possible without sacrifice of sunlight to reduce the distance between the façades on either side of the street. In Figs. 29 and 30 the information conveyed in the sunlight graph has been employed to devise lay-outs in which the maximum of sunlight in the streets has been obtained on a site containing as many as from 25 to 30 houses to the acre, while at the same time the formation is free from monotony, for quite a number of different street proportions and architectural shapes have been introduced. It will be observed that while in the north to south streets there is a "give and take" with regard to the space to the front and back of the houses, the narrowest streets having the broadest spaces at the back, the east and west streets are of fairly constant width, the only variation occurring where the houses abutting on these are detached or semi-detached.

These illustrations perhaps suffice to show that in order to give sunlight its proper due it is not necessary either to put architects in a strait waistcoat or to plan houses eccentric in individual shape and in their general lay-out.

In the next article I shall consider the problem of the internal planning of a detached house so that the maximum of sunlight shall enter the rooms.

Book Notices

Spons' Architects' and Builders' Pocket Price Book. (E. & F. N. Spon, Ltd., London). 5s. net.

This little book, first published in 1875, is fully indexed, and any information required can be found in a moment. Among the salient features of the book the following may be mentioned: Prices for works in all trades, excavator to paperhanger, arranged in the order of bills of quantities. Current rates of wages, constants of labour, rough estimates, preliminaries, taking down and removing, credits for old materials, etc.

Spons' Practical Builders' Pocket Book. (E. & F. N. Spon, Ltd.).

This companion volume to "Spons' Pocket Price Book" contains information indispensable to the architect and builder. It is arranged alphabetically, and is extremely handy for purposes of reference.

Drainage and Sanitation. By E. H. Blake, C.B.E. (B. T. Batsford, Ltd.). 15s. net.

During the last few years there has been but little activity in regard to domestic sanitation, and, intended primarily as an introduction to the subject, this book should prove of interest to both the novice and the experienced practitioner.

Brickwork. By F. Walker. (Crosby Lockwood & Son, London). 2s. 6d. net.

The object of this book is to give the artisan a general and practical insight into his trade. The book commences with the site of a building, and goes through the successive stages of the bricklayer's trade, including roof tiling.

Design in Everyday Life and Things. (The Year Book of the Design and Industries' Association). Edited by John Gloag. (Ernest Benn, Ltd.). 10s. 6d. net.

This book is an attempt to bring facts about planning into focus. Every country in the world, the authors state, that solves a problem of design by clear thinking solves it agreeably, and in making the scope of their illustrations international, the Design and Industries Association has not been actuated by any spirit of belittling comparison.

The Rome Scholarships

The Faculties of Art of the British School at Rome have selected the following candidates to compete in the final competitions for the Rome Scholarships of 1927:

ARCHITECTURE.—J. Breakwell (Architectural Assoc.), R. P. Cummings (Queensland and Architectural Assoc.), W. H. G. Dobie, T. C. Haynes, and R. G. Heal (Liverpool Univ.), D. G. Mirams (London Univ.), M. S. Smith (Sydney and London University), S. L. Thomson (Melbourne and Architectural Assoc.), and J. B. Wride (Cardiff Technical College).

DECORATIVE PAINTING.—R. C. Brill (Slade School), N. Dawson (Royal College of Art), A. R. Griffiths (Swansea Art School and Royal College), and B. Willis (West Bromwich School of Art and Royal College).

SCULPTURE.—H. D. Gilbert (Royal Academy Schools), A. B. Ingram (Nottingham School of Art and Royal College), H. W. Parker (Central School of Arts and Crafts and Royal College), and E. Webb (Nottingham School of Art and Royal Academy Schools).

The works executed by the successful and unsuccessful candidates in the preliminary stages of the competitions are on exhibition in the Imperial Gallery of Art, Imperial Institute, South Kensington, until the end of February, from 10 to 5.

AN EXHIBITION OF THE WORK OF CARL MILLES

An interesting exhibition of sculpture by Carl Milles opens at the National Gallery, Millbank (Tate Gallery), on February 25. Born in 1875, he studied for some time in his native country, travelled into France and Germany, and was appointed Professor at the Royal Academy of Arts in Stockholm in 1920. It is seldom that an artist achieves recognition at the early age of 27, and then by winning an open competition of which he had defied the conditions. This was so, however, in the case of Carl Milles, whose ingenious sketch for a monument of Sten Sture, to be erected at Upsala, did not represent the Founder of the University merely as a decorative figure surmounting a plinth, but as a leader in the War of Liberation at the head of that army of peasants which was to defeat the Danes at Brunkeburg. This was in 1902, when, as can be seen from the group itself (which was not erected, however, until 1924), he came most markedly under the influence of Rodin.

DETAIL FROM COLUMN: NEW CONCERT HOUSE, STOCKHOLM. CARL MILLES, Sculptor.

A TRITON FROM THE FOUNTAIN GROUP "EUROPA" AT HALMSTAD, SWEDEN. CARL MILLES, Sculptor.

From that date he never ceased from the tireless labour in his studio among the hills of Lidingö, where for 25 years he has been producing every conceivable type of work, and work treated and handled differently to express its individual function, but which all bears the unmistakable impress of the author's personality. The detail illustrated from the New Concert House, Stockholm, is a model for a figure crowning a column to be erected in the grounds, and gives the impression that the artist was fully conscious of the enormous change his work would undergo by so much foreshortening. One of the most charming of his memorials is that figure of ecstatic youth known as "The Sunsinger," dedicated to the memory of Tegner, the national poet of Sweden and author of the majestic hymn to the sun. This was erected in Stockholm during the autumn of 1926. At the same time, Milles erected at Halmstad, a town of 30,000 inhabitants in the west of Sweden, the particularly forceful fountain group of "Europa and the Bull." A detail of this group, a Triton in bronze which is illustrated above, is greatly characteristic of Milles' later work. A sketch is on view of the proposed memorial in London to Emanuel Swedenborg, the great scientist, philosopher, and theologian. This shows a messenger descending from God, and Swedenborg, in a moment of ecstatic prayer, kneeling to receive the revelation. This work has been described as so typical of Carl Milles, and expressing so adequately the idea and his conception of the man, that we await its final execution with the greatest interest. There is also on view a detail of the memorial, a figure of Swedenborg in wood; and details in bronze of the "Europa" group at Halmstad, which was unveiled on November 7 of last year.

BUILDING CRAFTSMANSHIP—OLD AND NEW—VIII

By Nathaniel Lloyd, F.S.A.

PAYCOCK'S HOUSE: FIRST FLOOR BEAMS AND JOISTS.

The carving of the joists is different on each side of the beam. Those on the left have a "P" introduced amongst the carving, for Paycock, the builder. Richly carved beams are characteristic of this locality.

PAYCOCK'S HOUSE: SECOND FLOOR BEAMS AND JOISTS.

The mouldings are particularly bold. The joists have leaf stops, somewhat similar to those at first floor. The boards between would be rebated into the beams and joists and with them form the surface of the floor over.

THE CARPENTER AND ALLIED CRAFTS

Building News in Parliament

WESTMINSTER, *Wednesday, February 23.*

The spokesman of the Office of Works brought a storm about his ears the other day when he told the House of Commons that the Department had effected a saving of £43,000 on the maintenance and repairs of public offices, historic buildings and ancient monuments, for which it is responsible throughout the country. Several Members immediately demanded information as to how the saving had been managed. Had it been done by neglecting repairs, which might be a false economy, or by not carrying out repairs to historic buildings, which might lead to disaster?

Lieut.-Commander Kenworthy, who was hot in the attack, declared that "he would much rather see the Government fall into oblivion for ever than see one of our historic buildings suffer for lack of a little necessary expenditure." Sir Henry Slesser, speaking with equal emphasis, said it was a terrible thing that "an ill-starred demand for economy should allow irreplaceable ancient buildings to be imperilled." When this and a great deal more of the same kind had been said, it occurred to Captain Hacking, who represents the Office of Works in the House, to make a few inquiries of the officials of that Department. As a result of these, he was able to assure the House later that, contrary to his first statement, there had really been no saving at all on the maintenance and repair of ancient monuments. The storm blew over, but it had the useful effect of showing the Government the temper of a considerable section of the House on the subject of historic buildings.

An interesting statement as to the policy of the Commissioners of Crown Lands in connection with the rebuilding of Regent Street was made by the Minister of Agriculture. He stated that, when granting new building leases in that street, the Commissioners specified a minimum sum to be expended on the erection of suitable buildings, but it is believed that in most cases the minimum has been largely exceeded. While the original leases reserved rents amounting in the aggregate to £26,383 9s. 7d., it is estimated that, on completion of rebuilding, the rents will amount to £450,000 a year. The new lettings on rebuildings in some cases include small additional areas adjoining, but not actually in, Regent Street.

In reply to questions on the subject, the Minister said that these figures were apparently the value of the land and that there had not been a sudden rise of the rents. In 1914 the leases began to fall in, and there had been a gradual increase in revenue as more and more of the property had been let. He added that the measure of leasehold reform which the Government propose to introduce would apply to Crown lands.

So widespread and emphatic was the opposition which revealed itself in the House to the Covent Garden Bill, promoted by the trustees of the Beecham Estate, that it has been abandoned. It was realised that the attempt to get the Bill through the House of Commons would be hopeless.

Admittedly the progress of house building in Scotland still lags behind that of England, but it is showing a considerable upward tendency. It is generally assumed that 20,000 new dwelling-houses represent the annual requirements of Scotland, and this year there are 19,000 houses already in course of construction, with a further 8,000 in early prospect, making a total of about 27,000. Major Elliott, the Under Secretary for Scotland, stated recently that, of this number, only about 1,000 are steel houses, and that, therefore, no favouritism has been shown towards this "alternative" form of building.

Coming Events

Association of Architects, Surveyors, and Technical Assistants (Midland Counties Division).—Friday, February 25.—Mr. B. J. Aston on "A Review of Modern Wall Decoration." Birmingham Chamber of Commerce.

The London Society.—Saturday, February 26.—A visit is intended to the new headquarters of the British Medical Association. It is hoped that Sir Edwin Lutyens will be back in time from India to attend this visit.

The Royal Institute of British Architects.—Monday, February 28.—Mr. Harvey Corbett on "Organisation and Cost of the Building Industry in America." 8 p.m. Conduit Street, W.1.

Glasgow Institute of Architects.—Tuesday, March 1.—Prof. A. E. Richardson on a subject to be announced.

The Institution of Heating and Ventilating Engineers.—Wednesday, March 2.—Discussion on Dr. Margaret Fishenden's paper (read February 9), "The Effect of Weather Conditions upon the Heat Requirements of a House." 12 Russell Square, London W.C.1. 7 p.m.

Incorporated Institute of British Decorators.—Thursday, March 3.—Mr. Ivor Beaumont, A.R.C.A. on "Pioneers of Decorative Art in England." Painters' Hall, Little Trinity Lane. 8 p.m.

The Auctioneers' and Estate Agents' Institute of the United Kingdom.—Thursday, March 3.—Mr. H. Mordaunt Rogers on "The Making of a Connoisseur." 29 Lincoln's Inn Fields, London, W.C.2. 7.30 p.m.

The Royal Institution of Great Britain.—Friday, March 4.—Sir Herbert Jackson on "Some Colouring Agents in Glasses and Glazes." 21 Albemarle Street W.1. 9 p.m.

Birmingham Architectural Association.—Friday, March 4.—Members' Meeting.

The Bristol Society of Architects.—Friday, March 4.—Mr. Bernard Cayley, F.R.S.A., on "Modern Paintwork."

The Liverpool Architectural Society.—Wednesday, March 9.—Mr. H. L. Beckwith, F.R.I.B.A., on "A Visit to Schools in Holland and Belgium."

Manchester Society of Architects.—Wednesday, March 9.—Mr. Harry S. Fairhurst, F.R.I.B.A., on "Notes on a Visit to America."

Edinburgh Architectural Association.—Wednesday, March 9.—Mr. George L. Peplar on "Regional Town Planning."

Sheffield, South Yorkshire and District Society of Architects and Surveyors.—Thursday, March 10.—Mr. F. R. Yerbury on "Some Modern Building Abroad."

Manchester Building Trades' Exhibition.—March 25 to April 9.—Particulars from Provincial Exhibitions Ltd., City Hall, Manchester.

In the course of a lecture on "Sunlight," at Gresham College, recently, Professor Leonard Hill said that records kept during the last two years showed that a sanatorium in Oxfordshire had received three times the amount of sunlight that had been obtained in Kingsway, London. They had got rid of sewage out of water and cleaned up the streets; the great hygienic reform demanded to-day was to rid the air of pollution. The known loss of sunlight through smoke was the visible rays, the heat rays, and the ultra-violet rays. The last did not pass through ordinary glass, but did penetrate quartz and the new vitaglass. This last had been fitted to the roof of the lion house at the Zoo, and there had been a big improvement in the animals' pelts.

No. 2.

Manufacture.

The methods and modes of manufacturing Marseilles Tiles are altered and improved as every invention, which constitutes an advance, is placed on the market. The presses are of an extremely elaborate and reliable kind, and no expense is spared in arriving at a finished article, which is as near perfect as money and brains can make it.

LANGLEY LONDON LIMITED
161 BOROUGH HIGH STREET, LONDON, S.E.1

MARSEILLES
ROOFING — TILES

Professional Societies

Royal Institute of British Architects

The Council of the R.I.B.A. are holding a series of Informal Illustrated Lectures on Architecture confined to workers in the building trades: Wednesday, March 2, 1927, at 8 p.m. Subject: "Surface Treatment of Concrete and Cast Stone." Lecturer: Mr. H. A. Holt, A.I.Struct.E.; Tuesday, March 8, 1927, at 8 p.m. Subject: "Liverpool Cathedral." Lecturer: Prof. C. H. Reilly, F.R.I.B.A.; Tuesday, March 22, 1927, at 8 p.m. Subject: "General Materials." Lecturer: Mr. H. Jarman (Superintendent of Works, H.M. Office of Works). All men employed in the work of building are cordially invited, admission being free.

EXHIBITION OF ARCHITECTS' WORKING DRAWINGS.—An Exhibition of Architects' Working Drawings will be held in the R.I.B.A. Galleries from February 28 to March 11. The exhibition will be open daily between the hours of 10 a.m. and 8 p.m. (Saturdays 5 p.m.), and will include drawings lent by Mr. E. Guy Dawber, F.S.A., President R.I.B.A. (a House); Mr. Michael Tapper, A.R.I.B.A. (St. Mary's, Harrogate); Messrs. Granger & Leathart, A.A.R.I.B.A. (Kensington Kinema). The exhibition is intended primarily for students of architecture; they will be able to examine the drawings that a practising architect hands to a contractor, and thus will be afforded an insight into the methods adopted in a modern architect's office. A special students' evening will be held at the exhibition on March 3 at 8 p.m.

THE TITE PRIZE AND THE SOANE MEDALLION.—The attention of intending competitors is called to the fact that the preliminary competitions, consisting of twelve hours "en loge," for the Tite Prize and the Soane Medallion, will be held on April 7 and 8 respectively at the R.I.B.A. and at local centres. N.B.: The dates for the competitions have been advanced from July. Applications for admission to the preliminary competitions, which must be made on the official forms to be obtained free at the R.I.B.A., must be sent to the Secretary to the Board of Architectural Education so as to reach him not later than March 26.

INTERNATIONAL EXHIBITION OF ARCHITECTURAL DRAWINGS, AUSTRALIA.—A request has been received by the R.I.B.A. that the Exhibition of British Architectural Drawings which is being sent to Melbourne, Australia, for the International Exhibition there in May, 1927, shall be forwarded to Sydney at the close of the Exhibition in Melbourne. As the Exhibition is primarily intended to interest the general public, it will consist of rendered elevations, perspectives, sketches, etc. Architects who are willing to send drawings for this Exhibition for selection by the R.I.B.A. Exhibition Joint Committee are requested to make immediate application to the Secretary, R.I.B.A., for the necessary form and particulars. The works will be required at the R.I.B.A. at the end of February for shipment to Australia early in March.

R.I.B.A. INTERMEDIATE AND FINAL EXAMINATIONS AND RELEGATED CANDIDATES.—The attention of candidates is called to the fact that the Council of the R.I.B.A. has decided that unless a candidate passes in at least two subjects in the Intermediate and Final Examinations he shall be required to take the whole of the Examination at a subsequent sitting.

The South Wales Institute of Architects

The Annual General Meeting of the South Wales Institute of Architects, Central Branch, was held recently at the Institute Rooms, Cardiff. The following Officers and Members of the Executive Committee were duly elected: Chairman—Mr. J. Llewellyn Smith, L.R.I.B.A., Aberdare; Hon. Treasurer—Mr.

Harry Teather, F.R.I.B.A.; Hon. Secretary—Mr. W. S. Purchon, M.A., A.R.I.B.A.; Executive Committee—Messrs. Percy Thomas, F.R.I.B.A., T. Alwyn Lloyd, F.R.I.B.A., Ivor Jones, A.R.I.B.A., H. N. Edwards, Frank H. Heaven, A.R.I.B.A.; Representatives of the Associates and Students—Mr. C. H. Evans and Mr. G. L. Price. A discussion on the aims and objects of the Branch terminated the meeting.

Birmingham Architectural Society

The annual dinner took place recently of the Birmingham Architectural Association. Mr. Holland W. Hobbiss (the President) occupied the chair.

Replying to the toast of the Royal Institute of British Architects, Mr. E. Guy Dawber said there was a growing feeling that if they were to get the best out of life they must get the best architecture. The country was being aroused to the fact that they must, by some means or other, put a stop to the erection of those indifferent and ugly buildings that were being put up without proper supervision and without thought, and that were spoiling not only their country towns and villages, but also their cities. We are suffering from this in London just as much as you are in the great provincial cities and towns. The time has come when we, as architects, should combine together to see if steps cannot be taken to prevent these terrible eyesores, which are the result of ignorance and indifference. The Institute had been helpful in the formation of a Council for the preservation of rural England, and the enthusiastic way in which the movement had been taken up augured well for its success. Proposing the toast of "The City of Birmingham," Mr. William Haywood referred to the proposed new civic centre, stating that the scheme would provide many sites for big buildings. It was to be hoped that these buildings would be examples of architecture of which the city would be proud.

The Lord Mayor (Alderman A. H. James), responding, said that Birmingham could not claim to be the city beautiful. They were all familiar with the contributory causes of its present condition, but the present generation of public representatives were alive to their responsibilities in the direction of beautifying the city. Properties were being acquired and sites purchased with the view of making the new Birmingham civic centre the finest in England.

Drawing and Architecture

The teaching of drawing was discussed by Mr. George Atkinson, A.R.C.A. (London), Head Master of the Metropolitan School of Art, Dublin, at a recent session of the Technical Education Commission in Dublin. Mr. J. Ingram, Chairman, presided. Mr. Atkinson gave it as his opinion that some special system of administration, such as existed in an alliance of the Ministries of Trade and Ministries of Instruction in other countries, would be necessary for the adequate development of the Metropolitan School of Art into a National College of Art for Ireland. Mr. R. M. Butler, M.R.I.A., Professor of Architecture, University College, Dublin, said that so far as he could see the only practicable way of replacing the old methods of craft training was by well-organised technical education. Mr. George F. Beckett, who gave evidence on behalf of the Royal Institute of Architects of Ireland, said that there were many contractors who were not qualified, either technically or in business methods or capacity.

The Westminster City Council, on the advice of its Housing Committee, has definitely turned down any idea of utilising the Pulford Street site for a housing scheme, despite the efforts of the Westminster Housing Association to promote the scheme.

**Protect the Timber
with
SOLIGNUM**

DRY ROT cannot exist where Solignum is used. Hidden woodwork is made permanently safe when treated with Solignum.

The cost of protecting the timber with Solignum is negligible compared with the cost of repairs and renewals.

*The hidden woodwork that should
be preserved with Solignum*

Ends of ridge boards built into walls.
Ends of purlins built into walls.
Wall plates and ends of joists.
Backs of skirtings, architraves,
window linings.
Backs of door frames and door
linings.
Backs of all window frames.
Floor boards laid direct on concrete

and nailed to fillets embedded in
concrete. It is absolutely essential
that fillets and floor boards
should be treated with Exterior
Brown Solignum before being laid,
else Dry Rot is bound to occur.
All roof timbers.
Ground floor joists should be treated
all over.

Regd. Trade Mark.

London Building Notes

BECONTREE.—A shopping centre is planned by the Becontree Housing Estate on the corner site in Becontree Avenue and Valance Avenue. A contract for one block of houses and shops has been let to Messrs. T. N. Hughes, Ltd., 30 Clements Road, Ilford, whilst plans for further shop rows are being prepared by Mr. Edward Meredith, A.R.I.B.A., 35 Broomhill Road, Goodmayes.

BEDFORD PARK.—Progress is reported in the accumulation of funds for the erection of the new buildings at the Bedford College for Women in Regents Park, N.W.1. This scheme, as referred to recently in "The Architect and Building News," involves an outlay of £110,000 on new chemical laboratories, lecture halls, physics laboratories, residential quarters, etc., from the designs of Sir John W. Simpson, P.P.R.I.B.A., and Mr. Maxwell Ayrton, F.R.I.B.A., 3 Verulam Buildings, Gray's Inn, W.C.

BRIXTON.—An important site development scheme is taking place at the corner of Brixton Road and Stockwell Road, S.W.8, where a block of shops and offices is being built to the design of Messrs. T. P. Bennett & Son, F.R.I.B.A., 41 Bedford Row, W.C. The completed plans provide for a row of 15 shops, each with a 20-ft. frontage, and the building of the first 6 is in the hands of Messrs. James Smith & Son, Ltd., South Norwood, S.E.25.

DOWNHAM.—It is proposed to build, on the Baring Road frontage of the L.C.C. Downham Housing Estate, 33 houses of five rooms, 190 of four rooms, 240 of three rooms, and 28 two-roomed flats, at a cost of about £300,000. The contractors are Messrs. Holland & Hannen & Cubitts, Ltd., 258 Gray's Inn Road, W.C. The plans have been prepared by Mr. G. Topham Forrest, F.R.I.B.A.

FLEET STREET.—An office building is to be erected on the site of No. 54 Fleet Street, E.C.4, for Messrs. Marcus Estates, Ltd., 9 New Bridge Street, E.C.4, plans for the premises having recently been approved. The new offices have been designed by Messrs. Treherne & Norman, Windsor House, Kingsway, W.C.2.

ISLINGTON.—Work has commenced upon the enlargement of the Highbury Hill School at Islington, N.1, which is to involve about £45,000. The work will be carried out by Messrs. C. P. Roberts & Co., Ltd., 38 Tyssen Street, Dalston, E.8, under the supervision of Mr. G. Topham Forrest, F.R.I.B.A., architect to the L.C.C. Education Committee.

KENSINGTON.—A new nurses' home is to be erected at the St. Mary Abbott's Hospital, in Marloes Road, Kensington, W.8, for the Kensington B.G. The new building has been planned by Mr. A. J. Hodgeman, 80 Coleman Street, E.C.2.

MARYLEBONE ROAD.—Work has commenced upon the reconstruction of the premises of Messrs. Madame Tussaud's Waxworks Exhibition, Ltd., in Marylebone Road, W.2. The work will take about 18 months to complete, costing

£150,000. The builders are Messrs. Humphreys, Ltd., Knightsbridge, W., whilst the architect is Mr. F. Edward Jones, F.R.I.B.A., 8 Gloucester Mansions, Cambridge Circus, W.C.

MOORGATE.—Operations have commenced upon the site at the corner of Moorgate and Finsbury Square, E.C.2, where it is proposed to build the large addition to Britannic House, the headquarters of the Anglo-Persian Oil Co., Ltd. The building will be erected by Messrs. Howell & Williams, Ltd., 11 Bermondsey Street, S.E.1, and will complete the original designs for Britannic House, which were prepared by Sir Edwin Lutyens, R.A., 17 Queen Anne's Gate, Westminster, S.W.1.

NEW CROSS.—The Governors of the Goldsmiths' College, at New Cross, S.E., have in prospect an extension of their buildings by the erection of a new block for housing the engineering and building departments. The scheme will be carried out by the London County Council in collaboration with the governing body.

PADDINGTON.—An appeal for funds is being made by the governors of the Paddington Green Children's Hospital at Paddington Green, W.2, in order to build new premises and enlarge the existing ones generally. Two wards are projected, and it is hoped to put the preparation of plans in hand at an early date.

POPULAR.—The elementary schools in Upper North Street, Poplar, E., are to be completely rebuilt and modernised, at a cost of some £30,000. Plans have been prepared by Mr. G. Topham Forrest, F.R.I.B.A., architect to the L.C.C. Education Committee, and the contractors are Messrs. F. R. Hiperson, 6 Broad Street Place, E.C.2.

PURLEY.—The Coulsdon and Purley U.D.C. is to build a range of municipal buildings, comprising a town hall and fire brigade station (recently illustrated in THE ARCHITECT AND BUILDING NEWS). Plans have been prepared by Messrs. Nicholls & Hughes, 4 Raymond's Buildings, Gray's Inn, W.C.2.

ST. PANCRAS.—At a recent meeting of the shareholders of the St. Pancras House Improvement Society, Ltd., a letter from Colonel Levita (chairman of the L.C.C. Housing Committee), intimating that the society could now go ahead with their building plans in Drummond Terrace, Somers Town, N.W., was read. The society have acquired 70 houses and 10,000 square feet of open space, and propose, as already mentioned in THE ARCHITECT AND BUILDING NEWS, to expend £25,000 on the modernising of the houses and the erection of a block of flats on the open space. The hon. architect is Mr. I. B. M. Hamilton, B.A., A.R.I.B.A., 16 Old Buildings, Lincoln's Inn, W.C.

SOUTHWARK.—A garage and light repair depot is to be erected in Long Lane and Southall Place, S.E.1, by Messrs. Upsons, Ltd., boot manufacturers, 8 Great Dover Street, W.1. Plans have been prepared by Mr. John H. Wilson, 29 Trinity Square, S.E.1.

WEMBLEY.—A new Primitive Methodist church is to be erected on a site in Ealing Road, N.W. Plans have been prepared by Mr. H. Kels Armitage, 130 Haverstock Hill, Hampstead, N.W., whilst the building work is being carried out by Mr. George Warboys, 35 Norton Road, Wembley.

WESTMINSTER.—Old buildings have been pulled down and the site of Nos. 8, 9 and 10 Great George Street, S.W.1, cleared in preparation for the erection of a large block of offices and premises. The new building has been designed by Messrs. Arthur Blomfield & Driver, Grocer's Hall, Prince Street, E.C.2.

WOOLWICH.—Land in Albion Road, Trinity Street, S.E., has been acquired by the directors of the Royal Arsenal Co-operative Society, Ltd., 125 Poplar Street, Woolwich, S.E.15. It is proposed to adapt certain existing premises into manufacturing premises and to build branch stores and showrooms to the designs of the Society's architects.

The Institution of Quarry Managers

The Annual Conference of the Institution of Quarry Managers is to be held this year at Harrogate, from June 27 to July 2 inclusive. Again this year, an exhibition of quarry machinery, plant, etc., is to be held in conjunction with the conference, and numbers of applications have already been received for spaces.

Bethesda Concrete Houses

A scheme has been prepared by Mr. F. J. Rees, Surveyor to the Bethesda Council, for constructing six-room parlour-type houses, containing modern conveniences, at a cost of £2,500 for single houses and £360 each for blocks of six and less in terraces. The houses, made of concrete, would be eligible for the subsidy, and could be built for sale by the Council on a basis governed by the Small Dwelling Acquisition Act, or, alternatively, they could be profitably let for 6s. 6d. per week. The Surveyor has been instructed to seek a favourable site on which three blocks of four houses each could be built, after which the Council would approach the M.H. to sanction the complete scheme.

Shopfitters' Annual Dinner

Messrs. E. Pollard & Co., Ltd., Clerkenwell, recently held their 31st staff dinner at the Wharfedale Road, Great Central Hotel. Mr. Edward Pollard, managing director of the company, was in the chair. The chairman in his speech dealt with the increased activities of the firm in spite of the unsettled conditions of last year and said that owing to the expansion of the company new branches would shortly be opened at Bristol and Glasgow. Mrs. Harold Pollard responded with a souvenir made by the company, their Highbury works, in the form of a filing cabinet, appropriately filled with photographs of the company, which was presented to every guest.

The Hall Mark of Your Craftsmanship

IF, to the casual observer, much excellent workmanship in an installation is "beneath the surface," yet there is ample scope for individualistic and visible expression, and it is with the "Crabtree" Shelloid Switch Covers and Base Rings that you have your opportunity of adding deft points of finish to your work.

* * *

So we again draw your attention to the refined finishes in these Switch Covers, which, having a dignity of their own, confer distinction to your efforts—

GOLD AMBER TORTOISE-SHELL IVORY
SILVER MARBLE LAPIS LAZULI

And to the fact that, as the Base Rings can be supplied either in harmony with or in contrast to the Switch Covers, you have a wide scope for unique treatment in harmony with existing decorative schemes.

Unit plates 4 feet or 1 metre square give tanks with capacities ranging from 220 to 1,000,000 or more gallons, for the storage of water, fuel oil and other liquids.

The Week's Building News

The following abbreviations are used: U.D.C. for Urban District Council; T.C. for Town Council; R.D.C. for Rural District Council; E.C. for Education Committee; B.G. for Board of Guardians; P.C. for Parish Council; B.C. for Borough Council; M.H. for Ministry of Health; M.T. for Ministry of Transport; C.B. for County Borough; B.E. for Board of Education. Direct confirmation should be obtained before commitments, for which we cannot be responsible, are made.

ADWICK-LE-STREET.—The U.C. has provisionally let tenders for 108 houses at Adwick Lane, the price being over £56,000.

ALFRETON.—The Rev. Father Joseph Herld is erecting a new church on Nottingham Road, for which he has prepared the plans.

ASHTON-UNDER-LYNE.—Messrs. Lindley & Ginson, architects, Market Avenue, have a scheme on hand for improvements to the P.S.A. Brotherhood Assembly Hall at Arlington Street. No contracts have been placed. It is proposed to go forward with the new Lees Road scheme, which is estimated to cost £42,000.

BATTERSEA.—The M.H. has sanctioned the erection of the sixth block of tenements on the Plough Road Improvement scheme, at an estimated cost of £3,727 7s. 11d.

BALLYCASTLE.—At a meeting of Ballycastle R.C., Mr. F. Black, J.P. (chairman) presiding, an additional scheme was adopted for the provision under the Labourers' Improvement Acts of 51 cottages in the rural area, at a probable cost of £17,794 17s.

BELFAST.—The Post Office authorities have acquired a site adjoining Cromac Street and May Street, Belfast, on which it is intended to erect a new Central Telephone Exchange for Belfast.

BEXLEY.—Plans were recently approved for 2 houses, Upton Road, Bexley, for Mr. W. Grubb; 8 houses, Central Avenue, Mr. A. Hargreaves; 2 houses, Hook Lane, Mr. A. Beard.

BIDEFORD.—The M.H. has sanctioned the erection of 32 houses at Handy Cross, Bideford, and tenders ranging from £421 to £445 per house, according to type, have been referred to committee.

BIRMINGHAM.—The Bank Committee are to erect new bank buildings at King's Heath, and are inviting tenders for the work. The Corporation intend to sanction the erection of 7 dwelling-houses and shops and 17 lock-up garages, workshop and store in Alum Rock Road, a sports' pavilion at King's Heath, and a Control Tower at the Horse Show Ground.

BIRMINGHAM.—The B.G., at a recent meeting, considered and adopted the following proposals in connection with the Dudley Road Hospital: The erection of an additional nurses' home to accommodate 100 nurses, at an estimated cost of £35,000; the provision of a sick bay to accommodate 20 nurses, at a cost of £6,200; the erection of a new mortuary and post-mortem room, at an estimated cost of £7,000; heating works of various blocks, etc., to cost £6,000; the erection of sanitary turrets, etc., in the children's block, to cost £5,000; the erection of sanitary turrets and provision of a lift in the maternity ward, at an estimated cost of £4,600; and

the provision of a room in connection with the massage and electrical department, at a cost of £2,800.

BLACKPOOL.—The Building Plans Committee approved 66 plans, which included 352 new houses.

BOLTON.—The Committee decided to erect public conveniences for men and women at the junction of Chorley New Road and Beaumont Road.

BRIGHTON.—The E.C. have decided to remodel the Richmond Street and Circus Street Elementary Schools in the summer, at an estimated cost of £20,500.

CARBIS BAY.—Plans have been prepared and submitted by Messrs. Cowell, Drewitt & Wheatley, for a new church at Carbis Bay.

CARDIFF.—The Guardians have decided to have detailed plans prepared for additional accommodation in a new three-storey wing extending over the land recently acquired from the owners at King's Castle Hotel. The estimated cost is £5,500. The architects are Messrs. Wilmot & Smith, 4 Park Place, Cardiff.

CARDIFF.—The City Council propose to erect 198 houses at Ely.

CAVERSHAM.—Messrs. Bethell, Swannell & Durnford, 16A John Street, Adelphi, W.C., are preparing plans for the erection of new branch stores at Caversham, for the Reading Co-operative Society.

CHESTERFIELD.—The foundation-stone for the erection of a new Wesleyan Church in Derby Road has now been laid. The plans have been prepared by Mr. W. A. Derbyshire, architect, of Chesterfield. The building will cost £2,650.

CHESTER-LE-STREET.—At a meeting of Chester-le-Street U.D.C. the architect submitted the lay-out plan for 280 additional houses.

CLITHEROE.—A further 60 houses are to be built on the new road between Henthorn and the Eddisford Roads, at an estimated cost of £28,000.

CLITHEROE.—The T.C. have received the sanction of the M.H. for the erection of 60 houses to front the new highway between Eddisford and Henthorn Roads, at an estimated cost of £28,000, to the plans of their surveyor, Mr. A. R. Bleazard.

CROYDON.—The Committee recommend that, subject to the approval of the M.H. and to the Ministry's sanction to a loan for £18,650, the purchase price and costs, 57 acres of land at Waddon be acquired for housing purposes. The Committee appointed Mr. William H. Ashford, A.R.I.B.A., of 32 Paradise Street, Birmingham, architect for the Winterbourne Central School, and Mr. A. Sunderland, L.R.I.B.A., architect for the new school at Waddon. Plans passed: — Paish, Tyler & Crump, East Croydon, 4 garages, 199-205 South Norwood Hill; Scratchley Bros., Woodville Road, 24 garages, The Retreat, High Street, Thornton Heath; P. Richardson, 136

Addiscombe Road, 1 shop and 1 house, and 2 houses, Morland Road, corner Jesmond Road; Paish, Tyler & Crump, Addiscombe Road, 2 houses and garages, Upfield Road, Plots 31 and 32; H. P. Hawkes, Sanderstead Road, house and garage, Woodmistletoe Road.

DRAYTON.—The M.H. have sanctioned the purchase of sites for the erection thereon of 36 houses, and R.D.C. have provisionally accepted tenders for their erection.

DUNBARTONSHIRE.—The Education Authority propose to erect a school clinic at Kirkintilloch, at an estimated cost of about £6,000.

DUNDEE.—The Dundee Housing Committee recommends the Corporation to build 500 new houses in various parts of the town.

EALING.—The Council has received sanction to borrow £103,000 for the erection of 30 houses at Greenford and 30 at Heston.

EASTBOURNE.—The T.C. have decided upon the erection of 30 houses of two-bedroom type on the site of Hutments in Victoria Drive.

EGHAM.—The U.D.C. have approved plans for the erection of 30 cottages, Wentworth Estate, Virginia Water, Messrs. W. G. Tarrant, Ltd.

ELEPHANT-AND-CASTLE.—The ambulance station at the Elephant-and-Castle is to be rebuilt, at a cost of £1,650.

ELTHAM.—Plans are to be prepared for the erection of a new school on the Well Hall Estate, Eltham. The school is to be built on the open principle, and the estimated cost is £40,833.

ELTHAM.—Plans have been passed by the L.C.C. Education Committee for the erection of an elementary school at Ealdham Square, Eltham, at an estimated cost of £40,000.

FAILSWORTH.—The U.D.C. have decided to proceed with the erection of 40 houses on the Lord Lane site, which tenders are to be invited.

FLEETWOOD.—The T.C. have agreed upon a scheme for the erection of 100 houses.

FULWELL.—The Middlesex E.C. have decided to proceed with the erection of a junior school.

FURNESS.—Bardsea Hall, in the Furness district of North Lancashire, has been purchased by Messrs. H. A. Wilson & Co., of Newcastle-on-Tyne, and Ripon, for demolition.

GLASGOW.—Another big store is to be erected by a London firm in Glasgow. Messrs. Upsons, Ltd., have been granted permission by the Dean and Guild Court to demolish existing buildings, and erect warehouses, a shop, offices at the north corner of Renfrew Street and Drury Street. The premises will be four storeys high. Other plans passed included a station at Killoch Drive, Knightswood, for the Clyde Valley Electric Power Company; sub-stations at Woodlands

SOME TRADITIONS OF
THE PLASTERER'S CRAFT

*Drawn by W. M. Keesey, A.R.C.A., A.R.I.B.A.
Historical data and matter by George Bankart.*

HERE is Giovanni Manni da Udine, who was Raphael's assistant, experimenting with a plaster similar to that found in the ruined Baths of Titus. The low relief work in the Loggia of the Vatican was done with this plaster, which gave a fresh impetus to the art of decorative plastering in Europe.

This plaster required years of preparation but to-day cement is perfectly plastic and waterproof when it is mixed with

The word 'PUDLO' is the registered Trade Brand of Kerner-Greenwood & Co. Ltd., by whom all articles bearing that Brand are manufactured or guaranteed.

Road and Oxford Drive, for the Glasgow Corporation Electricity Department; and for the Glasgow Corporation, to form roads and sewers and erect dwelling-houses in Edgefauld Road and Macfarlane Street and Balgray Bank.

GUILDFORD.—Mr. C. L. Gill, F.R.I.B.A., is in consultation with the special committee of the Corporation regarding the scheme for new municipal buildings and an assize court.

HALESOWEN.—The Worcestershire E.C. propose to make extensions to the Grammar School. The cost of the extensions is estimated at between £18,000 and £20,000.

HAMMERSMITH.—The erection of two new schools, for 400 children each, on the Wormholt Estate, Hammersmith, is recommended by the London Education Accommodation Sub-committee. The County Council housing scheme for the estate provides for a total of 741 houses.

HAMPSTEAD.—New buildings are to be erected by The Hampstead Garden Suburb Institute, which will provide accommodation for a fully equipped school of arts and crafts.

HULL.—The news was received by the Hull Town Planning Committee recently that the M.H. have given sanction for a loan of £26,000 for a new road to Paull.

ISLINGTON.—The Finance Committee of the B.C. have recommended that application be made to the Electricity Commissioners for sanction to borrow £29,137 for new boilers at the electricity station, and that application be made to the L.C.C. for sanction to borrow £39,225 for the reconstruction of Camden Road, Tollington Road and Isledon Road.

LISKEARD.—The Housing Committee reported to Liskeard Rural Council recently that the houses in Liskeard and Lanreath parishes were now nearing completion. It was recommended that the normal rents be fixed at 6s. 6d. per week, although that would involve a loss to the Council of 9d. per week, which would fall on the rates. The recommendation was accepted. The committee suggested that the houses about to be erected at Talland, St. Dominic, and South Hill should be of the non-parlour type, but that those at Menheniot should be the parlour type. Agreed to.

LIVERPOOL.—Plans of the new "open-air" school which is being built in Walton Hall Avenue, Liverpool, to the designs of Mr. Bernard Widdows were recently exhibited and explained by Mr. G. H. Widdows (architect to the Derbyshire E.C.) at a meeting of the Liverpool Educational Research Society. Instead of walls there will be glazed doors, which will be kept wholly or partly open. The light will come through a long, continuous skylight, and the rooms will be heated by hot-water pipes under the floors. The building will be completed before September next. Mr. Widdows said the cost of a modern elementary school worked out at from £34 to £40 per head of the scholars.

LIVERPOOL.—A new parish hall for Holy Trinity is to be erected at Church Road, Wavertree, to the plans of Mr.

H. L. Beswick, architect, 5 Cook Street, Liverpool.

LIVERPOOL.—Bishop Dobson visited St. Sebastian's parish, Fairfield, Liverpool, recently, and laid the first stone of the new £12,000 schools, which will accommodate 400 children.

LONDON.—Owing to the rebuilding of Spitalfields Market a new street will be made between Brushfield Street and Lamb Street.

LONDON.—Mr. C. A. Aish is to erect buildings on the site of Nos. 2, 9 and 10 Marble Arch.

LONDON.—A report of the L.C.C. in regard to the Old Vic, Waterloo Road, mentions that it will soon be imperative to commence the scheme for structural alterations to meet the requirements of the Council.

LONDON.—The Metropolitan Railway propose to build shops and flats, with restaurant and other amenities, on the now unused site at Baker Street Station.

LYTHAM ST. ANNES.—The members of the New Church have decided to build a church on the Star Hills Estate at the corner of Ansdell Road South and Cambridge Drive. The building will cost about £2,500. The contract has not yet been placed.

MANCHESTER.—Plans approved by the C.C.: Erection of new premises, Butler Street and Ridgway Street, for the Beswick Co-operative Society, Ltd.; 21 lock-up garages, Austin Drive, Fog Lane, for E. Turner, Ltd.; 40 houses, Cotton Lane, Withington, for Sparke & Stephens; 10 houses, Church Street and Woodlands Road, Cheetham, for A. C. & S. Halsall; new warehouse, Granby Row and Samuel Ogden Street, for E. S. Sayek, Ltd. Architects: Messrs. C. Clegg & Son, 38 Brown Street.

MANSFIELD.—The Mansfield T.C. recently decided to invite tenders for the erection of 114 houses on the Ravensdale Estate, and that the Housing Committee be instructed to consider the advisability of building 10 others by direct labour in order to test the value of the system.

MANSFIELD.—The Highways Committee approved plans for 139 houses, and of these 124 were on the Corporation's new Ravensdale Estate.

NEWCASTLE.—Mr. G. G. Carr, who has a contract for the erection of houses on the Walker Estate, is to erect a further 15 houses, the cost being estimated at £6,500.

MARYLEBONE.—The B.C. Housing Committee recommend the retention of the services of Messrs. H. V. Ashley & Winton Newman, F.R.I.B.A., of 14 Gray's Inn Square, for the preparation of estimates, etc., in connection with the Carlisle Street improvement scheme, which involves a total expenditure of £1,250,000.

NEW LONGTON.—The U.D.C. are proposing to erect 12 houses at Tarleton; a site has not yet been decided upon.

NEWRY.—The U.C. recently decided to promote a scheme for the building of 40 artisans' houses in the West Ward of the town, at an estimated cost of £11,000, the houses (which are to be built on the lines of the Drogheda houses) to be let at from 5s. to 6s. 9d. per week.

ORRELL.—The U.D.C. have decided

to acquire land in Park Road Moor Road for housing purposes where they propose to erect 12 parlour and 30 non-parlour houses.

PAIGNTON.—Messrs. H. Lloyd & are to build 24 houses in Mainde Lane, Paignton.

PADDINGTON.—A new telephone exchange, to be called Ambassador, will be opened in Market Street, Paignton, W., in a few months.

PLYMOUTH.—Plans are being prepared for a new house, garage, terrace, etc., at Crownhill, for Captain Charles C. Cartwright. Mr. Lionel Vanstone, of 15 Old Town Street, Plymouth, is the architect. Plans have been approved by the B.C. for a 12 garage, stables and cart sheds at Highbrook Villa, Lower Compton, Plymouth, for Mr. J. Daw. Architect, Lionel F. Vanstone, 15 Old Town Street, Plymouth.

PLYMOUTH.—The Y.M.C.A. are carrying out extensions and improvements at the Service Men's Institute at an estimated cost of £5,000.

POOLE.—The Corporation have viewed a scheme for the erection of a bathing pavilion, shelters, etc., at Sandbanks, at a total cost of £10,000.

PORTSMOUTH.—A new church hall, cost £12,000, is being planned at Eastney, near Portsmouth.

PRESTON.—The Electricity Committee have been authorised to proceed with the scheme for the installation of a fourth generating set at the Rivington Power Station, at a cost of £140,000. The Housing Committee have a scheme under consideration for the erection of double-storeyed flats.

RADCLIFFE.—The M.H. have sanctioned the erection of a further 10 houses on the Outwood Road site, at a cost of £19,236.

READING.—Plans for new cottages are being prepared by Mr. M. Bethell, Swannell & Durnford for the Reading Co-operative Society.

RISCA.—It is proposed to erect another 200 houses on the Ty Isaf Estate, where a considerable number of houses have already been built. The County E.C. propose to erect a school on the same site.

ROCHDALE.—Mr. E. Haworth, 112 South Parade, is proposing alterations to his premises.

ROTHERHAM.—Plans have been approved for the erection of 30 houses at Aughton, 22 houses at Swallow and 28 houses at Treton.

SALFORD.—Negotiations are taking place between representatives of Salford City Council and a syndicate of financiers for the sale to the Council of the 10½ acres site of Salford Central Market. It is stated that building the value of £1,000,000 will be eroded including an exhibition hall, shopping centre, cinema, skating rink, and an underground garage.

SCARBOROUGH.—Instead of extending the present hospital and dispensary, Scarborough, at an estimated cost of £40,000, the board of management have announced that they have decided to build an entirely new hospital on a fresh site.

SCARBOROUGH.—The T.C. have approved a scheme for the proposed construction of the café's depot, at a cost not exceeding £5,500.

Telephone: Victoria 0405 (3 lines)

SEAHAM HARBOUR.—On behalf of Messrs. Snowden Bros., Messrs. W. & T. R. Milburn have prepared plans for the erection of a café, bakery and dance hall in North Railway Street, Seaham Harbour.

SHEFFIELD.—The foundation-stone has been laid for the new Baptist Chapel at Crookes, which is estimated to cost £4,000.

SHEPTON MALLET.—At the monthly sitting of the Shepton Mallet R.D.C. the Housing Committee asked for and received sanction to purchase six acres of land for £600 on which to erect Council houses. The committee recommended that the purchase of a site at Croscombe be not proceeded with at present.

SHREWSBURY.—The E.C. adopted proposals to erect a new school on the racecourse, with accommodation for 350 boys, at an estimated cost of £10,500. Further proposals are to enlarge the Church Schools to accommodate 830, and to erect a new elementary school in Coleham, for 300 infants, at an estimated cost of £9,000. The total cost of these schemes was estimated at £28,000.

STACKSHEADS.—A plan has been approved for the erection of a new church at Hattock End Lane, for the members of St. Joseph's R.C. Church.

STRATFORD, E.—A contract has been signed with Messrs. Henry Knight & Son, of Tottenham, N., for the rebuilding of the central front block of Messrs. J. R. Roberts' Stores, Ltd. The facings are to be of Messrs. Carter & Co.'s white Ceramic Marble, and the bronze-arcade windows to this section and the two side wings constituting an arcade 260 ft. long are by Messrs. Courtney Pope & Co. The architects for the whole scheme, costing about £25,000, are Messrs. George Baines & Son, F.F.R.I.B.A., A.I.Struct.E., of 121 Victoria Street, S.W.1.

SUNDERLAND.—The Freemasons of Sunderland are contemplating the building of a new Masonic Temple. One of the sites suggested is the Bade Tower in Burden Road, upon which a building costing some £30,000 may be erected.

SURBITON.—The U.D.C. propose to carry out extensions to its Council offices, at an estimated cost of £5,460.

SWANSEA.—Plans have been approved for the erection of a new hall and institute for the Kenfig Hill and Pyle Miners' Welfare Association. The new building will contain a public hall, to seat over 1,000 persons, billiard hall, etc. The cost is estimated at £8,000. The architects are Messrs. Culpin & Bowers, of London.

TEWKESBURY.—The Corporation is to erect 12 houses on the Priors Estate.

TEDDINGTON.—The U.D.C. have decided to instruct the General Purpose Committee to prepare a scheme for a municipal building in conjunction with the scheme for a new fire station.

THORNE.—Building records are being made at Thorne colliery village, where 60 houses a month are being erected to complete a contract by the end of the year. At the Thorne colliery brick-

works 39,000 bricks are being made daily.

THORNHAM.—The St. James's Church Building Committee have decided to proceed with the erection of the west end of the new church. The cost of the completed church will be £15,000. The present portion will cost £10,000. The plans have been prepared by the diocesan architect, Mr. E. Martin, 90 Deansgate, Manchester.

TRURO.—The Prince of Wales will visit Truro on Wednesday, June 8, to lay the foundation-stone of the new school hall and further extension to Truro College.

TYNEMOUTH.—The Corporation Health Committee are considering a site at Balkwell for the erection of a general infectious diseases hospital.

WESTMINSTER.—Messrs. Robertsons, Ltd., of 217, Knightsbridge, are to erect shops fronting Rochester Row, Westminster.

WIGAN.—The T.C. has decided to extend the Town Hall buildings, at an estimated cost of just over £12,000.

WILLESDEN.—The M.H. have allowed the appeal of Messrs. R. Costain against the refusal of the U.D.C. to grant the housing subsidy in respect of 1,394 houses to be erected on the Brentwater Estate. The plans have therefore now been approved by the Council.

WINDSOR.—Plans for 210 houses and bungalows by Mrs. Wilson, president of the Women's Engineering Society, to be erected at Englefield Green, near Windsor, have been approved by Egham Council.

WOMBWELL.—The U.C. are giving their support to a scheme under which it is proposed that Ardsley House, Ardsley, near Barnsley, shall be required by certain out-townships around Barnsley for use of Isolation Hospital. The house and grounds of about 20 acres have been offered to the out-townships by Mr. G. R. Micklethait, at a cost of approximately £6,000.

WORCESTER.—Subject to the consent of the Staffordshire E.C., the Worcester County E.C. propose taking over the Halesowen Grammar School, and to carry out extensions which are estimated to cost from £18,000 to £20,000. Plans are also to be submitted to the B.E. for a new Secondary School at Malvern.

YEovil.—Yeovil T.C. heard recently that a deputation had waited on the M.H. with regard to the Council's proposal to carry out the erection of 296 houses in Preston Road. The Ministry would be prepared to authorise the Council to proceed at once with the construction of 150 houses, and, subject to satisfactory progress being made, would give favourable consideration to an application by the Council in July next for sanction to erect the remaining 146. Sanction had since been received from the Ministry to the raising of loans for £70,000 for the erection of 150 houses, and of £13,390 and £2,910 for the construction of roads and sewers in connection with the complete scheme. A firm were prepared to enter into a contract for the erection of 296 houses for £132,218, or 150 houses for £69,138. The Council decided to seal the contract.

Building Contracts Open

*** It is requested that information concerning Contracts Open, Tenders, etc., be forwarded to Robinson House, 2 Breems Building, London, E.C.4, not later than 2 P.M. on Tuesdays. The date given at the beginning of each paragraph is the latest date when the tender or the names of those willing to tender, may be sent in the name and address at the end is the person from whom quantities, forms of tender, etc., can be obtained.*

ALDERSHOT.—March 14.—For the erection of 60 flats in 15 buildings in two types, each type to be tendered for separately. Mr. J. W. Hipwood, Assoc.M.Inst.C.E., Borough Engineer, Tuns Gate, Guildford.

BIRMINGHAM.—March 10.—For the alterations and additions to "Lordswood," 44 Lordswood Road, Harborne, for the Birmingham B.C. The offices of the architects, Messrs. Martin & Martin & Ward, 106 Colmore Row, Birmingham. Deposit £2 2s.

BRIGHTON.—March 16.—For the erection in brick of 60 houses on the Whitehawk Valley housing site, East Brighton. The office of the Borough Engineer and Surveyor, Mr. I. Edwards, M.Inst.C.E., F.S.I., Town Hall, Brighton. Deposit £1.

BRISTOL.—March 5.—For the erection of boundary wall and railing at Canford Cemetery, Westbury-on-Trym. Lessel S. McKenzi, M.Inst.C.E., City Engineer and Surveyor, 63 Queen Square. Deposit £2 2s.

BRISTOL.—March 14.—For the construction in brick work, with slate roof, etc., of the additional offices adjoining the existing Customs House at Avonmouth. Thomas A. Peace, Engineer, Port of Bristol Authority, Chief Engineer's Office, Avonmouth Dock. Deposit £3.

BURY.—February 28.—For the erection and completion of 200 houses of eight types upon land adjoining Hornby Street, and 24 houses of two types in White Street, Buller Street and Kitchener Street, adjoining the Bolton Road Housing Scheme, within the borough. Mr. J. Ainsworth, Settle, the Borough Engineer, Bury Street, Bury. Deposit £5.

CAITHNESS.—March 5.—For mason, carpenter, slater, plumber and plaster works of police constables' houses to be erected at Halkirk and Dunbeath. Sinclair Macdonald, Architect, Thurso.

*The most beautiful interior
is at the
mercy of
the ROOF*

*An artistic variation of
Turners' Tiles is the
"Enduro" pattern, made
in rich Russet-Brown.
Nett cover area 20" x 12"*

*"Permanite" Slates are
made in the following
colours: Grey, Red, Blue,
and Russet-Brown.*

*Rectangular Sizes:
24" x 12", 16" x 8"*

On the quality of the roofing material depends the protection of the rooms beneath. On the score of quality it is impossible to do better than choose "Permanite" Slates or "Enduro" Tiles.

These are made to provide positive weather protection, year after year, to defy the efforts of sun, rain, frost and wind and to keep their appearance as long as the house stands.

THE TRUSCON FLOOR

IN REINFORCED CONCRETE

Administration Block for Macfarlane Lang & Co., Ltd., Glasgow.

Architect: Ernest Monro (J. M. Monro & Son).

Contractors: John Train & Co., Ltd.

TRUSCON FLOORS WERE CONSTRUCTED THROUGHOUT.

BEFORE PLACING YOUR FLOORING CONTRACTS CONSIDER
THE ADVANTAGES OFFERED BY THE TRUSCON FLOOR

It is the primary duty of a floor to carry efficiently the loads which may come upon it. Of the other duties of a floor the least spectacular but the most useful is that of accommodating the "domestic services." The Truscon floor will do this.

Most buildings require gas and electric light, electric bells, telephones, and water supply. Heating systems, either radiator or "panel," have to be allowed for, and sprinklers or ventilating systems are often required. The Truscon floor has an accessible hollow space in which all these services can be effectually concealed.

THE TRUSSED CONCRETE STEEL CO. LTD.

REINFORCED CONCRETE ENGINEERS

22 Cranley Gardens, South Kensington, S.W.7

Engineer and Surveyor, Manchester. G. A. Russell & Son (subject to approval).

HIGHBRIDGE.—The U.C. have accepted the tender of Mr. E. Gullidge for the erection of 36 houses, parlour type, for £15,190 13s., and £586 for road work.

Tenders

Messrs. W. H. Brown (Leatherhead), Ltd., inform us that their tender submitted for a housing scheme at Cobham, Surrey, was £18,201, and not £14,201, as stated in our issue of February 18.

Department of Overseas Trade

The Officer-in-Charge of the office of His Majesty's Trade Commissioner at Winnipeg (Mr. A. M. Wiseman, M.C.) reports that a local firm is desirous of being placed in touch with British manufacturers of tiles, sanitary ware, steel sashes, floorings and builders' hardware and similar lines in connection with the erection of an auditorium at Winnipeg. The enquirer also wishes to be placed in touch with manufacturers of materials the use of which improves the acoustics of buildings. British manufacturers interested in the enquiry can obtain further particulars upon application to the Department of Overseas Trade, 35 Old Queen Street, London, S.W.1. Reference No. BX. 3261 should be quoted.

WIRING THE HOMES OF BRITAIN

This successful E.D.A. Campaign will depend for its lasting and continuous effect as a piece of propaganda on satisfied customers. Reliable wiring is the first consideration

'C.M.A.' CABLES should be used where the *best obtainable* is specified

Reg. Trade Mark No. 422219-20-21

'NONAZO' CABLES can be adapted where price must be considered, but sound work is essential

Reg. Trade Mark No. 458865

The Campaign will get the Customers; do not lose them by using "just as good" cables

A.A.S.T.A. Visit to Provence

The success of the A.A.S.T.A. visit to Rome and Florence last year has encouraged the Council to undertake a further visit at Easter in 1927. This year the venue has been changed to Provence. In addition, the visit will be extended to Marseilles, from which a visit will be paid to Hyeres. A provisional programme has been arranged, and the following particulars are already available:—

April 7 to 18.

April 7 (Thursday), leave London 8.20 p.m.; April 8 (Friday), arrive Avignon 19.44 (7.44 p.m.); April 9 (Saturday), visit to Orange; April 10 (Sunday), Avignon; April 11 (Monday), visit to Nimes; April 12 (Tuesday), visit to Arles; April 13 (Wednesday), Avignon; April 14 (Thursday), morning, Avignon; leave Avignon 19.57 (7.57 p.m.), arrive Marseilles 21.45 (9.45 p.m.); April 15 (Friday), Marseilles; April 16 (Saturday), visit to Hyeres; April 17 (Sunday), Marseilles; leave Marseilles 19.15 (7.15 p.m.); April 18 (Monday), arrive Paris 8.40, leave Paris 10.36, arrive London 18.43 (6.43 p.m.).

Art and Industry

The Board of Education are arranging for a short course for teachers in recognised art schools in England and Wales who desire to refresh, or extend, their knowledge of matters pertaining to their work, more particularly in regard to the application of art instruction to the requirements of industry. Full particulars from The Secretary, Board of Education, Whitehall, London, S.W.1.

Obituary

We regret to announce the death of Mr. Jesse Sanders Brown, one of the directors of G. A. Harvey & Co. (London), Ltd. He had been connected with this company for over forty years.

Institution of Municipal and County Engineers

The Richard Pickering Prize will be awarded by the Council of the Institution of Municipal and County Engineers at intervals of one year, the funds being provided by the legacy left by the late Richard Pickering (Member of the Institution), Borough Surveyor of Whitehaven. The prize (of a total value of fifteen guineas) will consist of ten guineas and the Richard Pickering Gold Medal, and is offered for a thesis on a subject selected by the Council of the Institution and announced at the annual general meeting. The subject for the year 1926-27 is: "Road Economy from the Traffic and Maintenance Point of View." The thesis is to consist of not more than 5,000 words, to be typewritten on foolscap, one side only, and to be illustrated by drawings or sketches. It must be delivered on or before March 31, 1927, addressed to the Secretary of the Institution of Municipal and County Engineers, 92 Victoria Street, S.W.1. Detailed regulations will be found in the Handbook.

Professional Note

Mr. Lionel F. Vanstone, of 15 Old Town Street, Plymouth, has opened an office at Midland Bank Chambers, Palace Avenue, Paignton.

Trade Notes

Messrs. J. Blakeborough & Sons, Ltd., have acquired from "Nuswift" (Bradford), the sole manufacturing and selling rights of the "Nuswift" Patent Fire Extinguishers. The services of Mr. J. A. Goodall—the patentee—have been retained, and business will in future be dealt with at the works of J. Blakeborough & Sons, Ltd., Brighouse, to which address all communications should be forwarded.

Trade Catalogues Received

"Ferrocrete Bulletin," Number 5, February (Portland House, Tothill Street). The first issue of a periodical entitled "Ferrocrete Bulletin" has been published for free distribution by the Cement Marketing Co., Ltd. This brochure is intended as a medium for familiarising cement users and merchants with the types of work for which "Ferrocrete," the rapid-hardening Portland cement, is being used, in order that those interested in building may keep abreast with the latest methods of rapid construction.

Shell Mex, Ltd., Kingsway, London, W.C.2. Central heating with fuel oil, widely used in America, has in the last few years been extensively adopted in this country for public buildings, hotels, and large business houses generally. The purpose of this booklet is to show that the success attained in these installations points the way to its adoption on a much larger scale for smaller buildings and the larger type of private dwelling.

On Quantities

Quantity Surveyor: But why are you always so keen on "Vulcanite" for roofing?

Architect: I study my clients' expenditure as well as my own reputation.

Quantity Surveyor: But is it really cheaper?

Architect: It certainly is! Not only is the initial outlay less, but its durability is far greater than any other roofing material.

Quantity Surveyor: Then it is positively economical and satisfactory in every way?

Architect: Absolutely! I can always recommend it with complete confidence, knowing it will give perfect results.

Quantity Surveyor: Fine. Then I'll get busy and include "Vulcanite."

"VULCANITE" roofing is used under the London Building Act and the Bye-laws, etc., of all Borough and Urban District Councils; and is accepted by all the leading Fire Insurance Companies as an Insurance Tariff Roof

We shall be pleased to have your request for our Illustrated Booklet, and to supply detailed drawings and estimates free.

LONDON PRIDE

The fact that we took strong exception to the London County Council's proposal to demolish Waterloo Bridge does not blind us to much excellent and enlightened work which that body does in many directions for London's welfare. It has been so often, in artistic matters, "on the side of the angels" that one must not dwell too long or too seriously on that one grave lapse, which, probably, was rooted more in vague, financial fears than *malice prepense*. The difficulty of keeping up a reputation becomes, sooner or later, a tax upon ones mental processes, as well as a serious hindrance to definite action. The Council, in recent years, seems to be showing some signs of such strain. In its early years, it exhibited a more healthy disregard for compromises and makeshifts; and in its determination to sweep London clean, embodied as vigorous a specimen of new broom as any contemplated in the old adage. That attitude resulted in the cleaning out of a good part of the Augean Stable of the Metropolis; and we have a somewhat wistful regard for those free, unfettered "spendthrift" days which now are becoming but a memory. We are no advocates for, in popular parlance, "chucking the money about"; but the majority of the Council are rather apt to regard expenditure on improvements with the niggardly eyes that Parisian shopkeepers directed towards the schemes of Haussmann and Napoleon III, forgetting that five hundred millions have been returned to the Parisians for every five millions wrung out of their hardly-earned incomes. It is the timorous spirit that brings about troubles like the Waterloo Bridge dispute, where fear of probable cost made the Council shy at putting a new bridge where it was badly needed, and compromise on erecting a wider bridge where width would have proved an intolerable nuisance. That difficulty has, we hope, been solved. Yet the financial solution of this difficulty, for which, we presume, we are largely indebted to Sir William Plender, might just as well have been suggested originally by the Council, which was as well aware, as anyone, that London, on the basis of population, had never had its fair share of the Road Board funds. In many ways, we think the Council might try to lead public opinion instead of waiting for it to become articulate. We doubt not, for instance,

that if the Council had built up Kingsway and Aldwych on a fine design, and taken both the rack rents and rates, it would have done better artistically and financially for London than by letting private enterprise haggle with it for a quarter-of-a-century over the development. We do not doubt, either, that if it came forward with a proposal to buy out the Foundling Hospital spaces, or even the whole estate, it would find all the public backing it required; and if it promoted a measure to sterilize from building all other London squares and open spaces, the citizens would not hesitate in giving endorsement to the policy.

The Council does its work mainly through committees. As a method of procedure, this has its dangers; but the most casual glance at Council meeting agenda, those fat books of accumulated minutiae, which come up for ratification on Tuesdays proves, not only the immense ramifications of London's governance, but the impossibility of dealing with it in any other way. Still, if the committees sometimes lose their way in the tangled undergrowth of detail, we look to the full Council to preserve sufficient detachment to see the wood as a whole and discern a clear path of policy through it.

In its early days, the Council maintained a somewhat conscious austerity and disdain for civic pomp and the baubles of office. It has now so far progressed as to succumb to the lure of an official badge for its Chairman, a generous present from Major Lewis-Barned, one of the members. This may occasion heart burnings in some quarters, but the innovation is to be commended. The head of any public authority should bear on occasion some distinguishing sign of his office; and it is notorious that, in the past, L.C.C. Chairmen and distinguished guests of the Council, have often experienced awkward moments for lack of it. This badge, of gold, brilliant and enamel, is doubtless a pretty thing. The Council's coat-of-arms figures on it, but we are more rejoiced that it includes also a presentment of that humble plant known as London Pride. As a silent symbol of the spirit that should ever animate the head of London's County, this ubiquitous growth of its gardens could not have been bettered; and we doubt not that this motto will animate L.C.C. Chairmen in the future as much as in the past.

Notes and Comments

Registration

OSXOI

The past week has seen another protest against the Registration Bill, this time from Prof. Beresford Pite, who detects in it an attempt "to penalise the free practice of the universal art of architecture," whereas the Bill does nothing more than penalise the free and unrestricted appropriation of the title of architect by people who have never attempted to train or fit themselves for that profession. The "unauthorised architecture (often spontaneous and noble) of engineers, builders and surveyors," which the Professor mentions, will still go on; if we had savages in these islands, they would, despite the Registration Bill, still be able to construct their mud and wattle huts, if the bye-laws permit. What the Registration Bill aims at is that those who profess and call themselves architects shall be led into the way of truth. Prof. Pite has had a long connection with the training of architects; does he now contend that training is not required? The layman has no need to go to an architect for knowledge of construction; the engineer can give him that, or the builder, or many of the surveyors. If he goes to the architect, he expects something more than a knowledge of the science of building; but the Professor, apparently, sees no reason why he should have any expectation of getting it. Illness would mean an added, intolerable anxiety if the doctor's brass plate was an enigma that might mean much or nothing if the trained man and the quack were equally entitled to the same honourable title. One rejoices that there is a General Medical Council to register the fact that the doctor we call in has reached a certain stage of qualification through study. He may not be a genius, but even "a legal standard of mediocrity" will often suffice to pull us through. The true doctor's education, however, is never finished; nor is the true architect's. To cultivate an architectonic mind means a far longer and more difficult training than the assimilation of scientific facts which forms the basis of the healing art. Yet Prof. Pite would debar us from any assurance that it had even been begun.

Chelsea

From recent reports, Bloomsbury is not the only district of London in danger of losing part of its cherished open spaces, for Mr. Reginald Blunt, in *The Times*, has drawn attention to a possible scheme for building on part of the grounds of the Duke of York's Headquarters. The proposal is being tentatively considered by the Army Council, which requires to find accommodation for certain anti-aircraft units of the Territorial Force. Apparently a site for this accommodation has already been purchased in Rochester Row, but the fiat of economy has gone forth, and second thoughts suggest the selling of the purchased site and the erection of some light buildings on the open ground at the Duke of York's Headquarters. The qualification of lightness no doubt implies a temporary character—to last until brighter financial days shall dawn—but if the buildings ever go up we shall not doubt their permanency. The Chelsea Council know nothing officially and are not likely to do so, since Government plans are not submitted or subject to their approval. It is well, therefore, that public opinion should be aroused on the subject, and that it is made clear to the Government that lip-service to the principle of preserving London's open spaces does not condone their destruction by Government departments. The need for economy is urgent; but economy at the expense of light, air, and health is folly. "Economy! What

crimes are committed in thy name!" will soon become a new variant of an old tag.

Southend Architects

A new Society of Architects for Southend and District was inaugurated at the local School of Arts and Crafts last week, when Sir Charles Nicholson delivered his first Presidential address and Major Harry Barnes gave an official welcome to the new body on behalf of the Royal Institution. We may also be allowed to offer our felicitations to the Society, and to express the hope that it will grow both in size and authority for the good of the art which it is designed to foster. It is curious to reflect that few of the rapidly expanding communities a short way out of the Metropolis have any organisation of local architects to influence the character of the numerous buildings that are being erected. In Southend, which like all coastal places is in danger of an epidemic of "seaside" architecture, the remedying of the omission is doubly valuable. In recent months we can claim credit for having induced a Southend layman to discard a builder's very bad design for a house and seek professional advice in his district, with results that gave much satisfaction to the client and, incidentally, to ourselves. For that the profession in Southend may regard us with a friendly eye. If they but knew what Southend has been spared!

Window Dressing

We are beginning to appreciate the great importance of sales organisation in modern industry, and the fact that the production of a good article can do little to increase trade unless the article is presented in such form and under such conditions as will make it appeal forcibly to the possible purchaser. From his close study of industry in many lands, the Prince of Wales, at the recent British Industries Fair Banquet, was able to point a moral with a tale of an Argentine native, who passed over a tin of British paint for one of German manufacture because the "directions for use" on the British tin were given only in English, which neither buyer nor storekeeper understood; whereas the painstaking German printed his directions in Spanish. That is one vital point in foreign trading; there are others of moment, whether in selling at home or abroad, and among these is the manner in which goods are displayed to the public. In this matter, the manufacturer is largely in the hands of those who retail his wares; but the sales organisation side of a progressive firm will make it their business to encourage the retailer to present their firm's goods in the most attractive and appealing manner. The Prince's story about paint reminds us that an interesting window dressing competition has been instituted by an important firm of paint manufacturers, who offer valuable prizes for the best window display of their numerous products. This should interest builders, builders' merchants, and other readers who handle this firm's goods; and we draw particular attention to it because we believe the organisation of the competition is, in some measure, due to a suggestion made by us. How competitors dress their windows is left to their discretion, but the results will be adjudged on the selling power, originality, workmanship, and showcards and tickets in the display. The competition, which commenced on March 1 and will continue until April 15, has been promoted by Messrs. Robert Ingham, Clark & Co., Ltd., and its associate firm, Messrs. R. Gay & Co., Ltd. All those desiring to compete should apply for entry forms and particulars to the first-named company at West Ham Abbey, London, E.15.

Latest Competition Results

The past few days have brought the results of four important Competitions. In those for a new Academy at Perth and for remodelling and extending the Victoria Hospital, at Blackpool, the final assessments have been made, and the premiated designs in each case are illustrated and commented upon in this issue. In the third Competition, for designs for the extension of the Manchester Town Hall, the preliminary competition has resulted in the selection of six firms of architects, whose names are given below, to submit designs for the final assessment.

The result of the fourth competition, for alterations and extensions to the Herefordshire General Hospital, was received at the moment of going to press: names of successful Architects are given below.

New Academy, Perth

The assessor, Mr. James D. Cairns, has made the following awards in the competition limited to architects in practice in Scotland for the proposed new Academy at Perth:

- (1) Mr. T. Aikman Swan, A.R.I.B.A., 7 St. Colme Street, Edinburgh.
- (2) Messrs. Meston & Stewart, 38 High Street, Lanark.
- (3) Mr. James Millar, F.R.I.B.A., 15 Blythswood Square, Glasgow.

The Victoria Hospital, Blackpool

In the competition for the remodelling and extension of the Victoria Hospital, Blackpool, the assessor, Mr. H. Percy Adams, F.R.I.B.A., has made awards as follows:

- (1) Messrs. Gibson & Gordon, 5 Old Bond Street, London.
- (2) Messrs. Saxon Snell & Phillips, 9 Bentinck Street, Manchester Square, London.
- (3) Messrs. Adshead, Topham & Adshead, Manchester.

Manchester Town Hall

The following architects have been selected to submit their designs to the assessors in the competition for designs for the Manchester Town Hall extension:

Messrs. Bradshaw, Gass & Hope, Bolton.
 Messrs. Colclutt & Hamp, London.
 Mr. J. F. B. Cowper, London.
 Mr. Harry S. Fairhurst, London.
 Mr. E. Vincent Harris, London. }
 Mr. E. Berry Webber, London. }

On completion of their designs the above architects will be entitled to a fee of £500 each. It is expected that some time will elapse before a start is made with the building of the extension, which will probably cost £1,000,000. This is Mr. Berry Webber's second success in competitions promoted by the Manchester Corporation. With his design for a new art gallery on the Piccadilly, Manchester, site, he secured the premium award of £500.

Herefordshire General Hospital

The following is the award made by Mr. C. E. Elcock, F.R.I.B.A., the Assessor appointed by The Royal Institute of British Architects in the competition for alterations and extensions to this hospital:

- (1) Messrs. Adams, Holden & Pearson, Knightsbridge, London.
- (2) Messrs. William & T. R. Milburn, Sunderland.
- (3) Messrs. Knott, Collins & Snell, Adelphi, London, W.C.2.

THE PERTH ACADEMY COMPETITION

It is not often that a new school can be erected upon such an ideal site as that provided by the Education Authorities of Perth. In this instance the competitors were required to place their building on a large rectangular site, with public roads on two sides of it, and having the ample dimensions of 1,020 ft. by 650 ft., so that there was plenty of room for playgrounds in immediate association with the building.

Before examining how the competitors took account of these circumstances, it may be well to glance at the conditions of competition and instructions to competing architects in order that the architectural "programme" may be understood. In the first place, it may be mentioned that these conditions were drawn up by Mr. James E. Cairns, architect, of Edinburgh, who was also appointed assessor of the com-

petition, which was limited to architects in practice in Scotland and carrying on business on their own account. In his award he placed Mr. T. Aikman Swan, A.R.I.B.A., first, Messrs. Meston & Stuart second, and Mr. James Miller third. The schemes submitted by these three firms are illustrated by the accompanying photographs.

It was pointed out that competitors, while invited to express the most modern ideas in school design, were under obligation to study the special building regulations for schools issued by the Scottish Education Department. The cost of the building, including drainage, water, gas, electric fittings, roads and footpaths, boundary fences, and the formation and division of playing fields, was fixed at a maximum of £55,000. For this sum the competitors were required to provide 24 ordinary class-rooms, 3 chemical and

PERTH ACADEMY COMPETITION: SECOND PREMIATED DESIGN.
MESSRS. MESTON & STEWART, Architects.

physical laboratories with necessary store rooms attached, and a large demonstration or lecture room for scientific subjects. In addition, two art rooms, one craft room and one room for manual instruction, four music rooms, and rooms for the teaching of cookery, laundry work and needlework were to be provided. The central element and as it were the focus of the whole scheme was to be the large assembly and luncheon hall. Great importance was also attached to the gymnasium for both boys and girls; well-planned dressing-rooms and bathrooms were to be associated with it. The administrative quarters include a detached Janitor's house, private rooms for the Rector, Secretary and Lady Superintendent, and a medical inspection room, while, of course, adequate cloakroom and lavatory accommodation was considered essential.

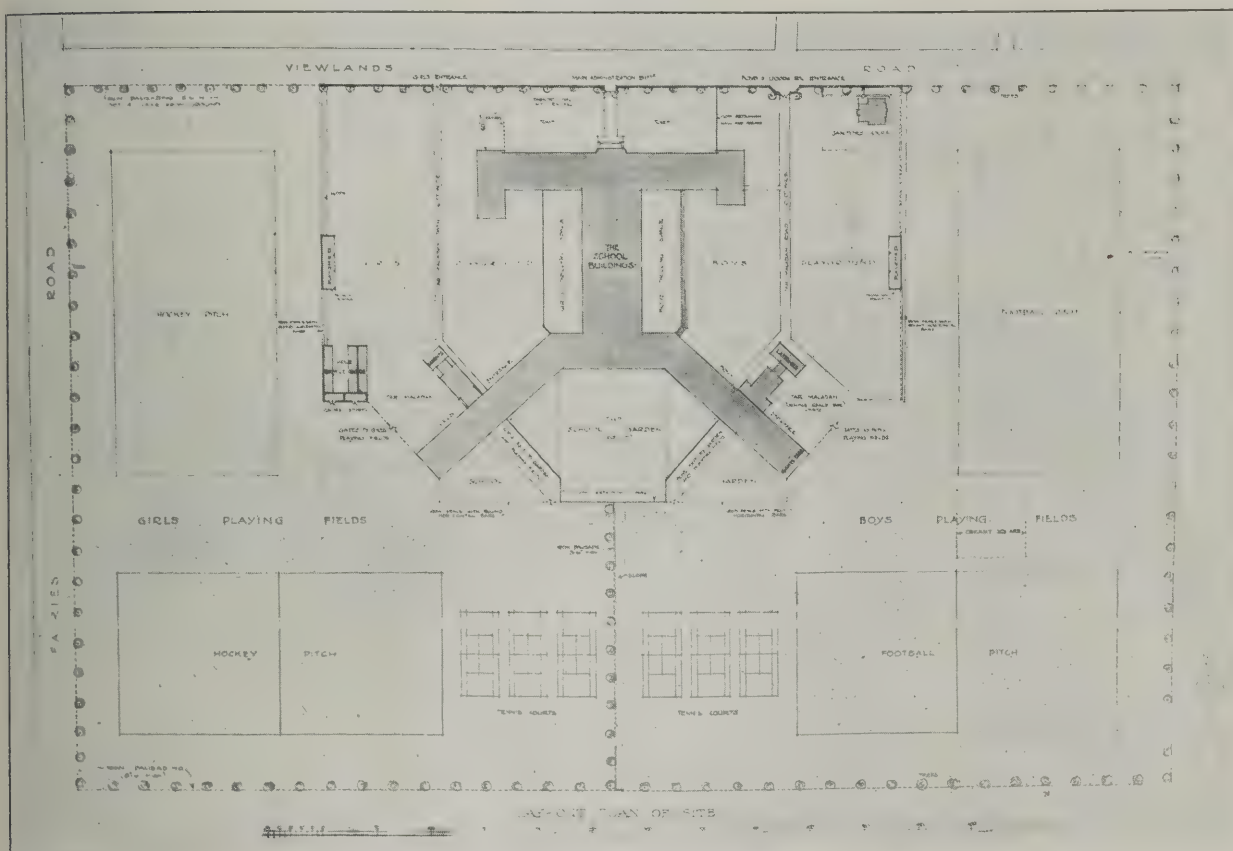

Let us first examine the plans and consider their relation to the site. It has already been observed that the ground slopes considerably from the North to the South, and this natural circumstance points to the desirability of avoiding an axis normal to the slope of the ground and having on each side of it a symmetrical formation of buildings which are obliged to have their bases at different levels. This particular axiality, however, is exactly what has been adopted in the second premiated design, which shows a star-like pattern having elongated blocks set diagonally at each corner and forming a repetitive geometric pattern which takes no cognizance of the slope of the ground. In the designs placed first and third, however, we see that this elementary inflection has been achieved, and the disposition of the blocks aligning on Viewlands Road on the North is markedly

different from that which faces the southern boundary of the site. This seems to be a necessary factor in the correct expression of the lay-out, for not only does it ensure that the contour of the ground is suitably recognised, but it enables the group of buildings to have a specially prepared front elevation towards the principal approach, which is considered to be Viewlands Road. It is not altogether desirable that the position of the public thoroughfare should be so entirely disregarded as it is in the design placed second, which appears to have the further blemish that the main entrance to the building is placed on an elevation which to all intents and purposes is exactly duplicated at the rear of the building. Another advantage which the designs placed first and third have over this latter is that they take more account of aspect and provide for a larger proportion of the class-rooms to face south. Yet all three plans have considerable merit from the utilitarian point of view and show that the competitors have studied the "programme" with very great care.

Let us analyse some of the special excellences of Mr. T. Aikman Swan's design. In his report the assessor points out that this design is superior to most of the others submitted in that it has no closed-in courts or areas, which, he points out, may be unavoidable were the site very restricted, but which are undesirable in any circumstances. Alone of the three premiated designs, Mr. Swan's has the assembly hall on the first floor, with the gymnasium underneath. This is a highly satisfactory arrangement, inasmuch as it enables drill spaces to be provided in the open air on either side of the gymnasium, while the dressing-rooms associated therewith are readily accessible from

the playing fields. All the class-rooms have cross ventilation and the corridors are ventilated by large side windows. The administrative part of the building is placed near the entrance on the north façade, while the boys and girls are provided with separate entrances at the centre of each of the projecting wings to the south of the building.

In the scheme submitted by Messrs. Meston & Stewart, the assembly hall is on the ground floor and is equally accessible from the main entrance towards Viewlands Road and the boys' and girls' entrances on the east and west sides respectively. These latter are very cleverly placed in blocks which contain cloak-rooms and lavatories and which are united by short corridors not only to the assembly hall, but to the principal rooms of the building. As far as communications go, this plan is excellent, and as most of the windows on the interior courts belong to corridors and apartments other than class-rooms, it cannot be said that in this instance the requirements of light and air have been unduly sacrificed to the means of communication. In the design by Mr. James Miller it must be confessed that the interior court contains a row of class-rooms facing North, and this arrangement cannot be defended. It is also apparent that access to these particular class-rooms from the boys' and girls' entrances is not very conveniently managed.

The elevations are of considerable interest. As was to be expected, the north and south façades, owing to their symmetry, present the most formal aspect. In the winning design the north front has a pleasing central feature with main entrance, which is supported on either side by end pavilions separated from it by intermediate portions of wallage. The appear-

ance of these latter is somewhat spoilt by the too marked duality of the rows of windows, which the designer has done nothing to mitigate, and a similar blemish is noticeable in the south façade. The west and east elevations show an interesting group of buildings properly dominated by the assembly hall.

Messrs. Meston & Stewart's design has symmetry upon all fronts, but, as was previously mentioned, the marked slope of the ground renders this symmetry on the east and west elevations inappropriate. The façades, however, have an admirable breadth and simplicity and very well express the function of the building.

The third premiated design differs from the other two in that the main entrance of the building is placed on the south side. This entrance is marked by a central pavilion surmounted by a stone cupola, which, however, is not very intimately connected with it, being placed on the ridge of the roof behind it, while it must be observed that this feature has the effect of cutting the competition in two rather than of providing a suitable dominant for it. There is no doubt, however, that this competition has been well justified in that it has called forth designs in which a highly complex architectural programme has been fulfilled with no small measure of success, and it has helped the art of school planning to a distinct advance.

Reference must also be made to the liberal provision of playing fields, in which football, cricket, hockey, lacrosse and tennis grounds are included. There can be no doubt that the Perth Secondary School will be one of the best equipped in the kingdom.

Competition Notes

Bradford Grammar School

The Governors of Bradford Grammar School invite designs from architects for a proposed new school. Premiums of £300, £200, and £100 are offered respectively. Mr. Arnold Mitchell, F.R.I.B.A., assessor. Particulars and plan of site from Mr. W. Brear, The Grammar School, Bradford, Yorks. Deposit £1 1s.

Bradford Improvement Scheme

The committee of the Corporation Street Improvement and Buildings Committee will shortly, it is stated, consider a proposal to promote a competition among architects for the best plans for the lay-out of the whole of the central area of Bradford and the construction of new buildings. The official suggestions provide for the construction of three or four new thoroughfares—the principal one between Town Hall Square and Forster Square, running parallel with Market Street. No public buildings are stated to be included in these official ideas. If they become the basis for future development, the new streets will consist almost entirely of shops, with offices and warehouses above them.

School of Lytham St. Anne's

The Governors of the Lytham Charities invite architects who have had experience in the design and erection of schools to submit their names in a competition for a Girls' Secondary school at Lytham St. Anne's, to Messrs. Wilson, Wright, Davies & Earle, 54 Moseley Street, Manchester, by March 12. From the names submitted a selection of twelve architects will be made, to whom invitations will be issued.

Bognor Council Offices

The Council invite architects to submit their names before March 16, 1927, to Joseph Jubb, Clerk's Office, Bognor, Sussex, as being willing to enter for a limited competition for the erection of Council offices, and have appointed Mr. Septimus Warwick, F.R.I.B.A., to act as assessor.

Manchester College of Technology

In connection with the competition for the extension of the College of Technology, the Corporation have accepted the following nominations of the President of the Royal Institute of British Architects for the assessors: Messrs. Henry M. Fletcher, 2 Gray's Inn Square, London; Francis Jones, 178 Oxford Street, Manchester; and Alan E. Munby, 9 Old Square, Lincoln's Inn, London.

Lexden Council School Competition

The conditions of this competition are not in accordance with the published Regulations of the Royal Institute for Architectural Competitions.

EXHIBITION OF ARCHITECTS' WORKING DRAWINGS.—The R.I.B.A. state that in the forthcoming Exhibition of Architects' Working Drawings the name of Mr. Walter Tapper, A.R.A., F.R.I.B.A., should appear in the place of Mr. Michael Tapper, A.R.I.B.A.

PAPERS ON "MODERN HOSPITAL PLANNING."—The sessional papers announced for the R.I.B.A. General Meeting on Monday, May 16, 1927, are two papers on "Modern Hospital Planning"—one on "English Hospitals," by Mr. H. Percy Adams, F.R.I.B.A., and one on "American Hospitals," by Mr. Lionel G. Pearson, F.R.I.B.A. In view of its importance and of the large amount of material available on the subject of hospital planning, it has now been decided to devote the meeting on May 16 to one paper on

"Foreign Hospitals," by Mr. Pearson, and to defer the reading of Mr. Adams' paper until next session.

Incorporation of Architects, Scotland

The monthly meeting of the Council of the Incorporation of Architects in Scotland was held recently at 15 Rutland Square, Edinburgh, Mr. G. P. K. Young, F.R.I.B.A., the president, in the chair. A report was submitted as to what had been done in the proposed formation of a council for the preservation of rural Scotland. There were elected one fellow, five associates, and two students. It was decided to formulate standard rules and regulations for the Chapter. Four representatives were nominated for the R.I.B.A. Council for the ensuing year.

Sir John Soane's Fund

The annual meeting of the Trustees of Sir John Soane's Fund will be held at the Museum, 13 Lincoln's Inn Fields, London, W.C.2, on Wednesday, March 9. They will then proceed to allocate the interest (about £150) accrued during the year on the capital sum left by Sir John Soane as an anniversary gift for the relief of distressed architects, their widows and children.

Coming Events

The Royal Institution of Great Britain.—Friday, March 4.—Sir Herbert Jackson on "Some Colouring Agents in Glasses and Glazes." 21 Albemarle Street, W.1. 9 p.m.

The Bristol Society of Architects.—Friday, March 4.—Mr. Bernard Cayley, F.R.S.A., on "Modern Paintwork."

Birmingham Architectural Association.—Friday, March 4.—Members' Meeting.

The Surveyors' Institution.—Monday, March 7.—General Discussion on "Leasehold Reform." 8 p.m. 12 Great George Street, Westminster, S.W.1.

Edinburgh Architectural Association.—Wednesday, March 9.—Mr. George L. Peplar on "Regional Town Planning."

The Liverpool Architectural Society.—Wednesday, March 9.—Mr. H. L. Beckwith, F.R.I.B.A., on "Visit to Schools in Holland and Belgium."

Manchester Society of Architects.—Wednesday, March 9.—Mr. Harry S. Fairhurst, F.R.I.B.A., on "Notes on a Visit to America."

Sheffield, South Yorkshire and District Society of Architects and Surveyors.—Thursday, March 10.—Mr. F. R. Yerbury on "Some Modern Building Abroad."

The Geffrye Museum.—Thursday, March 10.—Mr. Frederick Litchfield on "English Furniture, 1770-1810." 7.30 p.m. Kingsland Road, Shoreditch, E.

Sheffield, South Yorkshire and District Society of Architects and Surveyors.—Thursday, March 10. (To be announced.)

Edinburgh Architectural Association.—Monday, March 14.—Annual General Meeting of Association Section.

The Royal Institute of British Architects.—Monday, March 14.—Mr. Howard Robertson, F.R.I.B.A., on "Modern French Architecture." 8 p.m. 9 Colindale Avenue, London, W.1.

Town Planning Institute.—Wednesday, March 15.—Alderman E. G. Culpin on "Decentralisation." 6 p.m. Caxton Hall, Westminster, S.W.1.

Birmingham Architectural Association.—Friday, March 18.—Mr. W. H. D. Caple, F.R.I.B.A., on "The Annual Excursion to Laon."

The Royal Technical College Architectural Craftsmen's Society.—Friday, March 18.—Business Meeting. Mr. W. McCrae on "Architecture and Acoustics." 7.45 p.m. Glasgow.

Manchester Building Trades' Exhibition.—March 29-April 9.—Particulars from Provincial Exhibition Ltd., City Hall, Manchester.

ST. ALPHEGE, GREENWICH.
NICHOLAS HAWKSMOOR (1661-1736), Architect.

“NICHOLAS HAWKSMOOR: A LONDON ARCHITECT”

Considerable doubt has always surrounded the authorship of many of the most conspicuous buildings of the last four centuries. In many cases this is inevitable, and due either to insufficient, or an entire absence of contemporary records. Thus came about the literary enthusiasm about John Thorpe, and since there was no evidence (or very little) either way, there was a time when it would seem that Thorpe had been responsible for an almost impossible number of buildings of that type associated with his name. A similar opinion has existed of the work in the manner of Inigo Jones, an opinion which has been responsible for attributing to that master more buildings up and down the country than would be in the power of any one man, even with an enormous staff of assistants, to design. Thus, as a contribution to the history of Architecture, any one careful study of any one architect is bound to have a considerable value. It is from the study of the assistant, who existed in the 17th century just as surely as he does to-day, that we are likely to learn the most. Mr. Avray Tipping, in the above Paper, read before the London Society on February 18, has made a masterly study of such an assistant, and an assistant who worked in the offices of men like Wren and Vanbrugh, two of our greatest and most original architects. As “domestic clerk” and then as an official of the Office of Works, he assisted Wren throughout the busiest years of his activities. He was also an assistant who “did jobs on his own,” but the general opinion is that he was less efficient as a creator than as a highly trained and fully informed assistant. In this capacity he was undoubtedly of great value to Wren and Vanbrugh, more, thinks Mr. Tipping, to Vanbrugh than to Wren, for it was in Wren’s office that he must have learned much that he ultimately knew. Born in Nottinghamshire in

1661, we are told that he entered Wren’s office at the age of 19. Wren was then in his official capacity of Surveyor to the Office of Works, and busy with St. Paul’s and the City churches, the Palaces of Winchester and Kensington, and the hospitals of Greenwich and Chelsea. In 1689 William the Third bought Nottingham House, and consulted Wren about its alteration and enlargement. From that date the name of Hawksmoor appears on the paybooks of the office as Clerk of the Works, and remains there until 1715, when he became Clerk of the Works at Whitehall, St. James’s, and Westminster. In the meantime, however, he had become connected with Greenwich, being appointed Clerk of the Works to the Hospital in 1698, and Deputy Surveyor in 1705. Wren remained at the head of the Office of Works until 1718, and was thus Hawksmoor’s official chief until then; but he does not appear to have been closely connected with much of Wren’s work or subject to his influence after his association with Vanbrugh. “When and how did that begin? That is, how could Vanbrugh detach Hawksmoor from Wren and yet a friendly feeling prevail?” It has been suggested that Vanbrugh, moving in the same society as Wren, interested in architecture, and meeting men Wren was likely to meet, possibly made friends with Wren himself in William the Third’s time. Sir Christopher, possibly amused at the young man’s fine ideas about architecture, was at least interested enough to give him the freedom of his office, to urge his appointment to the Comptrollership of Works in succession to Talman, and to put him into relations with Hawksmoor. “May not Wren, a generous and broad-minded man, have seen that the qualities and defects of these two men were in the way of their achieving much alone but promised great success in combination? This is not only an interesting surmise, but a probable one.”

ST. GEORGE'S-IN-THE-EAST: THE WEST FRONT.
NICHOLAS HAWKSMOOR (1661-1736), Architect.

In the summer of 1699 plans for Castle Howard were being shown to such people as the Duke of Devonshire and the Earl of Manchester. Later, a model in wood was made, which, as Vanbrugh wrote to Lord Manchester in December, was to "travel to Kensington, where the King's thoughts upon it are to be had." Of the early life of Vanbrugh we know little, for he is usually described only as "Dramatist and Man of Fashion." He had been a professional soldier, he was a wit, "consorting with that clever group of authors and aristocrats that formed the Kit-Kat Club." It was probably there that he met Manchester and Carlisle, when the latter, "struck by his views on architecture, engaged him to be architect for the palatial house in the Italian manner that he wanted erected in the wilds of Yorkshire."

Although we have no documentary evidence before the year 1700 that Hawksmoor was in any way in co-operation with Vanbrugh in respect of Castle Howard, it is improbable that he could have put the drawings into any definite and acceptable shape without the assistance of that "professional who thoroughly understood his job and yet was prepared to accept a subordinate position."

Of Vanbrugh's high opinion of him and of the important part he played in the design of Blenheim, there is abundant evidence. Boulter and Joynes were the joint controllers of the works, and letters to them from Vanbrugh contain such phrases as: "Mr. Hawksmoor is of my opinion," or "My opinion and Mr. Hawksmoor's is this." From a letter of Vanbrugh to Joynes, dated 1706, it would seem that Hawksmoor had quite a lot to do with the designing and drawing of the details of Castle Howard. It runs: "If you have with you my Lord Carlisle's Papers, You'll oblige me to draw the Two Fronts, pretty exact, they being for the Engravers to work from: As for the Ornaments on the Top, with the Chimneys on the Main Pile, and the Cupola, I'll get Mr. Hawksmoor to Add them here, for I believe you have not the last Designs of 'em." If we are to believe that he was independently engaged on the Queen's College Library, begun in 1692, it is difficult to imagine him at the age of 34, and after 15 years' service, still limited to "copying" for Wren. Most of his independent work was indeed at Oxford, at Queen's, if not the 1692 Library, there is at least no doubt as to the authorship of the New Hall, of which Provost Lancaster laid the first stone

in 1710. In the same year was started the Quadrangle (front) and the new building for the Clarendon Press which is in turn attributed to Hawksmoor and Vanbrugh, though it was probably a joint affair. In London he is principally remembered for his three East End churches, St. Anne's, St. George's, and St. Christ Church, and for St. Alphege, Greenwich, St. Mary Woolnoth, and St. George's, Bloomsbury, the last erected when his mind was full of the Mausoleum of Halicarnassos.

Colin Campbell, by no means a lover of Hawksmoor, in his *Vitruvius Britannicus* definitely, though rather grudgingly, admits that Easton Neston "the ingenious Invention of Mr. Hawksmoor, to whom I am indebted for the Original Drawings of this house, any many other valuable Pieces for enriching the Work which I could not in Gratitude conceal from the Publick."

The relative position of Hawksmoor in the history of English architecture is now more likely to be under-

stood. "We may take somewhat different views," said Mr. Tipping, "as to his capacities and genius, but quite clearly he is a corner-stone in the architectural history of his age, so that his life is worth much closer study than it has hitherto received." He was always loyal to his first and great master, and deplored the entire setting aside of his rebuilding scheme after the Fire. When he saw the casual way in which the City was being set up again, it affected him deeply.

"We have noe City," he wrote, "nor Streets, nor Houses, but a Chaos of Dirty Rotten Sheds allways Tumbling or takeing fire, with winding Crooked passages (scarce practicable), Lakes of Mud and Rills of Stinking Mire Running through them. . . . this Sort of Vermin has run and spread all over ye Country."

"... Poor Hawksmoor, what a Barbarous Age have his fine, ingenious Parts fallen into. What wou'd Mons. Colbert in France have given for Such a Man?" Such is Vanbrugh's testimony of his worth.

The Office of Works have scheduled the following bridges in the County of Durham as ancient monuments: Framwellgate Bridge (Durham), Elvet Bridge (Durham), Chester New Bridge (Lambton), and Sunderland Bridge.

Leasehold Reform

Some amendment of the law relating to leasehold property is set down in the programme of Government legislation for the present session. It is believed that the changes in contemplation are intended to meet the grievance of a leaseholder who, having built up a good business during his tenancy, is faced, on the expiration of his term, by a demand from the ground landlord for a heavy premium for a renewal of the lease or the grant of a fresh one. In extreme cases, the lessee may find that the premises have already been sold over his head to some rival in the same line of business, who, thereupon, come in to take the connection he has built up and reap the fruits of his labours. It is apparent that any proposal to vary the terms of existing contracts will meet with determined opposition from Lord Banbury when such a measure reaches the House of Lords, although his Lordship does not object to a modification of the law in the case of future leases. It is to be hoped, however, that amendments of the present law will not take the form of compelling the owner of a property to sell the freehold if the lessee so wills. One can easily imagine cases where, following such a compulsory sale, the former lessee might erect a new building that would be a discordant note in the neighbourhood and spoil the amenities of the surrounding property.

BLACKPOOL HOSPITAL COMPETITION: FIRST PREMIATED DESIGN.
MESSRS. GIBSON & GORDON, Architects.

VICTORIA HOSPITAL COMPETITION, BLACKPOOL

Mr. H. Percy Adams, F.R.I.B.A., who has acted as assessor for the Victoria Hospital Competition, Blackpool, has given his award. The winning design is that of Messrs. Gibson & Gordon, while schemes presented by Messrs. Saxon Snell & Phillips and Messrs. Adshead, Topham & Adshead have been placed second and third respectively.

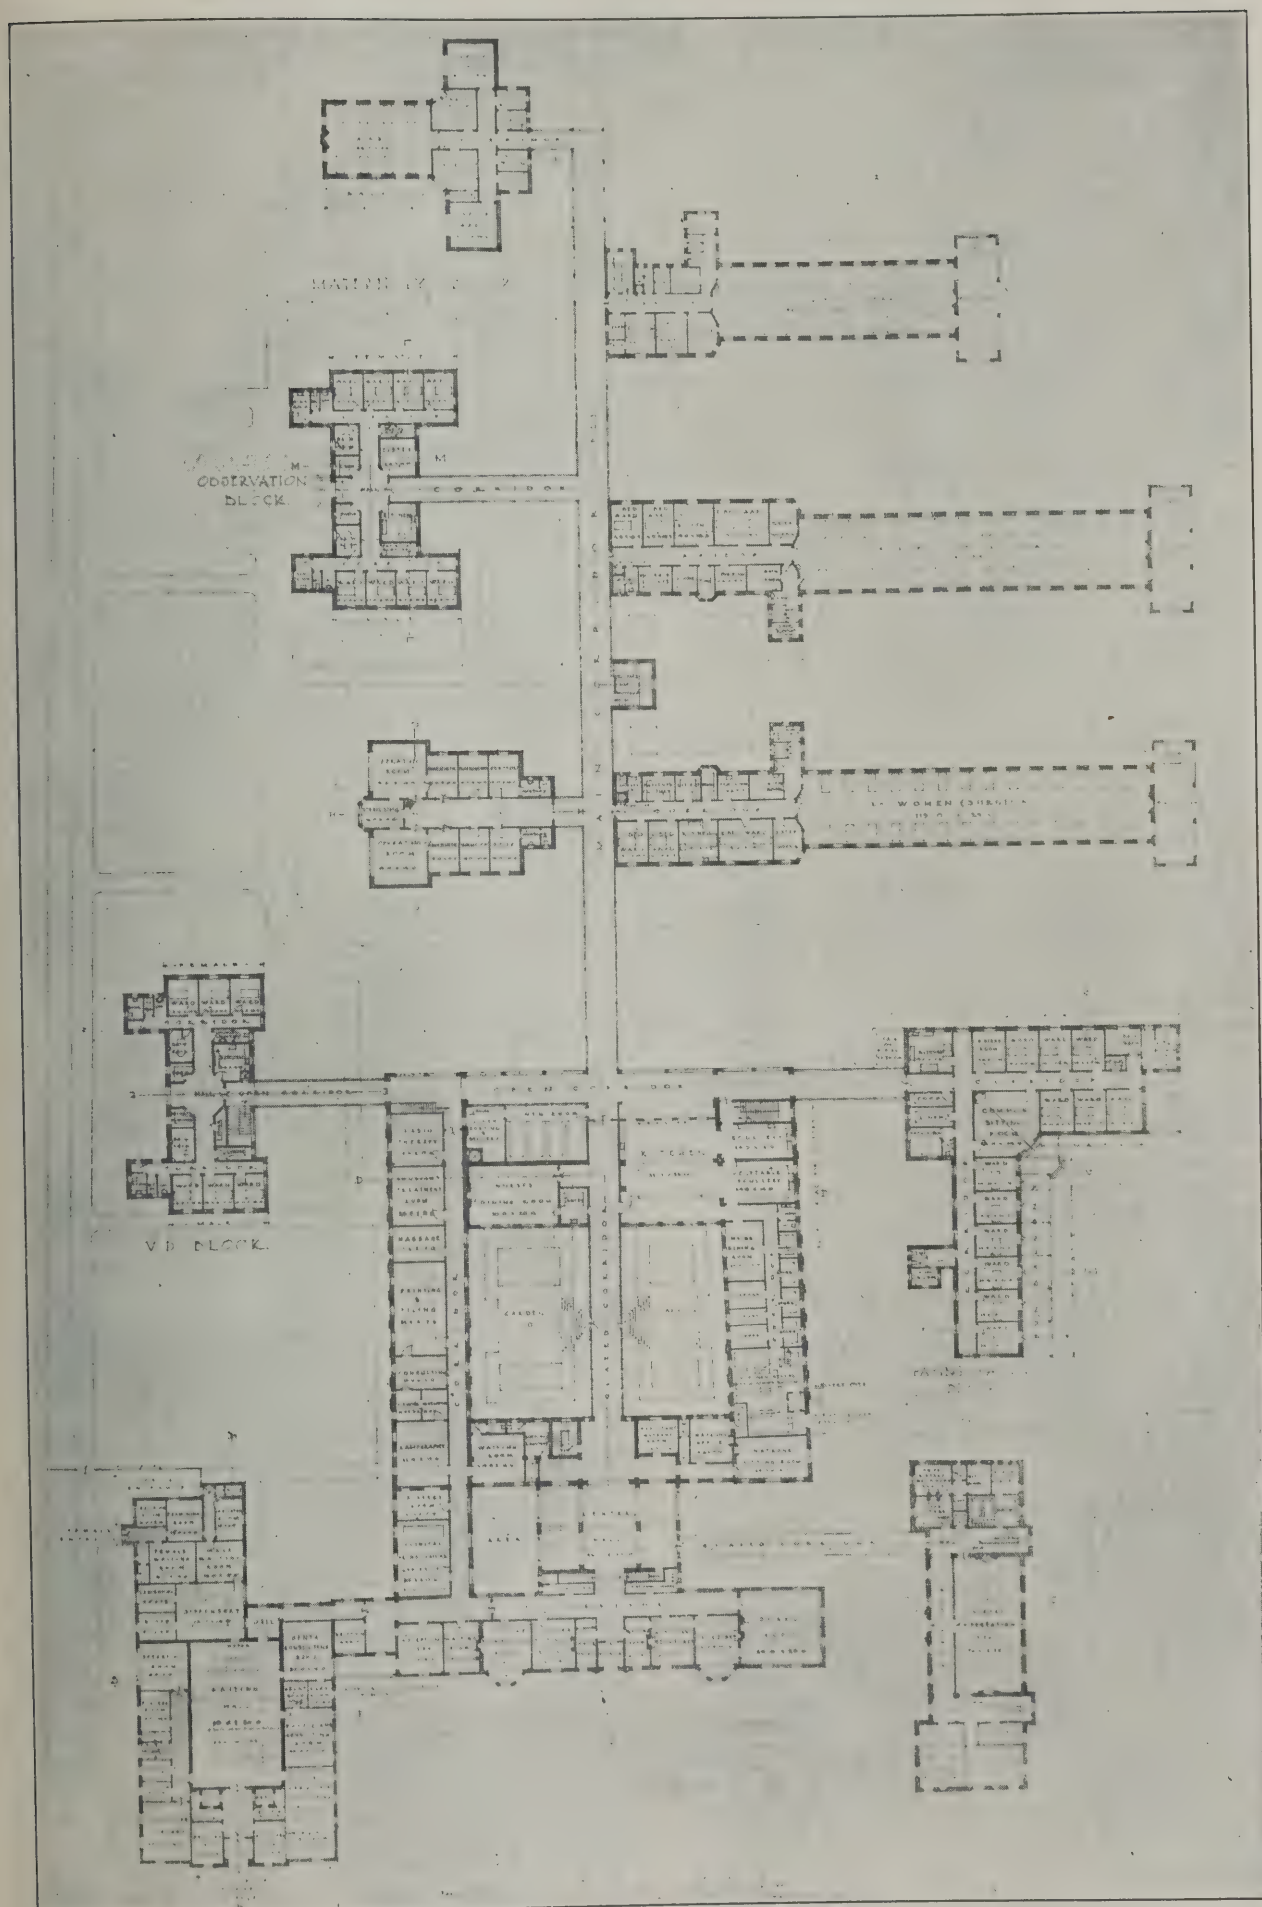

The designs submitted for the remodelling and extension of this hospital confirm one's opinion that architects with a highly developed artistic conscience are likely to gain little satisfaction from their attempts to comply with the utilitarian conditions which are laid down for this type of structure. Mortuaries, operating theatres, nurses' homes, special septic wards, boiler houses are required to be scattered on various portions of the site, and he would indeed be a super-human genius in design who could succeed in giving to the lay-out of these buildings that order and coherence which is the hallmark of great architecture. Under the circumstances, the architects who have submitted the three schemes premiated in this competition have done exceedingly well, for in each case they have provided a dignified entrance courtyard characterised by a symmetrical composition, and if in what one may describe as the hinterland of the group a more chaotic disposition of the buildings obtains, one can only suppose that this was unavoidable and be grateful to such measure of formality as has been vouchsafed to us in the neighbourhood of the main entrance.

The ward accommodation was to be for approximately 200 patients, including surgical cases of both sexes, children's wards, maternity wards, septic and observation wards, whilst paying patients have to be

provided for in a separate department. The competitors were also required to provide an out-patients department, self-contained, and consisting of a large waiting hall, with registry office adjoining, consulting rooms, surgery, dispensary, laboratory and store.

Accommodation was also to be found for fifty nurses who were to have besides bedrooms, a common dining room, recreation room, tea, kitchen, and other domestic offices. The administration department was to comprise a good central hall, medical staff, consulting room and library, board room and secretary's offices while the matron, assistant matron and medical officers were all to have their private quarters. A very important branch of the hospital is the clinical pathological laboratory, which is required to have a North light. In this block two operating theatres were called for, two anæsthetic rooms and a sterilising room. It is necessary to mention in detail the variety of the accommodation demanded in order that the nature of the architect's task should be understood.

Comparing the three schemes, it is apparent that the communication between the various blocks in the winning design is superior to that in the others, while the disposition of the buildings is such that the labours of administration and supervision are reduced to the minimum. It must be observed, however, that in this instance the three premiated designs are very near to each other in the degree of excellence attained and the assessor must have had considerable difficulty in assigning to them an order of merit. It is likely that considerations of building costs played an important part in his decision. The competitors were required to submit in great detail their estimates of costs.

VICTORIA HOSPITAL COMPETITION, BLACKPOOL: FIRST PREMIATED DESIGN
MESSRS. GIBSON & GORDON, Architects.

THE IDEAL HOME EXHIBITION

Olympia, March 1st to 26th

The experience of the past few years, and particularly that of the British Empire Exhibition, is gradually making exhibitors realise the value of an attractively designed stand. It is thus that the proportion of well-designed stands grows from year to year, and an almost distinct type of exhibition architecture has been evolved, which, unfortunately, has spread even into the field of general outside building, as opposed to temporary structures under one roof erected for the purposes of display.

A notable example of exhibition building is the exhibit of Hope's Metal Windows. Simple in shape, and decorated in orange with a black plinth, the effect is at once striking and severe, and it is entirely expressive of its function in so far that metal windows and doors are displayed in a thoroughly convincing yet agreeable manner. The lettering, too, is almost beyond reproach, and as this important point is so often neglected to the detriment of building, and of exhibition building in particular, stands which are conspicuous for the quality of the lettering upon them deserve notice if for no other reason. The Crittall Manufacturing Co. are exhibiting in a similar manner, and with Hope's, have given what are probably the two best examples of exhibition building in the exhibition.

The houses built in the housing section, with the possible exception of First Prize Design in Class "A" of the *Daily Mail* competition, designed by Mr. Gordon Allen, are without much architectural interest; but the Housing Section itself shows quite clearly the developments which have taken place during the last few years towards a recognition of the importance of fittings and equipment and structural and decorative details. Carter & Co., Ltd., of Poole, exhibit a "house of tiles," designed by Mr. Leslie Mansfield. The tiling was designed by Reginald Till, A.R.C.A., to illustrate in as interesting and convincing a manner as possible the many uses to which tiles can be put in modern buildings. The turret roofs are of black glazed Spanish tiles, and the interpretation in pot of cornice, frieze and plinth is very interesting. The design and execution of this stand is notable as an illustration of the peculiar and interesting character of the potter's material and its application.

The exhibit of W. H. Gaze & Sons, Ltd., in a stand decorated in cream, relieved by dull red, blue and gold, is a triumph in the "new decoration." It is quite free from the excessive modernity which so mars many of the stands, and yet the charming decorative work exhibited is essentially modern in character.

Of a similar type is the stand of Maurice Adams, Ltd., Designers and Craftsmen. This is exceptionally well designed, and exhibits some good colour and fabrics: the lettering on the fascia is excellent, and the whole exhibit is at once a delight and an inspiration. In this important field of decoration, Story's, of Kensington, show some interesting work: Thos. Parsons & Sons, in a carefully executed room suggestive of the period of William and Mary, show what a salutary effect the revival of interest in flat wall surfaces is having on interior decoration; while the Walpamur Co., Ltd., in a stand which is really a little too clever, displays some excellent colour, particularly in green, black and red.

The exhibit of the Rubber Growers' Association, Inc., has been designed to show as many as possible of the domestic applications of rubber. Architects are growing more and more in sympathy with the rubber floor, and besides exhibit-

ing this particular branch of the industry, there are examples of a form of rubber stair carpet, rubber panelling, and the latest productions in sponge rubber, mattresses, armchairs, and cushions.

The exhibited work of W. Aumonier & Son, Decorators, shows modern craftsmanship at its best, and architects should be particularly interested in this work, which, decidedly Swedish in character, is fully representative of the best ideals of architectural decoration. The two metal mirrors, decorated with conventional figures in low relief, are especially worthy of mention, and their silvered wood candlesticks are particularly in character with present-day ideas of decoration. Mr. E. Aumonier, of the above studios, was also responsible for the design of Catesby's stand, which, decorated in black and purple, is in design distinctly reminiscent of the Paris Exhibition, where, incidentally, in 1925, W. Aumonier & Son were awarded the silver medal for colour decoration.

The exhibit of the Plywood Development Association is most interesting and decorative: the door faced with gaboon mahogany shows how fine a thing a plywood door can be, and doors are also shown at this stand stained by permanent chemical stains (Stainax Co.) to pleasant shades of grey and brown. Froy, of Hammersmith, in a very modern stand, exhibit some equally modern sanitary fixtures and fittings, including two luxurious tiled bathrooms. Special features of this exhibit are the porcelain enamelled apron-type baths, made all in one piece, and an interesting example of wall treatment in green and mother-of-pearl tiles.

The London Gas Exhibit is housed in a quietly designed stand, and shows almost the whole range of application of gas to domestic use. It consists of a number of rooms, including a bathroom and a kitchen, with built-in gas fires and gas cookers, which effectually demonstrate the reduction of household drudgery in a very attractive manner. An analogous exhibit is that of the Standard Telephones and Cables, Ltd., in which is demonstrated almost every conceivable form of electrically-operated domestic appliance, including washing machines, ironing machines, domestic hand irons, vacuum sweepers, toasters, and coffee percolators. An actual apparatus and fittings in connection with drainage, sewage purification, and water purification, particularly for use in connection with country houses and public institutions which are outside a publicly sewered area, is exhibited by Tuke & Bell, Ltd. This is most interesting to architects, who normally are not able to see an actual installation under favourable conditions, and the method adopted for exhibition makes the process and construction particularly clear. It is impossible to make even a mention of every noteworthy exhibit, and in our next issue we hope to deal more particularly with some of the other many interesting exhibits.

The classical sculptures in the Ashmolean Museum at Oxford have been drastically overhauled under the direction of the Keeper, Dr. D. G. Hogarth, and Prof. Beazley. Their work has been mainly directed to removing "made-up" sculptures in the Randolph Gallery and to depriving many other pieces of heads, arms and other modern restorations, which appeal more strongly to the eye than the genuinely antique parts. Chronological sequence has been aimed at, and unsightly wooden pedestals have been replaced, as far as possible, by antique cippi and altars in the collection.

VICTORIA HOSPITAL COMPETITION, BLACKPOOL: LAY-OUTS OF WINNING DESIGNS

BUILDINGS BY THE BROTHERS PERRET

A Notable Contribution towards the Architecture of Concrete

By HOWARD ROBERTSON, F.R.I.B.A., S.A.D.G.

Only two or three years ago we were all startled by seeing the first photographs of an amazing new concrete church at Le Raincy, near Paris, a building which seemed to suggest all sorts of exciting possibilities in concrete design. Quite a number of English architects went over to Le Raincy to investigate for themselves, and came back with many and mixed impressions, and those who regularly attend the general meetings of the Architectural Association may remember the interesting description which was given one evening of Le Raincy by H. M. Fletcher, just back from Paris, and able to fill in the gaps which even the best of photographs are bound to leave in respect of the colour and atmosphere of buildings.

The architects of Le Raincy Church are A. and G. Perret, names already familiar and respected in England, where the work of distinguished foreign colleagues is being much more closely followed and reported than of yore. Auguste and Gustave Perret, in company with their brother Claude, are in the unusual position of being both architects of distinction and builders of high repute. A. and G. Perret are both fully trained Beaux-Arts men, with a record of academic successes behind them; they are able to hold their own in design with any of their contemporaries. At the same time, the firm of the three brothers is one of contracting executors, not only of their own work, but of that of other architects. Their fame as builders rests chiefly on their skill in

reinforced concrete, but they are not solely restricted to that material.

Needless to say, this dual activity as architects and builders places the Perrets outside the pale of the Code Guadet, the French guide to professional conduct, for the rules in France as regards ethics are very similar to our own.

Apart from the church at Le Raincy, the Perrets are best known in England by their Théâtre des Champs Elysées, which was completed a year or two before the war, and which provided at the time something in the nature of an architectural sensation. This theatre was many years ahead of its time, at least as far as France was concerned, and it is still the best theatre in Paris. It is one of the few examples of a logical treatment of concrete structure with an applied surface dressing of a richer material, the Roman system which has been so much abused, and which yet has so much to commend it.

The theatre at the Paris Exhibition of Decorative Arts of 1925 was also the work of the Perrets. Ingenious in plan and structure, and perhaps a little lugubrious in its internal effects, it had one feature which might have given it a peculiar interest from the stagecraft point of view. This was the triple stage, not by any means a new idea, but one which has never been developed in the modern theatre. This arrangement makes possible continuous action by the use of the lateral stages as relief scenes during the main stage setting, and permits of large "ensemble" effects. As might have been expected, the three stages were never used during the whole of the exhibition, and nothing was put on in this theatre which in any way benefited by the possibilities which the design of the Perrets had provided.

Apart from the two theatres, the Perrets have carried out a good deal of industrial and private work. The garage in the Rue de Ponthieu (Fig. 1) is a remarkable work even to-day, and yet it was built as long ago as 1905; the brothers have had large utilitarian contracts, such as concrete docks at Casablanca, and at the other end of the scale are quite small private houses such as that (recently described in *THE ARCHITECT*) for Chana Orloff, the sculptor. Another building of great interest is the observation tower at Grenoble (Fig. 2), which so well illustrates the principles along which the Perrets work in both the design and construction of reinforced concrete structures.

The tower is a permanent monument, although it was built during a recent exhibition at Grenoble, and was one of its chief architectural attractions. Grenoble is one of the principal centres for mountain climbing in France, and this tower gives a magnificent panorama of the highest summits of the *Alpes Dauphinoises*. The construction presented very real difficulties, for the soil for a depth of some 35 feet is made up of wet clay. The foundations consist of 72 concrete piles, reinforced at the upper ends for a depth of 16 feet, and on which rests a concrete drum forming a base for the eight piers constituting the principal structural members of the tower, which rises to a total height of about 275 feet.

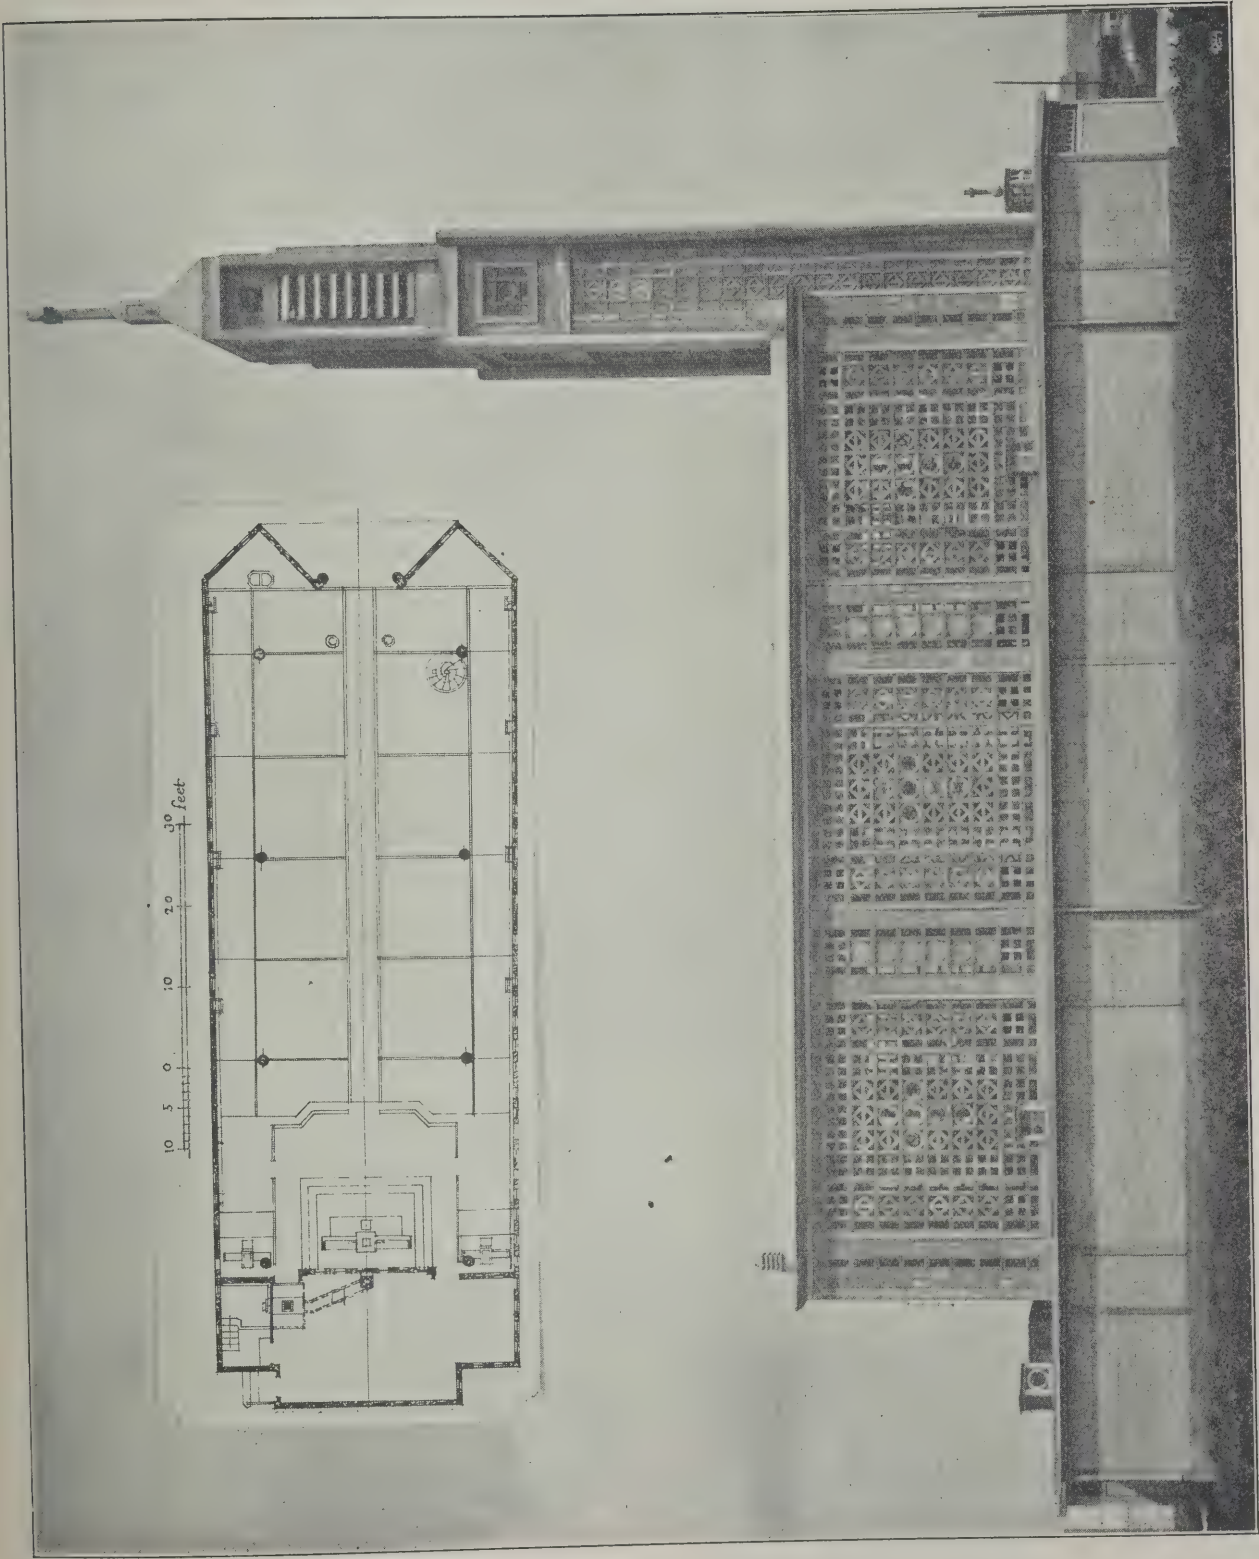

The predominant structural effect is of strength and lightness, and there is no suggestion whatever of that masonry-like quality which in the opinion of Monsieur Auguste Perret is one of the main weaknesses in modern design in reinforced concrete. Structures such as the Einstein Tower of Erich

Mendelsohn's would come under this heading of criticism, the argument being that the nature of the material permits of the lightest type of framework and infilling, and that the use of heavy masses of concrete (except for special purposes) is unnecessary and uneconomical.

It is because the Perrets not only design but build that their views on the proper employment and expression of concrete carry such special weight. It is not a question of theorising on purely abstract grounds, but of economic and engineering facts, and the remarkable design interest which is attached to their buildings shows that there is a close link between logic of structure and beauty of form. It is not hyperbole to say that the Perrets have made the biggest contribution towards the fusion of abstract design and the science of structure of any architects of the 20th century. It is only surprising that so

few of those who have the ability to specialise in reinforced concrete work have paid any real attention to the remarkable possibilities which the work of the Perrets is revealing.

It must not be forgotten that this work is continually subject to the pressure of economic restrictions. It is a feat to build a church such as that at Le Raincy in "straight concrete" and produce effects of such architectonic quality; it is a still greater achievement to build it very cheaply.

The problem of low cost has been the dominating factor in another very interesting church of the Perrets, completed in 1925, that of "Sainte Thérèse de l'Enfant-Jésus, at Montmagny, about 15 miles from Paris (Fig. 3).

It will be at once noticed, by those who remember the Le Raincy church, that the design of Ste. Thérèse is very similar; the explanation is that the same moulds and forms which were employed for Le Raincy were used here, a proceeding which enabled this by no means small building (approximately 40 ft. wide by 115 ft. long by 35 ft. high, with a tower of 104 ft.) to be erected for the sum of 325,000 francs (at the then rate of exchange, about £4,000). This sum includes for the altars, fittings, the font, and the organ gallery. The plan is clean and simple, the method of framing on piers, with the walls as light infillings, being clearly visible.

There is a central nave and side aisles, above which the nave is lit. The reason for this arrangement is that the aisle walls are party walls, and if adjoining premises are ultimately erected, the church will have to depend for its lighting on the set-back which the plan provides. The construction throughout is of the simplest, being entirely in reinforced concrete, the roofs of the aisles and the nave being in two thicknesses to obviate condensation.

As at Le Raincy, the main effect of the interior is produced by the geometrical patterns of the window tracery, which—until stained glass can be provided—is fitted with tinted glass of hues varying from blue to yellow. There are also some fresco paintings on the east wall above the altar which have a very great decorative value. Painting and glass are both forms of decoration which are capable of great development in connection with building in concrete, and certainly colour has only to be seen in both these concrete churches to be appreciated at its full value.

Probably concrete will never realise its full æsthetic possibilities without the aid of some relief either in material or colour which will bring out the value of its plain surfaces of neutral tone; but it has in itself possibilities of texture, of modelling, and of decoration in "repeat" patterns of which designers are only just beginning to have something more than an inkling. It is only a question of a short time before the work of the Perrets will receive the general attention which its significance merits, and other designers may be encouraged to experiment more boldly in the same medium. In this connection it is a source of satisfaction to remember that England has not been without at least one pioneer along similar lines, in the person of the late Leonard Stokes, whose extraordinarily interesting concrete cathedral at Demerara was mentioned and partially illustrated—further photographs not being available—by Mr. George Drysdale in his recent lecture at the R.I.B.A. No doubt Mr. Stokes would have been enormously interested by this latest proof of the Perrets that modern French architecture is showing renewed vitality.

The death has occurred of Mr. George Sutherland (66), F.R.I.B.A., senior partner of the firm of Messrs. Sutherland & George, architects, 26 Crown Street, Aberdeen. Mr. Sutherland was a native of Banff.

Causes of Fire

The country house fire topic crops up now and again, with the general conclusion that putting modern grates, central heating or electric light into old houses is the most fruitful cause of the trouble. That there are other causes is proved by recent letters in *The Times*, where correspondents have given instances of the malign effects resulting from mirrors, water bottles and shaving glasses being so fortuitously placed as to catch the direct rays of the sun. Considering how popular a plaything the burning glass is to youth, it is perhaps surprising that its possibilities seem to be overlooked by maturer minds.

Possibly so many of us are town dwellers, under a more or less perpetual pall of smoke, that when we move into the open country we are apt to ignore or discount the power of the sun in the spring and autumn when it is in the most favourable position for sending its rays through our windows.

Mr. Oliver Hall, A.R.A., was elected a Royal Academician last week. Mr. Hall is a landscape painter with a strong sense of form, and has a bent for architectural subjects. He has achieved great distinction in water-colours and black and white work.

THE STUDY, "THE ORCHARD," CHORLEY WOOD.

C. F. A. VOYSEY, Architect.

C. F. ANNESLEY VOYSEY

The Man and His Work—V

In speaking last week of the house at Combe Down it should have been mentioned that it was the owner's desire that the building should reflect the character of Merton College, Oxford. The house is built upon a mound in the centre of a stone quarry.

It has already been said that when, in 1884, Voysey set up in practice on his own account, he had no commissions, and had not, at that time, tried his hand at the fabric and wallpaper designing, which was to keep him afloat during those first five years. The circumstance which led him to turn his attention to this work was accidental. If he had not happened to visit his friend A. H. MacMurdo at a certain hour on a certain day he would not have then given his attention to this field of design, and, as other activities of some sort would have engaged him, it is conceivable that he would in that case never have designed fabrics or wallpapers and probable that he would never have become widely known as a designer. A. H. MacMurdo was a man of gifts and a pioneer in the rescue of furniture design from the slough of stale, unfeeling conventions in which industrialism had engulfed it. He was perhaps the first to adventure on the new ground which Morris and Voysey were to possess. At the Inventions Exhibition in 1883 he showed examples of furniture of a simple, practical design, then quite a new thing, his intention being to illustrate how such furniture could be made without dispossessing the almighty dolt machine. MacMurdo was an intimate friend of Ruskin and, among other works, was architect of Hamo Thornycroft's—the sculptor—house at Hampstead. At the moment Voysey called on him he was employing himself in fabric or wallpaper design, and it was this that put it into Voysey's head to adventure in the same field. His first work, a design for a frieze, was bought by Jeffreys, who after-

wards undertook the whole of the printing of Morris papers, and Voysey at once found buyers of his designs. In particular the Essex Company may be said to have adopted him. For a long time Voysey was under contract with the firm to supply it with twenty designs a year. Voysey in fact established the Essex Company; the character of their wallpapers was identified with Voysey's individuality, and when the public spoke of "Essex wallpapers" they meant Voysey designs. Mr. Essex was discerning, and he was courageous in talking his opinion as he did; and the enormous vogue which Voysey wallpapers soon obtained was due to him. Voysey made the Essex Company, and in a less exact sense the Essex Company established Voysey design.

It must be remembered that the influence of Morris was at that time only beginning to be felt; in 1880 his work was unknown except to satellites. Voysey first noticed Morris designs one day when he passed the Oxford Street shop. He appears to have at once recognised their power, for he paid them the signal tribute of studiously avoiding the shop and not noticing Morris designs when he otherwise encountered them. I divine that he was afraid of them; he felt that to become familiar with them would lead him astray from the full development of his own sense of design. Most men would have noted Morris' method and tried to benefit by what they learned in doing so, but Voysey took the Voyseyesque line and did the opposite. Those days, however, are long past; Voysey is a great admirer of Morris patterns, although he does not at all admire a great deal of Morris' interior decorative work—Stanmore Hall, for instance.

There are marked differences between Voysey and Morris designs. It is difficult to imagine that from

BILLIARD ROOM, "THE HOMESTEAD," FRINTON-ON-SEA

C. F. A. VOYSEY, Architect

the huge output of the two men any one pattern could be chosen which would for a moment confuse anyone on the question of authorship. The individuality of the artist might alone mark the distinction, but there are, I observe, radical differences. Voysey characteristically conceives a design as a pattern and seeks to emphasise the pattern; with Morris the pattern is never emphasised, but appears rather as a restriction imposed by the need for repetition: in some of his wallpapers—the "Willow," for instance—the fact of repetition is so veiled that it is only by close scrutiny, supported with the knowledge that a pattern must be there, that it can be discovered; and even after discovery and close acquaintance this design still does not resolve itself into a pattern; its appeal is not the appeal of a pattern. Even in his simplest designs, which consist of the repetition of two or three separate emblems—as in the well-known "Daisy"—the design does not recommend itself, or even markedly present itself, to the beholder as a pattern. With Voysey, on the other hand, we feel that the pattern is the chief thing: in fact, apart from the individuality which marks every spray, bird, insect, or flower which he has drawn, it seems to me that the thing which Voysey has particularly contributed to the art of wallpaper and fabric design, and made the common property of designers, is the effects to be obtained by arrangements in pattern. I observe, too, that while Morris made no use of abstract forms—shapes not directly associated with any object in nature—Voysey has some fondness for them. It is odd, therefore, that Voysey's designs should, with this exception, be much closer to nature than those of Morris. No one who has seen the early Rheims tapestries, some of which were lent to South Kensington Museum six or seven years ago, could have any doubt of the origin of Morris' inspiration in wallpaper design. McKail, in his *Life*, says nothing of this, although he speaks of Morris' travels as a young man in the North of France. It can, however, be said that if he had not seen these tapestries, and Botticelli's pictures, and

such things as the wardrobe in the Pope's Palace at Avignon, Morris, as he is known to us, would not have been. Morris seems to avoid any close representation of natural forms; Voysey, on the other hand, observes closely the plant or creature he embodies in his design: we can recognise and name all of them. His birds, of which he makes use in large numbers and of many kinds, are remarkable for the identity of species. We can recognise them at once; and the few board touches and washes by which they are represented usually show us some characteristic of the bird which we had not previously observed. Voysey's version of a particular kind of bird is more like the bird it depicts than the actual bird itself is. Morris either avoided, or spared himself the trouble, of such close observation; he is content to stop at the genus, and, although he often fills in more detail than Voysey does, indicating sometimes the feathers, he leaves us guessing, should we so amuse ourselves, at the species, while Voysey, without any pictorial elaboration of the hoard rendering of the design, interprets the species to us with a skill which no draughtsman could attain who was not a devoted observer and lover of birds. The above comparison is not intended to set Voysey above Morris as a designer, but only to draw attention to the strong differences in motive and in execution which distinguish the work of the two men.

In one particular Morris had a great advantage over Voysey: he controlled the whole process of manufacture until the paper left the printing machine and the fabric the loom. He overlooked the cutting of the blocks, the mixing of the colours, the choice of the paper, tested and experimented in all directions so that he was responsible for the finished production down to the smallest detail, and was able to secure that only the best methods and materials were employed. Voysey had no such opportunities. His work ended with the making of the design, and he was then at the mercy of those who bought the design. He had no control over the use made of his design, which, if a wallpaper, was not necessarily printed in

the tints he had fixed, but in approximations to them only, or even with tasteless transpositions or substitutions of the colours he intended, and by machinery and on any kind of paper which the manufacturer chose to use. Parallel conditions handicapped him in getting justice done to his fabric designs. It is a mark of the force of his ideas that in spite of such handicaps Voysey's achievement should stand where it does.

The design of furniture, which Voysey first embarked upon in completion of his house designs, has also had a deep influence upon modern furniture; and here again not so much in the permanency of the designs themselves, as in his approach to the subject of furniture design—in the spirit which first clearly perceives the exact need and then sets about to interpret that need freshly, efficiently and economically. The simple form and the fine lines of the furniture shown in some of the photographs illustrating these articles will be recognised as begetting much that has since become the common property of furniture designers. The billiard table illustrated in these pages is typical of the vigour of Voysey's liberating influence. This design was made when all the legs of all billiard tables displayed heavy bulbous tuberosities which bore no relation to the fine lines and rigid form which the purposes of the table gave to its frame and bed. The design was made for Messrs. Thurston's many years ago, since when the firm has sold more of it than of any other design, and it still remains the best liked by billiard players who wish to furnish their own room.

If it had been possible to illustrate the whole field of Voysey's work in these pages they would have shown architectural designs representing many different classes of buildings, wallpapers, fabrics of all kinds, carpets, furniture, silver and brass work, church ornaments; designs in mosaic, enamel, marble inlay, and stained glass; book plates, medals, and wood and stone sculptured from his models. His versatility is remarkable, as is his enormous output, which was dependent not only upon his industry, but upon the speed with which ideas present themselves and are reduced to practical terms on the drawing board. In his most active years Voysey's staff seems to have consisted of no more than two or three pupils, and in an atmosphere of a happy family the letters were written by someone and press copied by somebody else. No telephone ever disturbed the tranquility of Voysey's work, which during a large part of his career was done at his home, which at one time was at Bedford Park and at another at Streatham.

It has only been possible in these articles to give a hurried survey of what seems most important in Voysey's work and to attempt to identify the matters in which the younger generation of architects—all too unknowing—are indebted to his discernment and fearless single-mindedness of purpose. The times have changed: the forms that once pleased because they were new now cease to do so because they no longer are. From year to year—nay, from month to month and day to day—the need for each idea to be a variant of what is familiar, is marked by ever-changing fashion of taste; but there is a fundamental truth that is everlasting, for it is one with the spirit of man and underlies the meaning of all Art. That is the spirit of worship. Does not the canoe-paddle devotedly carved with a splinter of shell by a poor savage, throw into contempt the whole vain lumber burdening the groaning floor of a city's emporium? When Time has given the perspective in which alone mankind can determine the value of its own achievements, I deem that the thing Voysey stands for, and those of his works which best represent his aspirations, will be raised high in the affections of all men.

Building News in Parliament

WESTMINSTER, Wednesday, March 2.

Parliament has shown special concern during the past week for the preservation of London squares, and this solicitude is not confined to one party. A Labour Member, Mr. Scurr, introduced a Bill, to which the House of Commons was unanimous in giving a first reading, for the purpose of preventing squares and enclosures in the Metropolis being built over. The Bill is moderately framed, although it emanates from a Socialist source. It proposes to empower the London County Council or the local Borough Council, in the event of either body coming to the conclusion that a particular square or enclosure should be acquired by the public to prevent it being built over, to demand that an inquiry should be held by the Ministry of Health. If, as a result of such inquiry, it is agreed that the open space ought to become public property, then the owner or owners will receive compensation under the terms of the Town Planning Act.

There was a touch of exaggeration (to which some Parliamentarians are prone) in Mr. Scurr's description of the London squares as "oases in a Sahara of brick," but, on the whole, he made out a good case for his Bill. He quoted two recent cases of the disappearance of squares. One was the building over of Endsleigh Gardens by the Society of Friends, the other the acquisition of Mornington Crescent by a firm of cigarette manufacturers.

Although the Covent Garden Bill has been withdrawn, it has not been forgotten. Mr. Chamberlain, the Minister of Health, was questioned as to whether steps are to be taken to safeguard the Foundling Hospital estate from possible encroachments from other quarters. The Minister's reply was that he is in communication with the London County Council, who have the question of London squares under consideration, and that he will continue to give the matter his attention. He added that the squares on the Foundling Hospital estate are within the area of a town-planning scheme which the L.C.C. are now preparing.

Among the multifarious questions which demand the attention of the Minister of Health, it is clear that the advancement of town-planning throughout the country occupies a foremost place in Mr. Chamberlain's mind. Already, he was able to announce, 294 urban authorities have prepared or are preparing town-planning schemes, a number of which extend to portions of other urban areas. There still remain, however, urban authorities, with populations of 10,000 or over, in which no formal steps have yet been taken for the preparation of town-planning schemes. The Ministry of Health, he added, are continually putting pressure upon these authorities to stimulate them to produce such plans.

Some idea can now be given, by means of statements which were made in the Commons within the last few days by the Minister of Health, of the number of brick houses which have been erected in England and Wales, and the number erected by other methods. Up to February 1, 519,444 have been erected with State assistance under the various Housing Acts by the ordinary building methods. Statistics are not quite so definite in regard to those erected in concrete and by other special methods, but estimates supplied by local authorities show that the number of these, for which contracts have been made is approximately 47,000.

Milton's cottage at Chalfont St. Giles is now undergoing structural alterations with a view to the incorporation of the adjacent buildings. Very fine oak beams have been disclosed by the work of restoration.

THE BRITISH INDUSTRIES FAIR

Birmingham Section

The Birmingham Section of the British Industries Fair, now being held at Castle Bromwich, draws to its close this week, by which time it is hoped it will have served its purpose once again in the cause of our inland and overseas trade. This year there has been an excellent display of exhibits of interest to the building trades, foremost among these being an exten-

sive range of mantelpieces, tiled hearths and surrounds, grates and interiors, to which most of the leading firms have ably contributed. Builders' hardware and ironmongery, including the domestic boilers and various heating and cooking equipment, forms another attractive feature of the present exhibition, as will be gathered from the brief resumé given below.

Tiles of many varieties and finishes for a wide range of purposes are being shown by MESSRS. MINTON, HOLLINS & Co., of Patent Tile Works, Stoke-on-Trent (Stand No. 48, Building A). The mantels on view at this stand are by MESSRS. THE REGENT WOODCRAFT Co., of Great Lister Street, Birmingham.

MESSRS. MARTINEAU & SMITH, of 56-62, Holloway Head, Birmingham (Stand No. 50, Building A), are exhibiting a variety of water and sanitary fittings, including cocks of the "easy-clean" and ordinary types.

At Stand No. 12 (Building A) MESSRS. THE CAMELON IRON CO., LTD., of Falkirk, Scotland, are showing the "Signet" Combination Grate with boiling hob beneath the oven, and a second model with hot closet above the oven. One of these grates is fitted with an oven which provides for the alternative use of gas or coal as the heating medium. The "Shield" Open Fire Portable Stove, with a compartment oven is also exhibited at this stand.

"Interoven" Stoves and the "Super-Interoven" are to be seen at Stand No. 67 (Building A), where MESSRS. THE INTEROVEN STOVE CO., LTD., of 156 Charing Cross Road, London, W.C.2, are giving cooking demonstrations to prove the general efficiency of these units, in which a large oven is provided, together with a roomy hotplate for boiling purposes, and a high-pressure boiler for hot water.

"Eagle" Patent Combination Grates in various sizes are exhibited by MESSRS. PARKER, WINDER & ACHURCH, LTD., Broad Street, Birmingham, at Stands No. 71-76 (Building A). The flues of this grate are self-contained, and one flue only suffices to work both the oven, boiler and hotplate.

MESSRS. THE RAWPLUG CO., LTD., of Rawplug House, Cromwell Road, London, S.W.7 (Stand No. 81, Building A), are showing a variety of labour-saving devices, such as the Rawplug and Rawplug bolt anchors; bathroom fittings in the new super aluminium, "Durium"; "Durofix" waterproof adhesive, "Duro-lustre" cellulose lacquer, and "Liquid Porcelain," a hard non-chippable cellulose enamel which can be applied to metals, wood, etc.

At Stands Nos. 100 and 101 (Building A), MESSRS. THE WELL FIRE AND FOUNDRY CO., LTD., of 15 Berners Street, London, have an attractive exhibit of "Well" Fires in new designs, shown for the first time. Many of these are reproduced in Fusion stone-ware, a dense and highly vitrified

material which has many advantages over ordinary tiles and faience.

MESSRS. A. BELL & Co., LTD., and THE BELL RANGE AND FOUNDRY CO. of Kingswell Works, Northampton (Stands No. 115 and 116, Building A) have tile fireplaces in an attractive range of colours, fitted with "Bell" fires. This exhibit also includes a new "Bell" faience gas fire with no visible metal work whatever.

Hygienic principles in construction and the perfected sanitation afforded by the use of tiles in covering walls and floors is the chief feature at Stand No. 123 (Building A), occupied by MESSRS. MAW & Co., LTD., of Jackfield, Shropshire. They are also showing fireplace surrounds in many varied forms and colours.

A new treatment for shop fronts, executed in Firth's "Staybrite" Steel, enriched with enamel work, is being shown by MESSRS. THE BIRMINGHAM GUILD, LTD., of Grosvenor Street West, Birmingham, at Stand No. 127 (Building A). This treatment offers advantages over other metals such as brass and bronze, in that the "Staybrite" Steel resists rust and corrosion.

MESSRS. THE CARRON COMPANY, of Carron, Stirlingshire (Stand No. 128, Building A), have a display of rustless firegrates. These grates have all the appearance of silver with the utility of steel, and invest the fireplace with charm and brightness. They have the further advantage of requiring the minimum of maintenance and cleaning, and being unaffected by climatic conditions are specially suitable for seaside residences.

Locks, latches and builders' hardware is being exhibited by Messrs. Josiah Parkes & Sons, Ltd., of Union Works, Willenhall, at Stand No. 130 (Building A).

Tip barrows for road contractors, of original design mounted on anti-friction bearings, and "Easy-Access" Bins for various trades, built on the unit system, are shown at Stand No. 143 (Building A) by Messrs. Frederick Braby & Co., Ltd., of Ashton Gate Works, Bristol.

The modern hygienic sanitary fittings, exhibited by Messrs. Elsan Manufacturing Company, of 34-35 High Holborn, London, W.C.1, at Stand No. 148 (Building A), include the "Elsan" Chemical Closet, for replacing the septic system and cesspool.

At Stand No. 154 (Building A) Messrs. Carter & Co., Ltd., of Encaustic Tile Works, Poole, have a range of Carter fireplaces of distinctive design, some shown with the fire on the hearth and some with raised metal grates; exhibits at this Stand

include briquette fireplaces for building in position, faience fireplaces in large blocks, slabbed tile and faience kerbs, as well as some interesting suggestions for wall tiling.

A working exhibit of the "Triplex" and "Workwell" Grates, manufactured by Messrs. Triplex Foundry, Ltd., of Grate Bridge, Staffs., is the centre of interest at Stand No. 159 (Building A).

Messrs. The Falkirk Iron Co., Ltd., of Falkirk, Scotland, and Henry E. Hoole & Co., of Green Lane Works, Sheffield, jointly occupy Stand No. 162 (Building A) with a display of fireplaces, interiors and dog grates, produced in rustless steel, copper, bronze and brass. They are also showing the "Smoothtop" series of Gas Cookers and the "Falco" Hot Water Boilers.

Porcelain enamelled baths, including the latest Sanitary Curtain Bath, combined baths and lavatories, lavatory fittings, and new designs in "Verosa" Majolica Enamelled Fireplaces, are exhibited at Stands No. 184 and 185 (Building A) by Messrs. M. Cockburn & Co., Ltd., of Gowanbank Iron Works, Falkirk.

Messrs. Scaffolding (Gt. Britain), Ltd., of 43 Lansdowne Road, Stockwell, S.W.8, the manufacturers and patentees of tubular scaffolding, "Scaffixer" scaffold ties, and "Conforms" stamped steel shuttering, are giving demonstrations daily at Stand No. 197 (Building A) to show the advantages of the up-to-date use of patent scaffoldings, etc. Photographs of contracts executed are also on view.

The "Janus" Back to Back Grate, with one fire-giving oven and hotplate in the scullery, domestic hot water supply and an open fire in the living room, is exhibited by Messrs. McDowall, Steven & Co., Ltd., of Lauriston Iron Works, Falkirk (Stand No. 199, Building A). New designs in Mantel Registers, Gas Mantels, and portable boilers are also displayed.

At Stand No. 199 (Building A) Messrs. The Coalbrookdale Co., Ltd., of Coalbrookdale, Shropshire, are showing the "Servall" Combination Grate and the "Warmall" Grate, as well as a range of patented adaptable fires.

A comprehensive display of grates, from the small Barless Grate to the latest "Foresight" Combination Ranges, is being shown by Messrs. Samuel Smith & Sons, Ltd., of Beehive Foundry, Smethwick, at Stand No. 201 (Building A).

The "Minerva" Heater and Warm Air Circulator is exhibited by Messrs. William Grice & Sons, Ltd., of Fazeley Street, Birmingham (Stand No. 22,

(Continued on page 422)

BUILDING CRAFTSMANSHIP—OLD AND NEW—IX

By Nathaniel Lloyd, F.S.A.

PANEL MOULDS AND DETAIL OF SASH WINDOWS IN WALNUT VENEER.

CENTRE PANEL OF SANCTUARY RAILING CARVED ON OAK.

THE CARPENTER AND ALLIED CRAFTS

By Nathaniel Lloyd, F.S.A.

The cupboards on each side of the sanctuary of Trinity College Chapel, Oxford, are veneered with quartered walnut. The chapel was opened in 1694, but Mr. Symer Vallance believes that although Wren was consulted two years earlier, the design is by Dean Aldrich. It is probable that the detail of woodwork, as that illustrated, was left to the very competent workmen employed, and the workmanship is of the highest order and worthy of study. The large panel of the reredos is inlaid with marquetry of walnut and surrounded by carving in limewood in the manner of Grinling Gibbons, the quality of which is such as may well have come from his own hands. The carving of the capitals, frieze and vases is on oak, as also on the pierced panels of the sanctuary railing, the framing of which is walnut veneer.

London Building Notes

ALBERT EMBANKMENT.—The Governors of St. Thomas's Hospital are to erect a new block of laboratories, at a cost of £30,000. The new building will be erected in red brick with Portland stone dressings, to the designs of Mr. H. W. Currey, F.S.I., 37 Norfolk Street, Strand, W.C.2.

BAKER STREET.—The Metropolitan Railway Company has decided to build a block of premises, consisting of shops and flats with a restaurant, on a site adjoining Baker Street Station. The surveyor to the company is Mr. E. S. Iles, L.R.I.B.A., Baker Street Station, W.1.

BASINGHALL STREET.—A site at the corner of Basinghall Street and Gresham Street, E.C.2, is being cleared with a view to the erection of a block of business premises, including bank, offices and shops. Plans have been approved by the City Corporation, the architects being Messrs. Robert Angell & Curtis, 133 Regent Street, W.1. The present operations are being carried out by Messrs. H. Sabey & Co., South Wharf, Paddington Basin, W.2.

BETHNAL GREEN.—A new nurses' home, nursing home, etc., are to be erected as part of a large extension to the Mildmay Mission Hospital in Austin Street, E.2. Mr. T. P. Figgis, F.R.I.B.A., 9 Old Square, Lincoln's Inn, W.C., architect to the Hospital Committee, whilst the first part of the building work is being completed by Messrs. Dove Bros., Ltd., Cloudesley Place, Islington, N.1.

BROADWAY.—Alterations are being carried out to premises in Broadway, Westminster, S.W.1, for the London Missionary Society. The builders are Messrs. Dove Bros., Ltd., Cloudesley Place, Islington, N.1. Messrs. Smee & Houchin, F.R.I.B.A., architects, 82-85 Fleet Street, E.C.2.

BURLINGTON GARDENS.—No. 5 Burlington Gardens, W.1, and the Hotel Bristol, in Cork Street, W.1, are to be converted into a block of business premises. The ground floor will be utilised as shops, whilst the upper floors will be converted into offices and showrooms. An additional storey will be added and is designed as an art gallery. Mr. H. Kempson Dyson, architect, 25 Victoria Street, Westminster, S.W.1, and the work will be carried out by Messrs. Griggs & Son, builders, 100 Victoria Street, S.W.1.

CAMDEN TOWN.—The premises in Camden Town High Street, N.W., owned by Messrs. Marshall Roberts, Ltd., drapers, are to be rebuilt and enlarged. Messrs. Kitching & Archibald, of Middlesbrough, and Mr. M. K. Matthews, of 72 Tottenham Court Road, N.W.1, are the joint architects. The street frontage is about 200 ft. long.

CHEAPSIDE.—The site at the corner of Cheapside and Lawrence Lane, E.C.2, has now been cleared, and the foundations of a block of shops and offices have been commenced. The architects are Messrs. Robert Angell & Curtis, 133 Regent Street, W.1, and the builders are Messrs. G. E. Wallis & Son, Ltd., London and Maidstone.

HOLBORN.—Messrs. Thomas Wallis & Co. are to make extensive additions and erect new shops and showrooms. Messrs. Tetts, Sturdy & Usher, architects, Moorgate, E.C.2.

HORNSEY.—It is proposed to build new additions to the fabric of St. George's Church in Priory Road, N., consisting of a new chapel, chancel and vestries. Mr. W. C. Waymouth, F.R.I.B.A., architect, Gwydir Chambers, 104 High Holborn, W.C.

HOUNSDITCH.—Building operations are in progress on the site of Nos. 49-52 Houndsditch, E.1, where it is proposed to build shops and showrooms, 4 floors in all. The builders are Messrs. Allen Fairhead & Sons, Ltd., of Sydney Road, Enfield. Bronze shop fronts with granite bases and plinths are proposed. Messrs. Stone & Drew, architects, 12 New Court, Lincoln's Inn, W.C.

ILFORD.—The London Congregational Union have selected a site in Woodford Avenue, Ilford, where they propose to build a church. Mr. F. G. Faunch, L.R.I.B.A., architect, 76 Cranbrook Road, Ilford.

KENNINGTON.—Foundations are being constructed for the new "Oval" Telephone Exchange in Kennington, S.E. The builders are Messrs. Galbraith Bros., Ltd., 63 Waterloo Street, S.E.5. Mr. R. J. Allison, F.R.I.B.A., chief architect to H.M. Office of Works, Storey's Gate, Westminster, S.W.1.

KINGSTON-ON-THAMES.—In memory of the late vicar of Kingston, Canon Hyslop, a memorial is to be placed in All Saint's Parish Church, Kingston-on-Thames, and a parish hall is to be built. Plans are shortly to be put in hand.

MINORIES.—The Lands Committee of the City of London Corporation have decided to let on building lease a site in India Street, Minories, E.C. Negotiations are in the hands of Messrs. Herring, Son & Daw, surveyors, Queen Victoria Street, E.C.4.

MITCHAM.—Plans have been approved for the erection, by the Surrey County Council E.C., of the proposed secondary school for girls at Mitcham. Messrs. A. W. Jarvis, A.R.I.B.A., and F. A. Richardson, F.R.I.B.A., architects, 60 Tufton Street, Westminster, S.W.1.

NEWGATE STREET.—Messrs. B. Goodman, Ltd., 88 Haggerston Road, E., are pulling down premises at the corner of Newgate Street and Ivy Lane, E.C., where it is proposed to build a large office block, with shops on the ground floor. Messrs. Griggs & Son, 100 Victoria Street, Westminster, S.W.1, are the builders.

ST. JAMES'S.—Spencer House, in St. James's Place, S.W.1, has been acquired by the Ladies' Army & Navy Club for conversion into new club premises. The plans have been prepared by Messrs. Forbes & Tate, 97 Jermyn Street, S.W.1.

STRAND.—The Civil Service Supply Association have approved their scheme for the enlargement of their headquarters and showrooms in Bedford Street and the Strand, W.C., by the

erection of a building in Agar Street, W.C. The builders are Messrs. Ford & Walton, Ltd., 254 High Road, Kilburn, N.W.8. Messrs. Herbert O. Ellis & Clarke, architects, 3 Old Queen Street, S.W.1.

STRATFORD.—A new wing is to be built at the Queen Mary's Hospital for the East End at Stratford, E.15. The builders are Messrs. H. C. Horsmith, Ltd., Forest Gate, E.7, whilst the architects are Messrs. Newman & Jacques, 61 West Ham Lane, Stratford, E.15. The quantity surveyor is Mr. Sydney Gordon, Finsbury House, Blomfield Street, E.C.2.

SWISS COTTAGE.—The Metropolitan Railway Company have recently approved plans for the complete modernisation of their Swiss Cottage station and buildings. Mr. E. S. Iles, L.R.I.B.A., surveyor to the company.

TILBURY.—At the recent meeting of the Seaman's Hospital Society it was stated that another pavilion was required at the Tilbury Hospital, the cost of building and equipment being estimated at £5,000. The secretary to the Society is Sir James Mitchell.

TOTTENHAM.—A housing scheme is to be carried out on the Churchfields Estate at Tottenham, N., which covers about 30 acres. A lay-out plan shows the proposed building of some 400 houses and shops. The builders are Messrs. H. Wittrick & Co., 36 Camomile Street, E.C.3, whilst the architect is Mr. F. A. Ling, of Bournemouth.

TOTTENHAM COURT ROAD.—Demolition of old buildings has commenced on a frontage in Tottenham Court Road, W.1, where will be erected large "Corner House" premises, shops and restaurants for Messrs. J. Lyons & Co., Ltd., caterers, Cadby Hall, Kensington, W. Mr. F. J. Wills, F.R.I.B.A., architect, 62 Oxford Street, W.1, who will also supervise the construction.

VINCENT SQUARE.—An exhibition hall is being erected in Vincent Square, W.1, for the Royal Horticultural Society. The builders are Messrs. Foster & Dicksee, Ltd., Manresa Road, S.W.8. The plans have been prepared by Messrs. Easton & Robertson, 36 Bedford Square, W.C., the consulting engineer being Mr. Oscar Faber, D.Sc., 37 Duke Street, W.1.

WESTMINSTER.—An extension is being made to a block of offices in Smith Square, S.W.1, called Transport House, the headquarters of the Union of Transport Workers. The architects are Messrs. Culpin & Bowers, 3 Portsmouth Street, W.C.2.

WESTMINSTER.—The Church Army have decided to expend about £15,000 upon the purchase, adaptation and equipment of premises in Greencoat Place, Westminster, S.W.1, as a home for women. The offices of the Army are at 55 Bryanston Street, W.1.

WIMBLEDON.—Further house building by private enterprise is likely by the decision to sell the Banky Field, part of the Wimbledon Park Estate, for development purposes. The purchasers are Messrs. H. Coombs & Sons, builders and contractors, Merton Hall Gardens, Wimbledon, S.W.

Margarine is an interesting addition to the never-ceasing advance in modern methods of hygienic food-production. In no food-product is there so much variation between the different available brands. One may buy margarine which is appetising and palatable. Some margarines are sold that are much less so. Not only must the margarine be wholesome. To stand at the top it must please the palate. Method of manufacture and constant, watchful care of plant characterise the margarine factories of highest grade. No expense is spared on the equipment

of each of the several production departments. The "best available" is a *sine qua non*. In no type of factory is absolute cleanliness of floor and wall surfaces so important and necessary an asset as in a food factory. Not a speck of dirt is allowed in the modern plant of Messrs. Van den Berghs Limited, margarine manufacturers. Their margarine is famous for its splendid quality; the "Blue Band" Brand being universally recognised as the standard of excellence in the trade. The illustrations on this page are from photographs taken in one of their works at Townmead Road, Fulham. Whether it be a concrete floor under a pile of barrels in a big yard, a tiled floor in one of the packing rooms, or a floor of stone and concrete in one of the technical departments—each bit of floor area throughout the plant is so treated that not a speck of dust or particle of disintegrated concrete comes from it. Cleanliness, dustlessness, universal resistance to all forms of wear and tear are the attributes demanded from their floors by Messrs. Van den Berghs Limited. Steel trucks or heavy barrels may clatter and bang over the floors—margarine conditions of manufacture are not gentle where floor surfaces are concerned—but those Van den Bergh floors

"stay put." Every bit of concrete mortar, whatever its function, that is placed in the Van den Bergh factory has "Colemanoid" added to the gauging water. That is the protecting factor. That insures the dustlessness, the resistance to wear and tear, the permanence and cleanliness of the flooring. Write to me at Regent House, Regent Street, London, W.1, and ask for "Colemanoid Floor Specifications," which tells how simply "Colemanoid" may be employed, and at what little extra cost.

Frederic Coleman

The Week's Building News

The following abbreviations are used: U.D.C. for Urban District Council; T.C. for Town Council; R.D.C. for Rural District Council; E.C. for Education Committee; B.G. for Board of Guardians; P.C. for Parish Council; B.C. for Borough Council; M.H. for Ministry of Health; M.T. for Ministry of Transport; C.B. for County Borough; B.E. for Board of Education. Direct confirmation should be obtained before commitments, for which we cannot be responsible, are made.

BIRMINGHAM.—Structural alterations are to be carried out at Bank premises in Witton Lane, and the Bank Committee are inviting tenders for the work. It was stated at a recent meeting of the City Council that the formal sanction of the M.H. to the borrowing by the Council of the following loans had been received: £115,450 for the erection of 212 cottages for accommodation of police; £1,100,000 and £900,000 for the provision of working-class dwellings; £30,325 for the erection of an elementary school at Paget Road; £6,000 in respect of the cost of erecting and equipping new workshops for the blind at Harborne.

BIRMINGHAM.—The Birmingham Entertainments Committee recently granted a licence for the erection of a new super cinema in Monument Road, Edgbaston, which, it was stated, would cost £50,000.

BOLTON.—The E.C. have decided to erect an elementary school at Castle Hill.

BRADFORD.—The Bradford Corporation Estimates Sub-Committee have approved the proposal to erect a new elementary school on the Bierley housing estate at an estimated cost of £24,222.

BRADFORD.—The building of the first block of the new Bradford Royal Infirmary, at Daisy Hill, is to be begun forthwith. The estimated cost is £75,000, and that of the whole scheme £500,000.

BRADFORD.—The site for a new Roman Catholic Church in Norman Lane, Eccleshill, Bradford, has been purchased.

BRIDGWATER.—At a special meeting of the Bridgwater R.D.C. the Housing Committee reported that the M.H. had given sanction to the Council's scheme for providing additional houses in the rural area. The committee recommended that application be made to the Public Works Loan Board for loans of £1,200 for the purchase of sites and £25,600 for building. The recommendation was adopted, as was also a further one to invite tenders for the erection of 8 houses at East Huntspill and 2 at Thurloxton, making a total of 66 houses which have been provisionally approved by the Ministry.

BRIERLEY HILL.—The Church of England school has been condemned, and the Staffordshire E.C. are about to erect new buildings to replace it. The present school is to be converted into a parish hall.

BRUNTON WHARF.—The architects have submitted to the Metropolitan Borough of Stepney pencil drawings of the proposed housing scheme on this site under which it is proposed to erect 27 three-bedroom dwellings with living room and scullery with bath, and 59 two-bedroom dwellings with living room and scullery with bath. In addition to the accommodation mentioned, 10 shops will be provided, and when the plans have been formally approved

by the authorities the Borough will submit a detailed report to the Council upon the subject.

CAMBOURNE.—The U.D.C. are to erect 50 houses of parlour and non-parlour types.

CARDIFF.—The City Engineer has been asked to prepare specifications and invite tenders for additions to the High School for Girls in The Parade.

CHERTSEY.—The U.D.C. propose seeking sanction from the M.H. to the erection of a further 100 houses.

CHINGFORD.—The foundation-stones of the Wesleyan Church were laid on February 19. The building is to be faced with Lawrence's multi-coloured bricks with stone dressings, hand-made tile roof, and oak joinery. The accommodation is for about 500, and the contract amounts to £7,410, and is being executed by Messrs. C. Foster & Sons, of Loughton. The architects are Messrs. George Baines & Son, F.F.R.I.B.A., A.I.Struct.E., of Westminster, S.W.1.

CHISWICK.—The M.H. have given sanction to the borrowing of sums of £7,413 and £5,560 for the erection of 24 houses on the Essex Place land.

CLYDEBANK.—Clydebank T.C. has received the consent of the Scottish Board of Health to borrow £180,418 for the purchase of land at Whitecrook and the erection of 220 houses, and for the purchase of land at West Kilbowie and the erection of 170 houses.

CWMAMMAN.—The U.D.C. propose to erect 10 houses at Garnant.

DALBEATTIE.—The T.C. have selected sites for the erection of 12 houses, and tenders are to be invited.

DEWSBURY.—It was announced at the annual meeting of the Dewsbury and District General Infirmary that it was proposed to invite tenders for the erection of a new infirmary at Moorlands, at an estimated cost of £90,000.

DUMFRIES.—The plans have been passed and permission granted for the erection of an ice factory and cold store in Dumfries. The petition is in the name of Mr. William Milne, 49 Old Wynd, Glasgow, and it is understood that a site has been purchased in Brooms Road; the plant is estimated to cost about £20,000. The premises are to be 133 ft. long by 40 ft. wide, the accommodation consisting of a large store machine room and office.

EAST PRESTON.—The R.D.C. propose the erection of 46 more houses, as follows: Angmering, 6; Clapham, 4; Durrington, 14; East Preston, 4; Ferring, 6; Clipping, 4; Patching, 4; and Goring-by-Sea, 4.

FARSLEY.—The Farsley U.D.C. have decided to build 30 houses, and tenders are invited. Mr. E. Bray, Architect, 115 Town Street, Stanningley, will supply details.

GUILDFORD.—The R.D.C. are to purchase a piece of land at Mays Corner, Send, as a housing site.

HOYLAND.—The U.C. have decided to build a further 50 houses on the Hamshawe Lane site, bringing the total of Council houses to 700.

HULL.—The E.C. now recommend the Corporation to proceed with the scheme for the erection of a technical college at an estimated cost of £150,000.

HULL.—The Finance Committee of the Hull City Council have recommended the Council to approve of the expenditure of £130,000 on buildings in connection with the Hull University College.

certainly approved by the City Council.

ILKLEY.—The Corporation are to erect 56 additional houses on the housing estate.

LANCASTER.—A meeting of the Council is to be convened to consider housing tenders, which include 42 houses in Dorrington Road, 28 in Norfolk Street, and 76 in Slyne Road, making a total of 146. The estimated total cost is £58,400.

LANCASTER.—The Corporation have acquired a site of six acres for a housing scheme, and also approved plans for the erection of 146 houses on various estates.

LEEDS.—Plans are to be prepared for the erection of a new College of Housecraft and Central Technical Institute at Leeds for the training of women and girls. A site at Woodhouse Lane has been already acquired.

LEWISHAM.—Lewisham Hippodrome, one of the biggest theatres in the Metropolis, is to become a cinema.

LLANFRECHFA.—New Council offices are to be erected by Llanfrechfa Upper Council at Clarkeville, Pontnewydd, from the plans of Mr. J. Meazy, the Council's Surveyor.

MANCHESTER.—The Sites and School Buildings Sub-committee reported that it had had before it the plans for the proposed new Roman Catholic School, St. Malachy's, Collyhurst, to accommodate 1,000 children. The plans were sent to the B.E. It had resolved that, subject to the approval of the B.E. and the M.H., a site in Belle Vue Street, Gorton, should be purchased for the erection of a special school. The M.H. had sanctioned the erection and equipment of a new municipal school in Barlow Moor Road; the purchase of a site for a boys' secondary school at Chain Bar, Moston; the appropriation of a site for a special school on the Temple Estate, Cheetham; and additional borrowing powers in connection with the erection of Peacock Street Municipal School. The B.E. had approved the proposed extension of the site of New Moston Municipal School and the proposed site for an elementary school in Briscoe Lane, Newton Heath. The proceedings of the Sites and School Buildings Sub-committee were approved.

NEWCASTLE.—The Housing Committee are presenting a report to the City Council recommending that a

MARSEILLES
ROOFING — TILES

further 15 houses be added to the existing contract of Mr. G. G. Carr, at the same price per house as provided for under the contract for 34 houses. The above houses are to be erected on Section "C," Walker Estate.

NEWCASTLE.—The plans have now been passed for the proposed new Mining Laboratory in connection with Armstrong College, Newcastle, and it is hoped to commence the work of construction within the next few months. The new Mining Laboratory has been designed by Mr. A. Dunbar Smith, F.R.I.B.A., of Bloomsbury, who was responsible for the Library at Armstrong College, opened last year.

NEWPORT (MON).—A report has been presented to the Parliamentary and Improvements Committee with reference to the Town Hall site and Clytha Park site for a civic centre.

OSSETT.—Viscount Burnham is to lay the foundation-stone of extensions to the Ossett Grammar School on March 8, which, it is estimated, will cost £15,000. The new buildings will be of brick, with stone facings. They will be three-storeyed, and will contain an assembly hall, a gymnasium, four class-rooms, a practical geography room, an art room, a laboratory, a cookery room, a dining room and kitchen, and cloak rooms. The plans have been prepared by Mr. H. Wormald, architect to the West Riding E.C.

PENMAENMAWR.—Mr. R. J. Hughes, Architect to the Council, has submitted fresh plans for the erection of 38 instead of 28 houses to complete the Council's scheme. The architect suggested that there should be a reduction in cost from approximately £565 per house to £420. Fresh tenders will be asked for.

PONTNEWYDD.—New Council offices are to be erected by Llanfrecgfa Upper Council at Clarkeville, Pontnewydd, from the plans of Mr. J. Meazy, the Council surveyor.

PREESALL.—The Council has under consideration the question of providing new municipal offices. Negotiations have been opened with owners of premises, and the Surveyor has been instructed to prepare a scheme for enlarging the existing offices.

PWLLHELI.—The H.C. has received sanction from the M.H. to erect 20 more houses. Mr. C. Lloyd Roberts, Borough Surveyor, was appointed surveyor to the new scheme.

SALFORD.—The Corporation Health Committee recommend the appointment of Mr. T. Harold Hill, A.R.I.B.A., of Altrincham, as architect for the proposed maternity and welfare centre in the Ordsall district.

SHEFFIELD.—Among the plans approved by the Committee of the City Council during the past month are those for shops, offices, café, etc., for the Brightside and Carbrook Co-operative Society, 174 houses on the Wadsley Hall estate for the Sutton Trust, and 33 houses in Todwick Road for Mr. E. Cooper.

SHEFFIELD.—The City Architect has prepared a lay-out for the erection of 116 parlour houses and 50 bungalows on the Ridgeway Road site.

SHEFFIELD.—The Sutton Trustees are to erect 175 houses on the Wadsley Hall estate, Sheffield.

SOLI HULL.—The governors of Solihull Grammar School, Warwickshire, are to prepare plans for the extension of the buildings.

SOUTH DEVON.—Contemplated extensions to the South Devon and East Cornwall Hospital, Plymouth, which will involve a cost of approximately £40,000, are referred to in the report for 1926, which will be presented to the governors of the institution at their 87th annual meeting on March 10. If the scheme is realised the institution will be the largest voluntary hospital in the West of England.

ST. JOHN'S WOOD.—The Central London Building Company are to erect flats in Curcus Road and Grove End Road, St. John's Wood.

STOKE-ON-TRENT.—A proposal for erecting a workmen's hostel was re-

STOURBRIDGE.—Stourbridge Wesleyan Church, which was erected in 1805, is to be pulled down to make way for a new church, costing £10,000.

STOURBRIDGE.—The work of demolishing the Wesleyan Church premises, which were erected in 1805, will be started shortly, in readiness for the beginning of the new buildings. The architects are Messrs. Crouch, Butler & Savage, of Birmingham, and the cost of the scheme will be about £10,000.

TAVISTOCK.—At Tavistock R.C. meeting recently it was reported that work on the new Council houses at Buckland Monachorum had commenced and that the Lifton work was in hand. The district valuer had approved the purchase of half an acre of land at £70 for the building of 4 houses at Sampford Spiney, and the Housing Committee recommended the Council to invite tenders for the erection of the houses. The tender of Messrs. W. Dart & Son, of Dawlish, at £7,659, was accepted for the Bere Alston water scheme.

TETTENHALL.—It was recently announced at a Tettenhall U.D.C. meeting that it was proposed to purchase The Oaklands, Upper Green, for conversion into new Council offices. The official sanction of the M.H. is being sought, as well as permission to borrow money for the purchase of the property.

WALTHAMSTOW.—The U.D.C. have decided to erect 36 additional houses on the Fitzwygram estate, Forest Road.

WESTMINSTER.—Flats costing about £30,000 are to be built in Willow Street by Westminster Council.

WOLVERHAMPTON.—The Committee of Management of the Eye Infirmary are to erect in the garden grounds a home for nurses and staff. The home will entail an expenditure of possibly £8,000. Preliminary work has commenced on new extensions, to cost £45,826, at Wolverhampton and Staffordshire Hospital. The T.C. are to proceed with the erection of abattoirs and cold stores, and are inviting tenders for the work. The quantities have been prepared by Mr. Henry Vale, F.S.I., of Wolverhampton.

WORCESTER.—The Watch Committee are to erect a fire engine station at 13 Copenhagen Street, with accommodation, subject to the M.H. sanctioning the borrowing of the cost, £2,000.

Sheffield Markets Scheme

The scheme of the Sheffield Markets Committee for the reorganisation of the markets was recently submitted to the City Council. It is proposed to move the present site of the Fitzalan Market to a plot of land in Exchange Street, and to make the entrance to the market through arcades in the buildings of the Brightside and Carbrook Co-operative Society. The scheme is contained in the following report of the committee: "In our opinion the first requisite is to obtain control of the site of the Fitzalan Market Hall, which is of considerable value, and is not being adequately utilised at the present time. We have further considered the question of re-establishing the tenants of that market, and on our instruction the city architect has prepared a scheme for utilising a plot of land near Exchange Street, situate at the rear of premises about to be built by the Brightside and Carbrook Co-operative Society on land sold to them by the Corporation. Access to this site can be obtained through two arcade entrances leading from Exchange Street through the Co-operative Society's premises to the site, and also from Waingate. The proposed site contains an area of 3,748 yards, and will afford more accommodation than the present accommodation of market stalls in the Fitzalan Market Hall. The proposed building will be a one-storey market hall, the estimated cost of which will be approximately £35,000."

Edinburgh and Leith Plumbers

At the annual general meeting of the Edinburgh, Leith and District Master Plumbers' Association, held in Dowell's Rooms, 18 George Street, Edinburgh, the following were elected office-bearers for the ensuing year: President, Mr. James Beek, 101 Hanover Street, Edinburgh; vice-president, Mr. Peter Lister (Messrs. Patrick Knox & Sons), 31 Crichton Place, Edinburgh; secretary and treasurer, Mr. J. Ferguson Reekie, S.S.C. (Messrs. Ferguson Reekie & Co.), 22 Great King Street, Edinburgh; auditor, Mr. W. D. Stewart, C.A., 3 Albany Street, Edinburgh.

Scotland's "Olympia"

The new Kelvin Hall at Glasgow, which occupies the site of the former structure, destroyed by fire in 1925, is expected to be finished in time for the Royal visit in July. This structure is bigger than London's Olympia, and will have probably the largest concrete roof in the world. There will be three spans, 110 ft. wide and 455 ft. long, with a side span 110 ft. wide and 330 ft. long. The total superficial area of the roof will be 24,000 square yards.

The Burgh Surveyor, Mr. David Galloway. Offers to Mr. Alexander S. Black, Town Clerk, Oban.

OLDBURY.—March 8.—For the erection of 56 houses (brick-built) on the Londonderry Farm estate, Warley, Oldbury. Also for the erection of a further 60 houses (brick-built) on the same estate. Mr. W. Greenwood, M.I.M.&C.E., Engineer and Surveyor, Council Offices, Oldbury. Deposit £2 2s.

PENICUIK.—For the construction of 12 houses in Penicuik, being the sixth development of their scheme: Excavator, brick and concrete work; carpenter, joiner and ironmonger work; plumber and gas-fitting work; plaster work; slating and harling

work; glazier work and painting work. Mr. James Gray, A.R.I.B.A., 140 Princes Street, Edinburgh.

PUDSEY.—March 12.—For 18 parlour and 78 non-parlour type houses for the Corporation, on the Southroyd Park estate. B. H. Noble, M.I.M.C.E., Borough Surveyor, Town Hall, Pudsey. Tenders for all or part. Deposit £3 3s.

SEISDON.—March 8.—For the erection of four houses on the Halfpenny Green site, Bobbington; six houses on the Blundies Lane site, Enville; four houses at Orton Lane, Lower Penn; twelve at Smestow Road, Swindon; six at Fiershill, Trysull; six at Seisdon (near Seven Stars Inn), Trysull; and twenty at Bratch Road, Wombourn, for the Seisdon R.D.C. The Council's Architect, Mr. H. Marcus Brown, L.R.I.B.A., 45 Queen Street, Wolverhampton. Deposit £2 2s.

SMETHWICK.—March 7.—For the erection of 14 parlour type houses, and 92 non-parlour type houses, at Varley, Oldbury. Mr. Roland Fletcher, Assoc.M.Inst.C.E., Borough Engineer and Surveyor, Council House, Smethwick. Deposit £5 5s.

SOMERSET.—For the erection of a detached cottage at West Horrington, near Wells. The County Architect, Lloyds Bank Chambers, Weston-super-Mare.

SOUTH FARNBOROUGH.—March 7.—For alteration and additions to South Farnborough Working Men's Club, York Road, Farnborough. The Secretary, South Farnborough Working Men's Club, York Road, Farnborough.

STAINES.—March 12.—For the erection of 48 houses at the following housing sites: Ashford Common, Ashford, 10 houses; Staines Road, Laleham, 10 houses; Stanwell Moor, Stanwell, 12 houses; Sipson Site, Harmondsworth, 16 houses. Mr. R. A. Hogarth, Clerk to the Council, London Road, Ashford, Middlesex. Deposit £2 2s.

Scottish Wage Dispute

Two thousand labourers in the building industry in Glasgow and the West of Scotland struck work recently to resist a reduction in wages from 1s. 3½d. to 1s. 1½d. per hour, which has been put in operation by the Scottish Building Contractors' Association. The districts affected are Glasgow, Paisley, Greenock, Coatbridge, and Falkirk. The stoppage is not a general one, as there is another employers' organisation which has not reduced wages.

New Capital of Afghanistan

The Emir of Kabul has engaged Dr. Harten, a German architect, to plan and lay out a new town a short distance from Kabul, which, when completed, will be the capital of Afghanistan. The plans provide for a Government House, palaces for Ministers, Foreign Ambassadors, and one for the Emir himself.

Building Tenders Accepted

ABERDEEN.—Acceptance of tenders for the dancing hall, variety pavilion, shops and other buildings, to be erected at the Beach, amounting to over £53,300, was recently approved of by Aberdeen T.C.

BASFORD.—A tender amounting to £43,897 has been recommended for acceptance for the building of a school at Basford, Notts.

BOLTON.—The Corporation Housing Committee have accepted the tender of Messrs. A. Braithwaite & Co., Ltd., of Leeds, for the erection of 118 houses at the Higher Swan Lane estate.

BOLTON.—The Corporation Housing Committee have accepted the following tenders for the erection of houses on the Moorfield housing estate: Messrs. J. W. Lee, Ltd., of Chorley, for 102 houses; Messrs. William Townson & Sons, Ltd., of Bolton, for 28; and Messrs. A. Braithwaite & Co., Ltd., of Leeds, for 182.

BRIDGWATER.—The Housing Committee reported having considered tenders for the erection of 56 houses, an instalment of the Council's proposed scheme, and they recommended that, subject to the approval of the M.H. to the acquisition of the required sites, and to sanctions to the borrowing of the necessary sums for the acquisition of the sites and building of the houses being obtained, the following tenders be provisionally accepted: Bawdrip, Mr. F. J. Cox, £1,810 10s.; Cannington, Messrs. H. W. Pollard & Son, £2,585; West Huntspill, Messrs. Sheppard & Son, £3,690; North Petherton, Messrs. Clatworthy & Son, £2,650; North Newton, Messrs. Clatworthy & Son, £1,820; Over Stowey, Messrs. H. W. Pollard & Son, £3,265; Othery, Mr. W. Palmer, £1,710 0s. 9d.; Otterhampton, Messrs. H. W. Pollard & Son, £1,849; Pawlett, Mr. E. Granville, £930; Puriton, Mr. H. J. March, £1,840; Stawell, Mr. R. T. Hanham, £908 (plus £30 for well); Wembdon, Messrs. H. W. Pollard & Son, £1,739. The committee further recommended that formal application be made to the M.H. for sanction to the borrowing of the sum of £1,200 for the purchase of sites, and £25,600 for the purpose of building and contingencies, also that, with a view to expediting sanction to the Council's scheme, the Clerk and Surveyor be authorised to wait on the Ministry to present tenders, plans and recommendations to the Council.

DUDLEY.—The Corporation Housing Committee recommend the tender, £18,976, for Messrs. A. J. Crump & Sons, Ltd., of Dudley, for the erection of swimming baths at Blowers Green.

FARMFIELD.—For the erection of six two-storey cottages at Farmfield. J. Crewdson, Horley, £3,400 (accepted); W. H. Gaze & Sons, Ltd., Kingston, £3,473; Pink & Oram, Redhill, £3,691; A. King & Son, Horley, £3,880; R. Cook

& Sons, Ltd., Crawley, £3,944 7s. 6d.; T. J. Lovell & Son, Paddington, £4,064; T. Wickens & Son, Charlwood, £4,250; E. E. Mitchell, Horley, £4,534; E. H. Cummins & Co., Dorking, £4,840.

HORLEY.—The L.C.C. have accepted the tender, £3,400, of Mr. J. Crewdson, of Horley, for the erection of cottages for the staff at Farmfield Colony, Horley.

HOYLAND.—The Hoyland U.D.C. have accepted the tender of Mr. C. P. Unwin, of Ecclesfield, for 28 small type houses at £307 per house, and that of Messrs. Fairhurst Bros. for 22 large type houses at £435 per house.

KINGSTON-ON-THAMES.—The T.C. have decided to erect 58 houses on the housing estate near Cambridge Road, and to accept the tender of Messrs. W. H. Gaze & Sons, at £490 per house.

LEAMINGTON.—For the erection of a new Institute and Sunday Schools for the trustees of Dale Street Wesleyan Methodist Church. Messrs. Quick & Lee, Architects, 11 Waterloo Place, Leamington Spa. The Exors. of the late Mr. R. Bowen, 3 Tavistock Street, Leamington Spa, £7,337 (accepted).

MIDDLESEX.—The E.C. of C.C. have accepted the following tenders: For the adaptation of school buildings at Bishopshalt, to provide accommodation for 405 pupils, Mr. W. S. Try, of Cowley, at £30,407; for the enlargement of the Townfield Council School, Hayes, Messrs. Fassnidge and Sons, Ltd., of Uxbridge, £10,697; and for the enlargement of the West Drayton Council School, Mr. G. Challis, of Brentford, £8,729.

NANTWICH.—The U.D.C. has accepted the tender—the lowest received—of Mr. Peter McLachlan, of Latchford Without, for the erection of 28 additional houses on the Wallfields site, the figure being £14,033 12s. It was resolved to apply for sanction to borrow the necessary sum.

NEWHAVEN.—Having received the Housing Sub-Committee's report, the committee recommended that it be approved, and that the tender of Messrs. Sherren, Ltd., for the erection of 41 houses at £19,095 be accepted.

NUNEATON.—The T.C. have accepted the tender of Messrs. G. Cooper & Sons, Ltd., of Nuneaton, for the erection of 36 houses in Hill Street and Short Street, at £8,361 for Section 1, and £4,991 for Section 2.

SALFORD.—The Corporation Housing Committee now recommend the tender, £9,780, of Messrs. F. E. Gill & Sons, of Trafford Park, for the erection of 17 houses on the Weaste estate, in lieu of a tender, previously recommended, of £8,765, from the Exors. of Elijah Murphy.

SHEFFIELD.—The Corporation Housing Committee have accepted the following tenders for the erection of houses on the Longley estate: Messrs. Maxfield Bros., 63 at £24,385; Messrs. Dyson & Co., 29 at £11,201; Messrs. R. T. Hinchliffe & Sons, 36 at

£14,626; Messrs. H. Tėanby, Ltd., 10 at £5,000; Messrs. M. J. Gleeson, Ltd., 20 at £7,875.

SHEFFIELD.—The Corporation Watch Committee have accepted the tender, £497, of Mr. C. W. Alfhat, for the erection of a temporary fire station on the Manor Housing Estate.

ST. PANCRAS.—For the erection and maintenance of the necessary buildings, and the adaptation of the existing premises on the Holly Court site, St. Pancras, N., as a day open-air school. H. Lacey & Sons, Hazlebury Crescent, Luton, Beds., £4,238 19s. 7d. (accepted); Stevens & Sons, Crouch Hill, £4,436; Humphreys, Ltd., Knightsbridge, £4,582 10s.; L. Kazak, Hampstead, £4,614; W. M. Brand, Stamford Hill, £4,649; J. C. Mather & Son, East Finchley, £4,879; Rowley Bros., Ltd., Tottenham, £5,023; G. Godson & Sons, Ltd., N. Kensington, £5,049; A. Monk, Lower Edmonthon, £5,051; J. Wilmott & Sons (Hornsey), Ltd., Hornsey, £5,068 15s. 1d.; B. Colley & Sons, Ltd., Holland Park, £5,069; F. Cottrell, Ltd., Crouch Hill, £5,109 11s. 11d.; Marrable Bros., Leytonstone, £5,215; C. H. Boyd & Son, Ltd., Lancaster Gate, £5,252; Howard Farrow, Ltd., Golders Green, £5,375 16s. 6d.; G. N. Watts, Ltd., Notting Hill, £5,489; A. & F. Polden, Ltd., Shepherd's Bush, £5,940.

STREATHAM.—For the erection of a permanent school in the place of the Furzedown temporary school (Streatham). Soole & Son, Ltd., Dunstable Works, Sheen Road, Richmond, £14,329 3s. 5d. (accepted); W. H. Gaze & Sons, Ltd., Kingston-on-Thames, £14,473; J. Garrett & Son, Balham Hill, £14,605; Rowley Bros., Ltd., Tottenham, £14,703; Triggs & Co., Clapham, £14,873; Perry Bros., Ealing, £15,036; J. & C. Bowyer, Ltd., Upper Norwood, £15,117; Higgs & Hill, Ltd., South Lambeth Road, £15,150; J. E. Billings & Co., Ltd., Victoria Street, £15,359; J. Marsland & Sons, Ltd., South Molton Street, £15,369; Prestige & Co., Ltd., Westminster, £15,522; Thomas & Edge, Woolwich, £15,546; W. Akers & Co., Ltd., South Norwood, £15,628; J. Smith & Sons (Norwood), Ltd., South Norwood, £15,650.

THORNBURY.—The R.D.C. has accepted the tender of Messrs. Keynton & Sons for the erection of eight houses at Charfield for £3,332.

WEYMOUTH.—For the erection of additions and alterations at Nurses' Home for the Secretary. Messrs. Crickman & Sons, architects. Messrs. Justy & Baker, Weymouth, £3,840.

Trade Note

Messrs. The Agricultural & General Engineers, Ltd., announce that Sir Charles E. Low, K.C.I.E., formerly Secretary to the Commerce and Industry Department of the Government of India, and a member during the War of the Indian Munitions Board, has been appointed to take charge of the Indian interests of the 14 engineering firms it controls.

HY-RIB

The Combined Reinforcement and Centering

HY-RIB IS THE PERFECT BASE FOR PLASTER AND CONCRETE

Note the design of the mesh as a key for cement plaster

The general advantages of Hy-Rib as a combined reinforcement and centering have been generally accepted. This material, manufactured from the best British steel at our works at Trafford Park, Manchester, has been sold in increasing quantities for the past twenty years until the present time, when it is used at the rate of thousands of square yards per day.

USE HY-RIB AND ELIMINATE CLOSE-BOARDED SHUTTERING.

THE CARNEGIE MODEL MATERNITY AND CHILD WELFARE CENTRE, MOTHERWELL.

Architect: W. M. Bishop, L.R.I.B.A.

Contractor: George Byson.

Hy-Rib reinforcement was used for all the reinforced concrete work.

Hy-Rib inquiries and orders are expeditiously dealt with.

Hy-Rib is supplied cut to length ready for fixing.

Hy-Rib can be delivered, when required, curved ready for fixing, thus saving expensive labour on the site.

Working drawings are prepared to assist the contractor in fixing Hy-Rib simply, speedily, and economically.

Hy-Rib is bundled and carefully marked to coincide with the working drawings.

The 1927 edition of the Hy-Rib Handbook, containing detailed information, will be forwarded on application.

The British Industries Fair

(Continued)

Building B). This heater is proving to become an efficient substitute for central heating.

MESSRS. THE LIGHTFOOT REFRIGERATION Co., LTD., of 35 Queen Victoria Street, London, E.C. (Stand No. 111, Building C), are showing an "Ellar-cold" Automatic Refrigerating Machine in operation, cooling a cabinet of 20 cb. ft. capacity. All the internal parts of this cabinet are finished in vitreous enamel.

A comprehensive display of standard electrical accessories, including switches, lampholders, wall sockets and plugs, and electrical switchboard gear, is exhibited by MESSRS. J. H. TUCKER & Co., LTD., of King's Road, Tyseley, Birmingham (Stand No. 67, Building C).

Motors and electrical equipment for all purposes, switch and control gears, lamps, fittings and accessories, are the chief feature of Stand No. 48 (Building C), occupied by MESSRS. METROPOLITAN-VICKERS ELECTRICAL Co., LTD., of Trafford Park, Manchester.

MESSRS. CALLENDER'S CABLE AND CONSTRUCTION Co., LTD., of Hamilton House, Victoria Embankment, London, E.C. (Stand No. 30, Building C), are showing electric cables and distribution boxes; "Kalanite" Insulating Material, and the Callender "Kalceco" wiring system.

Several new types of electric motors for industrial drives and fractional horse-power motors for domestic duties, are at Stand No. 21 (Building

C), occupied by MESSRS. THE BRITISH THOMSON-HOUSTON Co., LTD., of Rugby. At this stand there is also a display of fittings for industrial, office and domestic lighting.

A representation of the complete range of electrical apparatus manufactured by MESSRS. THE GENERAL ELECTRIC Co., LTD., of Magnet House, Kingsway, W.C.2, is to be found at Stands No. 1-3 (Building C).

MESSRS. JENKINS BROS., LTD., of 6 Great Queen Street, Kingsway, W.C.2 (Stand No. 252, Building B), are exhibiting renewable disc globe valves in gunmetal and iron, quick-opening valves, and radiator valves.

The "Centigrad" Patent Dust Control Unit for removal and collection of dust from manufacturing processes is shown in operation by MESSRS. MUSGRAVE AND Co., LTD., of St. Ann's Iron Works, Belfast, at Stand No. 233 (Building B), together with the "Zephyr" Cooler for providing a current of cool air where workers are exposed to excessive heat.

"Betonac" Steel Concrete Units, showing steel concrete finish to the exposed surface, and giving the wearing qualities of granite, are exhibited by MESSRS. THE FRANCOIS CEMENTATION Co., LTD., of Bentley Works, Doncaster (Stand No. 211, Building B).

At Stand No. 182 (Building B), MESSRS. CHARLES WINN & Co., LTD., of Granville Street, Birmingham, have a display of "Winn" valves and fittings for steam, water and gas, supplemented by fire extinguishing appliances.

The "New Junior" Glow-worm Coke Boiler and the new "Glow-worm" Open Coke Fire are shown in use at Stand No. 153 (Building B), by MESSRS. O. BRUSTER & RICHARDSON of 4 Lloyd's Avenue, London, E.C.3. The "New Junior" Boiler is claimed to have the largest open fire of any boiler on the market; the Open Coke Fire has been specially designed for burning coke in an open grate, but will consume almost any class of fuel.

Stand No. 133 (Building B), occupied by MESSRS. D. ANDERSON & SON LTD., of Park Road Works, Stretford, Manchester, has for its central feature a model of a "Belfast" Lattice Girder Roof covered with "Rok" Roofing, showing the construction in full detail. Rolls of "Rok" Roofing and the new mineral-surfaced "Rok," Sanodex Odourless Felt, and Stoniflex Roofing Felt, are also on view.

Labour-aiding appliances, consisting of an installation of gravity roller conveyor, vertical elevator and incline belt and lowering apparatus for factories and warehouses, are exhibited by MESSRS. W. & C. PANTIN, of 14 Upper Thames Street, London, E.C. (Stand No. 109, Building B).

"Chubb" Fire and Thief Resisting Safes and Strong Room Doors of various qualities; steel racking, shelving and fittings, with locks and latching of all types, including a special line of cheaper quality mortise locks, are shown by MESSRS. CHUBB & SON LOCK AND SAFE Co., LTD., of Wolverhampton, at Stand No. 111a (Building B).

Ditto, for licences from Borough Councils	say £1
Allow for mess and material sheds, offices, &c.	from £50
Hoardings complete	Per Foot Run 5/-
Planked gangway with handrail complete	4/-
Proper gantry complete	40/-
Sleeper roadways	8/-
Needling, strutting or shoring, including all labours and use and waste in erection and removal	Per Foot Cube 5/-
DEMOLITION	
Pull down brickwork	Per Ft. Super reduced. In small quantities 6d. In considerable quantities 2d.
Add, if in very small quantities not exceeding 21 ft. out to carts	3d.
Add for filling baskets with debris and running same	1 1/2d. 1 1/2d.
Add if debris has to be raised or lowered to ground level	2d. Usually dropped
Add for cartage when same costs 4/6 per 1 1/2 yard load	2 1/2d. 2 1/2d.
Clean and stack old bricks	20/- per thousand
Hack off old plaster	1/- per sq. yd.

EXCAVATOR, CONCRETOR AND DRAINS.

Excavate in common soil, wheel, fill carts and cart away	Per Yard Cube 5 ft. 5 ft. to 10 ft. deep 9/6 11/- 9d.	Add if in trench
Planking and strutting	4d. per foot super.	
Planking, strutting and shoring	1/- " "	
Portland cement and ballast	1 to 6 29/6 36/6 2/6	Hoisting
Concrete in foundations	2/- 2/10 2/6	
Add if in ground floors	3/- 4/- 2/6	
Add if in beams or lintels		
Tested stoneware drains jointed in cement or standard iron drains jointed in lead, per foot run ..	4 in. 6 in. 4 in. 6 in. 2/- 3/- 3/- 4/6	
Extra only for bends, each	2/6 3/6 11/6 20/-	
Ditto, for junctions, each	3/- 4/3 19/- 35/-	
Gullies, including concrete surround and iron grating, each	16/- 18/6 35/- 50/-	

BRICKWORK (Exclusive of Pointing).

Built in 1 to 3 lime mortar	Per Rod Reduced Flettons 620/- Stocks 830/- Blues 1060/-	
" " cement mortar	640/- 850/- 1080/-	
Damp course		
Two courses of slates in cement	Per Foot Super Horizontal 10d. Vertical 1/3	
2-in. asphalt	9d. 1/-	
Facings		
Allow for every 5s. additional cost of the facing bricks over the common brick basis	Per Foot Super Flemish bond English bond 1d. 1d. plus 10%	
Pointing (exclusive of scaffolding)	Per Ft. Super 2 1/2d.	
Weather joint in cement	2 1/2d.	
Flat joint in cement (struck) and lime whitening	1 1/2d.	

ARCHES.

Extra over common brickwork	Per Ft. Super 1/-
In half-brick rings of bricks of same class as common brickwork ..	1d.
Add if of superior bricks for every 7/6 per thousand additional cost ..	6/-
In rubbed and gauged arches with fine joints	Per Ft. Run 6/-
Quoins, angles, copings and sills of superior bricks	Per Ft. Run 6/-
Allow for every 5s. per thousand additional cost of bricks over the common basis price	1d. plus 10%
Double-tile creasing and cement fillets and pointing to 9-in. wall ..	1/2

PAVIOR.

Cement and sand	1 in. 3/-	1 1/2 in. 3/5	Per Yard Super 1 1/2 in. 3/10	2 in. 4/8	3 in. 5/3
Granolithic	4/2	4/9	5/3	6/4	6/
Asphalte	7/-	—	—	4/8	6/
Tarmac	—	—	—	—	—

MASON.

York stone and all labours and mortar in hoisting and fixing	Per Foot Cube Templates 12/6 Thresholds 16/6	Stairs 9/-	11/
Artificial stone	8/-	To Elevation generally 19/6	10/6
Portland stone and all labours of usual character	19/6		
Bath stone ditto	10/6		

SLATER AND TILER.

Welsh slating laid to a 2 1/2-in. lap with two composition nails to each slate	Per Square Counters 80/- Ladders 72/-	
Add for every 1/2-in. additional lap	2/3 3/7	
Add for copper nails	2/3 3/4	
Best selected green Westmorland slates laid to a 3-in. lap, with copper nails	135/-	
Asbestos slates laid to a 3-in. lap, with compo. nails	41/-	
Asbestos corrugated roofing with galv. screws and limpet washers ..	60/-	
Plain red roof tiling 4-in. gauge, each tile in every fourth course nailed with two galv. iron nails	70/-	
Add for vertical work	2/-	
Add for circular on face in elevation	25/-	
Add for circular on plan, according to radius	40/-	
Add for circular on face in elevation and also on plan according to radius ..	56 1/2/-	
Old Delabole slates fixed complete—		
Size Medium Grey Medium Green		
24 x 12 in.	90/- 93/-	Per square
20 x 10 in.	95/- 100/-	Ditto
16 x 10 in.	86/- 91/-	Ditto
14 x 8 in.	80/- 86/-	Ditto
Green Randoms No. 2	115/-	Ditto
Grey-Green Randoms	98/6	Ditto
Green Peggles 12 in. to 8 in. long	87/6	Ditto
Cuttings—Eaves	Per Foot Run	
Edges and abutments	Equal 1 foot super	
Ridge tiling	Equal 1 foot super 1/10	
Fixing soakers	9d. per dozen.	

CARPENTER.

Flat boarded centering, per yard super	5/-
Centering to beams, per yard super	7/-
Centres to arches, per foot super	2/-
Fir framed in carpenter's work per ft. cube	Plates 4/- Floor 6/- Roofs 5/10 Trusses 8/9
At per square	1 1/2 in. 1 in. 1 1/2 in.
Deal close boarding	31/- 38/- 48/-
Battening for slates	10/- 11/- 12/-
Roofing felt lapped and laid	12/- to 20/-
Gutter boards and bearers per foot super	1/-

JOINER.

Per square	1 1/2 in. 1 in. 1 1/2 in.	1 1/2 in. 1 in. 1 1/2 in.
Deal plain-edged flooring	2/- 2/3 33/-	40/- 50/- 58/-
Deal tongued and grooved flooring	37/- 45/- 56/-	58/- 66/- 68/-
Deal matching	36/- 43/- 46/6	
Sashes, per foot super	1 1/2 in. 1 in. 1 1/2 in.	2 1/2 in. 2 in. 2 1/2 in.
Deal moulded sashes, divided in squares	1/10 1/10 1/10	
Windows, per foot super	Very small Small Normal Large	
Deal cased frames, 1-in. linings, 1 1/2-in. pulley styles, 2-in. sashes in squares, oak sill, double hung with pulleys, lines and weights ..	11/- 5/- 3/6 3/-	
Doors, per foot super	2 in. 1 1/2 in. 1 in. 1 1/2 in.	
Square frame both sides doors	Panel 2/3 2/5 2/5	Panel 2/5 2/5 2/5
Add for each side moulded	2 1/2d. 3 1/2d. 4d.	4d. 4d. 4d.
Add for each side bead butt	4d. 4d. 4 1/2d.	5d. 5d. 5d.
Doors of hardwood such as oak or mahogany, will cost three times as much exclusive of polishing.		
Staircase.		
1 1/2-in. Deal tread, 1-in. riser, fixed complete per foot super	2 in. 2 in. 2 in.	
2-in. Deal strings, per foot super	2 in. 2 in. 2 in.	
Housing steps to strings, each	2 in. 2 in. 2 in.	

GLOW-WORM

*Which Boiler
do you
Specify?*

The best, cheapest and most modern way to raise abundant Hot Water for Baths, Lavatory Basins, Sinks and, where desired, Radiators, is by means of a Glow-worm Stove Boiler

The Glow-Worm differs from all other Boilers on the market.

Every Glow-Worm, except the Minor, is fitted with a Shaking Bottom, which permits of easy stoking and allows dust and ashes to be removed without their coming into the room. Anyone who has had any experience at all of Boilers knows what a boon this is. The Glow-Worm is also amazingly economical. It is far

cheaper to run than ANY other boiler on the market—an important point, you will agree.

And finally, all Glow-Worm Boiler bodies carry a guarantee against fracture. This, too, is very important and should induce every far-seeing householder, thinking of a Boiler, to insist upon the Glow-Worm.

There is no other Boiler in the world that has all the features of this favourite model. Neither is there any Boiler that is so efficient as a raiser of Hot Water.

Prices range from £8 10s.

MORE ON REGISTRATION

We make no apology for a further reference to this important subject, which is now nearing discussion in Parliament. We understand that the Registration Bill will come up for second reading on April 8th, and it is desirable that all architects, who wish to see the educational standard of the profession raised, should impress that fact on the members of Parliament who represent them. The architect can have no monopoly on the technical side of building; but it is vital that his claim to æsthetic qualifications should be recognised, and that he should fit himself by adequate training to earn that acknowledgement. Without registration, it is impossible for the public to have any assurance that the architect is at all fitted to give the advice and counsel that it seeks, and that fact militates both against the public and the art of architecture. The architect must command the respect of the public before he can hope to enjoy its confidence. There is no "universal art of architecture"; there may be a universal art of building, which ranges from a mud and wattle hut to an American skyscraper. Architecture only begins when the putting together of the material is so ordered as to endow the resulting building with an architectonic value. We do not deny that that has been done, unconsciously, by men of no æsthetic training; but an art like architecture cannot depend for recognition on what the schoolboy would call "flukes." We are told that Registration implies a dead level of mediocrity. What of it? When has there ever been, since the world began, an art or a profession, the bulk of whose votaries has risen above a dead level of mediocrity? We hear of the great masters, but what of the great mass? Even in the arts of painting and sculpture, to-day, can it be said that the majority of their followers are above the mediocre line? The general level of attainment may be higher, and that may be a reason why the genius is less apparent. When all the trees in a wood are tall, it is less easy to pick out the ones that overtop the rest. And it is just that levelling up in the general standard of taste and erudition which we look to Registration to accomplish. Most painters and sculptors have spent many years in ateliers and schools, training for their work, competing with their fellows, criticising each other's efforts, criticising

their own in the light of others' accomplishments, discussing and debating points of treatment, and always exposed to the watchful supervision and criticism of their professors and masters. Our architectural schools have now established a similar régime for the architectural student, who in many respects follows a more responsible art, since one cannot escape it and its exposition must be carried out in expensive and enduring materials. It is contended, however, that the scholastic training must tend to produce a stereotyped architecture, to stifle originality. Well, there has been a good deal of originality in the last half-century that we gladly would have missed; but we fail to understand why, since originality has not been stifled by the art schools, such a dire result must necessarily follow analogous training in the architectural schools. We are glad to see Professor Reilly joining in *The Times* discussion to point out that scholastic training has not fettered initiative in the United States; still less does such training stifle originality on the Continent. The crushing of the spark of genius is an old bogey with the anti-registrationists who one must class, seemingly, with the Bourbons as a race that forget nothing and learn nothing. Professor Reilly, however, is unduly optimistic, we think, in looking to Registration to remove "The Bungalow Menace." That threat belongs to the universal art of building which the proposed measure will not touch; the most that one can hope from Registration is that the responsibility for "this rash upon the countryside" will be removed from the architects' shoulders. A very large proportion of the body politic, we fear, connotes the employment of an architect with the erection of a new building; and would hardly credit any assertion to the contrary. Registration would go far to correct such fallacious beliefs; and in so doing might tend to raise the public taste and appreciation of architecture. Though one or two voices in the profession have been raised against Registration, we do not believe they seriously oppose it; their objections are founded upon details rather than upon the principle. But it is not easy to satisfy everybody's desires on the matter; and over some of the demands it would be impossible to get the Legislature to agree. A section of the profession, for instance, would shut out all those practising to-day

who have not passed a qualifying test. It is needless to say that Parliament would never sanction such a provision. Even in the case of dentists, the most recent instance of compulsory registration, it was found necessary to include on the first register all

those practising at the time of enactment, whether they were qualified or not. The Royal Institute we are assured, is anxious to meet all reasonable claims on the Registration question, but nothing is to be gained by crying for the moon.

Notes and Comments

The Architecture Club

The fourth annual general meeting of members of the club, at the Architectural Association last week, was chiefly remarkable for the lively and racy discussion on American architecture, which followed the preliminaries of supper and business. Professor Reilly, down to introduce the subject, was, unfortunately, not well enough to attend; but the opening lost nothing by Mr. Yerbury's deputising, although the popular Secretary of the A.A. probably took his own—a very interesting and provocative—line. Sir Charles Allom, Mr. W. L. Wood, Mr. Stanley Hamp, Mr. W. Harding Thompson, Mr. Trystan Edwards, Mr. Charles Marriott, Mr. Oswald P. Milne, and Mr. J. C. Squire (the President) took part, and Mr. Charles Spooner put in a word now and then. The informality of the affair added much to the enjoyment, but we regret that it also prevents us from giving a more detailed account. Among others present were Mr. Darcy Braddell, Professor Wagstaff, Mr. H. B. Walters, Mr. Ewart Culpin, Mr. Ian MacAlister, Mr. H. J. Ward, Mr. Nathaniel Lloyd, Mr. Dunbar Smith, Mr. and Mrs. Harold Stabler, Mr. Christopher Hussey, and Mr. Percy Bentham. The formal business of general interest was the election of two members to the Executive Committee in place of those retiring under the rules, Mr. Nathaniel Lloyd being re-elected and Mr. A. S. le Maitre succeeding Mr. James Bone, who had decided to retire after much excellent service since the club started.

Progress at St. Paul's

At a meeting of the Representative Committee for the Preservation of St. Paul's Cathedral on Monday last, the fourth report of the Works Sub-Committee, dealing with the reparation work of the last nine months, was considered. The report confirms the experts' opinion as to the efficacy of the grouting scheme in consolidating and strengthening the main piers, and the work has so far advanced above the main floor that it has been possible to commence similar remedial measures on the portions of the piers in the crypt. The seventh complete series of levelling observations from the datum in the General Post Office Courtyard to all the plugs embedded in the masonry of the Cathedral, from the Crypt to the Whispering Gallery, has just been concluded, and the result shows no evidence of settlement in the foundations, nor vertical movement in other portions of the dome structure. The technical experts are able to state, as a result of the works so far carried out, that they found the condition of the structure quite as good as they had expected. They were able also to produce samples of the work which they had carried out, showing how perfectly the cementation work fulfilled its object. They were well satisfied from the experience gained since the work was first commenced that there was no foundation for the alarming statements which had been made during the past few months. This is cheering news, not merely as a record of patient but of effectual endeavour in the task of upholding London's great Cathedral. One may hope now that alarmist rumours will cease, and that the architects and engineers may be allowed to proceed quietly with their work. When the piers have been thoroughly repaired, the task of strengthening the dome structure at the platform level above the great arches, and

devising means for a better distribution of the weight of the dome at this point, will begin. It is here where the most serious failure has occurred, but much has been learnt, and the excellent model which has been made of the dome structure is said to have been very helpful in the examination of the problem and in suggesting possible means of dealing with it.

A Despised Fountain

Some official reply or explanation seems to be demanded by the letter which Lord Gerald Wellesley addressed to *The Times* last week concerning a marble and granite fountain which stood opposite the main entrance to the Zoological Gardens in Regents Park and which, according to his statement, has been hacked to pieces and carted away as so much rubbish. The gift of the philanthropic Baroness Burdett Coutts, it was erected in 1871, and though in the Gothic style, not very much favoured in these days, it deserved rather more consideration than to be thus ignominiously scrapped to provide parking space for two additional cars. Whether its room was preferable to its company may be a question of opinion, but if the gifts of the benevolent are to be smashed up without notice or agreement, there is no certainty that London may not wake up some morning to find that a really cherished art possession has not merely been removed, but destroyed.

The Thames Bridge Question

How difficult it is to devise needed improvement that will not interfere or affect some cherished institution or amenity may be gauged from a letter of Mr. F. I. Pitman, the famous oarsman, to *The Times*. In the general desire to secure additional bridges over the Thames to relieve traffic congestion, the effect of which the selected positions may have on the river traffic is apt to be overlooked. The Royal Commission on Cross-River Traffic recommended two new bridges in West London, one between Putney and Hammersmith and a second between Hammersmith and Barnes. Both will affect the historic University boatrace course, and therefore the course which is used for many other boat races and sculling contests. Mr. Pitman pleads very temperately for consideration of this fact in the design of the new bridges, and asks that a central arch shall be provided in each wide enough to enable two eights to race abreast, and so placed that the tide passes through the middle of the arch and neither boat is driven out of its course. The necessities of the river traffic were very strongly urged before the Royal Commission, and we doubt not that the needs of an event which holds a foremost place in the affections of a sport-loving nation will receive as much, or more, attention even than those of commercial traffic. Incidentally, the suggested line for the new bridge at Chiswick appears to be the most criticised of all the recommendations of the Royal Commission. This would cut through the middle of the famous Chiswick Mall, close to the old church, and destroy most of the amenities of a quiet and old world district. We are by no means convinced that this is the best or the inevitable course; but it is perhaps, too early to criticise details of a Report which has commended itself to all those who earnestly desire a broad and ordered plan of development for the Metropolis.

THE MONASTERY, RILA.

ARCHITECTURE IN BULGARIA

By C. A. MACARTNEY.

The Balkans are famous, as a rule, for anything but their architectural beauties, and certainly a country which Gothic never reached, and which missed the entire Renaissance and post-Renaissance movement up to the middle of the last century, cannot attract the eye which is in search only of familiar beauties. Nevertheless, Bulgarian architecture, both domestic and monastic—there are no other types worthy of mention—can show a great deal that is interesting and much that is very picturesque.

The early specimens which have survived are, with one exception, exclusively ecclesiastical. The ancient castles of the old Bulgarian nobles, built at a time before the Turkish invasion, when the country had developed a fully-fledged feudal system and bade fair to grow into a State on normal Western lines, have all been destroyed, 'mostly' by war, some, in the old capital city, Trnovo, by earthquake as recently as 1911, except only the Hreljo Tower, which now forms part of the monastery buildings of Rila. It is a gaunt, eminently uncomfortable building, of which only the top storey was used for living purposes, the rest consisting of a block of

rough masonry 30 feet high, its practical outline broken only by tall, narrow, blind arches. It probably represents the true Bulgarian style, whereas the early churches, even the first, show unmistakable signs of foreign influence.

Specimens of these early churches, more or less ruined, are to be found throughout Bulgaria and Macedonia. In particular, two colonies survive, each with a great number of churches clustered together in a very confined area. One of these is at Trnovo, on the north slopes of the Balkans, the other at Mesembria, on the Black Sea, an extremely ancient Greek settlement which for some centuries served as a sort of ecclesiastical Botany Bay for the Byzantine Empire. It is here that the early styles can best be studied, since Trnovo is now little better than a heap of ruins.

Three periods can be distinguished with sufficient clearness. The first owes its peculiarities to the Armenians, large colonies of whom were settled in Southern Bulgaria by the later Byzantine Emperors as frontier guards. The Armenians themselves mostly belonged to the curious Bogumil sect, which repudiated churches,

DETAIL OF CUPOLA.

EARLY CHURCH, MESEMVRIA.

with all other matter, as works of the Devil, drawing the logical conclusion that the greater the church, the greater its power for evil, the two homes of the Evil One himself being, firstly, the Temple at Jerusalem; and afterwards the Church of Saint Sophia at Constantinople. Their architectural ideas, however, seem to have impressed the Bulgarians, whose spiritual leaders they were in almost all respects. The churches of the first period, extending up to the twelfth century, follow the contemporary type usual in Asia Minor. They are long, low basilicas, often of considerable size, usually with three naves, separated from one another by two storeys of arcades, based on low, massive pillars which give an impression akin to that made by Saxon work. There are usually three apses, separated from the naves by square or rectangular spaces, cylindrical vaulting, and no cupola. There is no transept. The material used is plain, red brick, and there is hardly any internal ornament. Many of these churches have been preserved in comparatively good condition at Mesemvria, Ochrida and Sofia, thanks largely to the extremely enduring character of the brick of which they are composed.

In the second period, which lasted from the twelfth to the fourteenth century, Byzantine influence has come into its own. The churches are smaller, but taller. A cupola is now the rule, often surmounting a tall drum. The side naves disappear, or dwindle to narrow passages, so that the orthodox form of the Greek Cross is obtained. The lines are broken up by the cupola and transept, and the whole effect of the building lightened. The massive columns vanish from the interior of the naves, which are decorated with frescoes and ornaments. The monotonous exterior is varied by the introduction between the bricks of alternate courses of white stone, or of incrustations formed by pieces of sandstone enamelled in different colours and arranged in geometrical forms, giving the aspect of a mosaic. The outline is broken by windows, niches and blind arcades, often several storeys high. The whole, although on a small scale, speaks unmistakably of the pomp and bizarre luxury of the late Byzantine Empire, tempered by certain concessions to the less urbane atmosphere of the Balkans.

In the fourteenth century, the type of architecture which had become regular on the great monastic mountain of Athos reached Bulgaria, although it only became the dominant form there two centuries later. After that time, however, thanks to the extraordinary conservatism of the Orthodox Church, the type became completely standardised, and there are only small

variations of style between any Bulgarian church of the sixteenth century and almost any church of to-day. The Turkish invasion did much to arrest development, practically confining building, other than domestic, to the monasteries. The monasteries which existed, and exist to-day by the hundred in every remote and picturesque mountain valley of the Balkans and the Rhodope were seldom molested by the Turks, and, not being built in the centre of a Moslem population or in the vicinity of a Moslem place of worship, were neither subjected to the restrictions regarding height, ornaments, etc., imposed on the parish churches, nor were liable at any moment to be razed to the ground by a fanatical mob.

The churches of these rich monasteries are of great size, in order to afford room for flocks of pilgrims. The transept is enlarged by means of lateral apses, and a wide space is left in front of the reredos for the pilgrims to congregate. The internal decoration is exceedingly magnificent; the walls are often entirely covered with paintings in a primitive and extraordinarily conventional Byzantine style, reminiscent in its colouring of Cimabue, in its drawing and conception of the nature of Hell and Heaven of the primitive North German school, with a general effect which is, however, not unpleasing. It is interesting to notice how both the painting and the architecture quite eschew any pretension to individuality, remaining content, true to the Orthodox ideology, with the perpetuation of conventional types. The reredos, pulpits and stalls of the churches are lavishly painted, often smothered under gold paint, the whole effect being dazzling.

The general plan of the monasteries in which these churches are situated is nearly always the same. The

THE MONASTERY, RILA.

church occupies the centre of an irregular quadrangle, the sides of which are composed of the living-rooms. The windows of the latter look outward, while along the whole of the inside runs a broad gallery, separated from the court by a balustrade, often finely carved. The larger monasteries have several storeys, and the slender columns which support the arcades are most beautiful. The rooms are arranged on a very simple plan, the furniture usually consisting only of a settee running round their three sides and covered with native rugs or cushions, with an ikon or two on the walls. On the other hand, the ornamental woodwork of the balustrades, staircases and ceilings is elaborate and often artistic, although conventional in design.

Domestic architecture in Bulgaria lacks the historical charm of monastic. Taught, it appears by long experience of destruction, the Bulgar usually prefers to build his house of the least durable materials that will keep out the weather. It is only in the heart of the Rhodope mountains, where the inhabitants are noted stone-masons by trade, that stone is used to any large extent. Elsewhere, the peasant cottages are constructed of a wooden frame, the space between the beams (which are left to project) being filled with rough, sun-dried bricks, or even with hurdles daubed over with clay. The construction is so primitive that such a cottage generally falls to pieces after thirty or forty years, unless (as is very frequently the case) it is first destroyed by fire. A cottage of fifty years of age is an antique in Bulgaria, and it bears out the description, both by its ramshackle appearance and its pleasing air of old times. Seen in England, it

OLD HOUSES, PHILIPPOLIS.

would probably be adjudged to the early Tudor period. It may, indeed, be doubted whether the style of Bulgarian architecture changed in any one important particular between the years 1400 and 1900. It is a thousand pities that in the frenzy of rebuilding now rampant these beautiful old houses are now being pulled down wholesale, to be replaced by devastating imitations of nineteenth-century Munich and Vienna styles. For the old houses, if they were unsafe and insanitary past description, were—or, rather, are—an artist's dream. The lower storey is often built of rough, unmortared stones, is open on the side turned away from the street, and is used for a stable, a larder, a wine-cellar, a fowl-house, or all four at once. The living-rooms are on the first floor. Larger than the ground floor, they project out over the street, and this, combined with their half-timbered construction, makes them look curiously like very old English or French houses.

A spacious stairway leads up to the living-rooms, emerging on to a generous landing, which runs the whole length of the house, and is usually entirely bare except for an ikon and a portrait of King Boris or of Todor Alexandrov, the Macedonian leader. The living-rooms open off the hall, and are small and bare. Their plan is exactly similar to that of Turkish houses, except that they are provided with good chimneys instead of having to depend for heating on comfortless charcoal braziers. The windows often have lattices of wooden slats in lieu of glass, and are set well forward, so that the women of the house, who still go little out of doors, can get a good view of what is going on in the street.

In the north of Bulgaria a different style of architecture prevails, approximating to that usual in Roumania, and very much less picturesque than the Southern Bulgarian type. The houses are plain, single-storeyed erections, whose only claim to beauty lies in the little verandahs, with their slender columns of acacia-wood, which face even the poorest hovel. The Danubian plain, however, has few beauties of any sort to tempt the tourist—fewer even than the appalling modern “westernised” Sofia. But whoever likes to brave rather simple conditions and to spend a few weeks in Philippopolis, the half-Turkish villages of the surrounding plain, the slopes of the Balkan, Rila and Rhodope mountains, and the ancient Greek cities of the Black Sea, will never regret it.

THE MONASTERY, RILA.

Correspondence

Competitions—A Protest

To the Editor of THE ARCHITECT AND BUILDING NEWS.
Manchester College of Technology.

SIR,—I shall be glad if you can find room in the next issue of your journal for the insertion of the enclosed letters herein, sent (a) to the Town Clerk of Manchester, (b) to the President and Council of the Royal Institute of British Architects, and (c) to the Secretary of the Manchester Society of Architects.

Yours faithfully,

ALFRED W. S. CROSS

(We give below copies of the letters referred to)

To the Town Clerk, Town Hall, Manchester.

DEAR SIR,—My attention has been called to the fact that, under the head of "Competition Notes," a memorandum appeared in the issue of THE ARCHITECT AND BUILDING NEWS of the 4th instant, to the effect that the Manchester Corporation have accepted three nominations, made by the President of the R.I.B.A., for the appointment of Assessors to act in the proposed competition for the extension of the Manchester College of Technology.

As the architect of the existing building, I strongly protest against the Corporation's action in thus promoting a competition, without good and sufficient reasons, for the extension or completion of the work of a living architect.

The great slur cast upon the personal character or professional reputation of the victim of a policy which I venture to say is, in this instance, both unjust and unmerited, must be apparent to all concerned.

I challenge the promoters of the competition in question to bring forward any good and sufficient reason for a course of action, happily rare in this country, which, humanly speaking, can only have a very disastrous result upon my professional welfare. The work involved in designing and supervising the erection of the College of Technology at Manchester occupied some of the best working years of my life, and I do not hesitate to say that the building is both well planned and well constructed.

For your information I enclose a copy of a letter of protest I am sending to the President and Council of the Royal Institute of British Architects respecting their action in the matter.

Yours faithfully,

(Signed) A. W. S. CROSS,

Fellow and former Vice-President of the R.I.B.A.

P.S.—In order to make my position clear to the President and Council, I am sending a copy of this letter to the R.I.B.A.

To the President and Council,

Royal Institute of British Architects,

GENTLEMEN,—For your information I enclose a copy of the letter I have sent to the Town Clerk of Manchester respecting the proposed competition for this building.

As I strongly object to the principle of promoting competitions for the alteration or completion of buildings designed by living architects who are still in practice, I hereby resign my membership of the R.I.B.A.

I am, Gentlemen, yours faithfully,

(Signed) A. W. S. CROSS.

To the Secretary, Manchester Society of Architects.

DEAR SIR,—For the information of your Society I am sending you copies of my letters herein to the Town Clerk of Manchester and to the President and Council of the R.I.B.A.

Yours faithfully,

ALFRED W. S. CROSS.

The Brain Worker and Privilege

To the Editor of THE ARCHITECT & BUILDING NEWS.

SIR,—The reference in your issue of February 18 to a speech made by Dr. Cloudesley Brereton, of the British Confederation of Arts, raises important issues.

The workers in the arts are not so much claiming a privilege as expressing a point of view, that their moral and material requirements ought not to be completely ignored. The need for this expression has been demonstrated, and has found its medium through the various organisations representing the arts. The establishment of a confederation of the related societies is a logical sequel which finds its counterpart in many other phases of human activity.

The architectural profession has rightly organised itself in order that the reasonable claims of its members may be mutually understood and followed. Without that degree of organisation there would be not only a danger, but almost a certainty, of these reasonable requirements either being unequally applied or completely thwarted. The draft Parliamentary Bill for the registration of architects is a further step in the direction indicated.

Architects and other workers in the arts and kindred professions desire to, and do, loyally serve the community, but the community will not be served by allowing the elementary rights of such workers to go by default.—Yours faithfully,

M. E. MANSEL,

Hon. Secretary.

(British Confederation of Arts.)

Competition Notes

Competition Result

Schemes submitted for the erection of a large commercial building on the site which Mr. William Whitehead recently acquired from the Corporation in Deansgate, Knowsley Street, and Corporation Street have been adjudicated upon by Mr. Isaac Taylor F.R.I.B.A., architect, of Manchester, who has awarded the first premium of £100 for the design submitted by Messrs. J. C. Prestwich & Sons, architects, of Leigh. The design shows a four-storey building, to cost about £40,020.

Beckenham Municipal Offices

In connection with the erection of new municipal offices, the U.D.C. Works Committee propose to appoint Mr. H. Austen Hall, F.R.I.B.A., as assessor for the competition for designs.

Scottish National Memorial

Agreement has been reached between the Office of Works, the Ancient Monuments Board, and the Committee of the Scottish National War Memorial as to the design for the finish of the gable of the shrine of the memorial at Edinburgh Castle. In their report to the First Commissioner of Works, the Ancient Monuments Board say: "This design is, in our opinion, free from all the objections we ventured to express in regard to the former design, and we recommend that it should be adopted, subject to any minor modifications the architect and your Department may consider necessary."

Venetian College of Architecture

The special courses in architecture which were held at the Royal Academy of Fine Arts in Venice have been closed, and in their stead an independent College of Architecture has been set up. The Palazzo Giustiniani and certain neighbouring buildings have been assigned to the college in perpetuity by the Commune of Venice. The full course lasts five years, at the end of which a degree in architecture is awarded.

LIDENGEN HOUSING SCHEME: THE CHILDREN'S PLAYGROUND.

A SWEDISH HOUSING SCHEME

A model housing scheme has been carried out at Lidengen, on the outskirts of Stockholm, as a result of an enterprise on the part of a Swedish society known as "Bygge och Bo" (Buildings and Homes). This society offers yet another example of present-day Sweden's persistent demand for art and culture in everyday affairs, and was formed in 1921 with the avowed object of improving the standard of design in the home, not only in the actual planning and building, but also in equipment and decoration. One of its first activities was to organise a course of lectures for builders and others concerned with the practical side of house building and house furnishing, which attracted 180 builders from all parts of Sweden. Concurrently with the formation of this lecture course, an exhibition was opened of all things appertaining to the home, with such success that the "Bygge och Bo" exhibition is now a popular annual event in Stockholm to which everyone goes, not only to see the latest developments in kitchen arrangement and equipment, but also with the satisfaction of knowing that they will see an impressive array of beautifully designed household necessities such as glass, fabrics, furniture, and china. With its ever-growing popularity, "Bygge och Bo" was able last year to embark on the courageous adventure of founding a small community of model houses, grouped according to modern ideas in town-planning, in which the society's ideas of the house beautiful could be embodied. A site at Lidengen was acquired, and a competition organised for designs for its development and lay-out. Eighty-one designs were submitted, and the two judges, Professor Ostberg and Carl Bergsten, made their award to Sven Markelius, one of the younger of Sweden's many brilliant

architects. Sven Markelius' lay-out, as illustrated, represents the plan of Lidengen as it is to-day. It takes the form of what is usually known in the English garden suburb as a "Close," and here provision is made for a children's playground with a fountain. Six architects were invited to submit designs for houses which were to be erected on the various sites. They were to be of a type suitable for tenants of a moderate income, and to contain three, four or five rooms and a kitchen. Several designs were selected and executed, and some of them, on completion, were furnished and equipped throughout under the direction of a committee whose guiding motive was the combination of utility and good taste, and when the whole scheme, with the furnished houses, was thrown open as a public exhibition last year it met with a well-merited appreciation. The houses were offered for sale at the end of the exhibition, and provision for the future was made on lines similar to that of the English Public Utility Society. The houses, of which we illustrate a selection, are built of timber and rendered in stucco, a method of construction now much in use in Sweden. The stucco is usually coloured, pale

tints being favoured, either blue, green, pink, grey, yellow, or brown. Sometimes two or more colours are combined in the same building, and the effect is most refreshing, especially against a background of typical Swedish landscape of pines and rock.

The houses illustrated may be said to typify much of the work that is being done in Sweden at the present time, although in some of them, as is inevitably the case where an attempt is being made to produce something which is to be regarded as *le dernier cri* in good taste and refinement, there is evidence of a sophisticated attempt to manufacture simplicity.

THE TWENTIETH CENTURY HOUSE

IX.—Sunlight and Ventilation

By A. TRYSTAN EDWARDS.

My principal object in constructing the large graph which was published in *THE ARCHITECT AND BUILDING NEWS* of February 25 was to rescue architecture from the rigidity of building regulations by which some of the apostles of sunlight would bind this art hand and foot. By means of this graph it was established, for instance, that in streets approximately in the direction north and south, the building regulation ensuring sunlight in houses should be so framed as to relate the distance between the fronts of houses on opposite sides of a street and the distance between the backs of houses. When one of these two distances is very considerable we may with propriety decrease the other; while in streets approximately in the direction east and west it was proved that here such a policy of "give and take" was not desirable, but, on the other hand, these streets were the sunniest of all, and provided that a certain minimum width be insisted upon, they are eminently healthy, even if built in continuous formation.

It is a question, of course, of arranging the internal planning so that the living-rooms obtain the maximum of sun. Everybody would agree that on the least sunny side of the house we may place the windows of stairs, passages, the minor domestic offices such as bathrooms and closets, scullery, larder, and even a kitchen, which is often considered all the better for a north light. And, needless to say, a garage, an apartment now often planned as an integral part of the house, may also with propriety be given a north aspect. Nor is there anything original in the statement that for rooms in which the principal activity takes place in the morning, such as bedrooms, breakfast rooms and kitchen, an east aspect is pleasant, while a drawing-room, generally most used in the

afternoon, is all the better for a west aspect. While, of course, rooms facing south in a detached house have the maximum of sun, and, in so far as sunlight purifies the air in a room, these should be the healthiest.

Before giving an actual example of a detached house planned to give the maximum of sunlight and ventilation, I may refer to some most valuable researches on this very subject, which were contributed by Mr. Nathaniel Lloyd and published in the *Journal of the Royal Institute of British Architects* for September, 1924. He there makes an exhaustive study, not only of the factor of sunlight in relation to the detached house, but into the factors of rain and wind, and he combats the generally accepted notion that the south aspect is the best for a house. He points out that as in most parts of England the prevailing wind is south-west, a south-east aspect is better than a south aspect. Also for *prospect* a view towards the north has great attractions because it enables us to see the objects of Nature illumined by the sun, and not in shadow, as is the case when we look at them from the south. In stating this important fact, Mr. Nathaniel Lloyd reminds us that the placing of windows and of the rooms behind them must not be *entirely* determined by considerations of hygiene.

The advantages of a detached house are, of course, that all four sides can be used for windows, but this advantage can only be fully utilised in fairly large houses. In detached cottages one frequently finds that a whole façade is "blind," because if all the walls were punctured with windows the little rooms, being over-ventilated, would become draughty, and, moreover, an insufficient amount of wall space would be left for doors, fireplaces and furniture. A good

Fig. 32.

Fig. 33.

Fig. 34.

planner should be able to give to a cottage quite sufficient light and ventilation by placing his windows on *two* outside walls alone. This is as much as to say that cottages may quite suitably be built in groups in continuous formation. It need not be disputed, however, that for a house of the dimensions shown in Figs. 31-36, its complete detachment has simplified the task of planning for hygiene. Even here, however, I have made the north elevation entirely devoid of windows, except those placed in the recess, while it might be argued that the dining-room and drawing-room, and bedrooms Nos. 1 and 4, could quite reasonably have been given less window space than they now have. But certain advantages possessed by the plan may be pointed out.

1. On the ground floor there is a passage right through so that by opening the front door and garden door a current of air will ventilate the house.

2. On the first floor the main corridor is at each end, thus not only has through ventilation, but is joined by two short passages which supply cross ventilation between the water-closets and the rest of the house. It will be observed that similar cross ventilation is supplied in the case of the servants' closet on the ground floor. This should be considered extremely important, for no house can be altogether sweet and clean unless this device of planning be adopted. And such cross ventilation has *not* adequately been achieved if access to the water-closet is direct from a main corridor of which the only window may be a considerable distance away. A very small proportion of plans of houses and flats are altogether satisfactory in this respect.

3. Besides windows on the south side, the dining-room and drawing-room have east and west windows respectively, while all the bedrooms have south, west or east aspects. In every room there is the maximum of cross ventilation between the door and the windows.

4. It is assumed that heating and cooking is by electricity, but in the event of coal being used the plan

can be adapted without alteration, as a coal-house is placed near the back door.

5. A staircase leads to a flat roof, which, however, has high parapets at certain points where seats could be provided screened from the wind, or where, alternatively, shelters could be erected suitable for sleeping in the open or for summer-houses.

6. The plan without alteration can be turned round to have any one of the four elevations facing the road. For instance, if the house is on the south side of a road going due east and west, its north elevation faces the road as shown in Fig. 34, and could actually be adjacent to the pavement, leaving the maximum of garden space behind. In such a case the plan is perhaps used to its best advantage; for secondary access is obtained most economically; no back road is necessary, for the back door, screened from the entrance portico, is approached direct from the main roads. Moreover, the outflow of all the pipes in the recess can be conducted immediately to the public sewer. It may be assumed, of course, that the flat roof will be sloped so as to conduct the rain water to the recess. A house so arranged will also have the advantage of turning all the principal rooms *away* from the noise of traffic. If the house is on the *north* side of a road going east and west, the elevation which lights the staircase, hall and dining-room and drawing-room becomes the front, and that with the recess (the design of which could be suitably modified) would become the back. If the house were on a road going north and south, the elevation containing the recess could still be north, and one or other of the elevations shown in Figs. 32 and 33 could face the road.

Whatever criticisms may be directed against the elevations, all four of them are at least to a certain extent decorous and are fitted to be seen either from the windows of neighbouring houses or from the public thoroughfare. This result could certainly not have been obtained unless there had first been developed that device of planning and elevational treatment which I have christened the "Recess."

ASSEMBLY BUILDING OF THE FORD MOTOR COMPANY, ST. PAUL, MINNESOTA. ALBERT KAHN, Inc., Architects.

“THE FACTORIES OF HENRY FORD”

By HOWARD ROBERTSON, F.R.I.B.A., S.A.D.G.

At a recent meeting on the subject of modern American architecture, one of the speakers called attention to the fact that, whatever might be felt with regards to American cities “vertically,” *i.e.*, from the elevational point of view, there was no doubt at all that “horizontally” there was a good deal to be said for American powers of arrangement.

In this remark lies an understanding of American architectural capacities and limitations, which consist, on the one hand, of talent for organisation of plan, the logical working out of the conception in all its practical details, and, on the other, of too ready a yielding to the dictates of a chosen style, the failure to reproduce in elevation the same clean directness which appears in the composition of the plan.

America is one of the few countries where buildings of the purely commercial type can be said to be contributing the most interesting and vital examples of its modern architecture. Germany, perhaps, can claim a like distinction, and France is tending in the same direction; but as a rule commercial architecture is too pre-occupied with meeting material requirements to concern itself with problems of expression.

At the present moment a greater amount of attention is being concentrated in America on commercial structures than on any other type, and the architects of these buildings, in a country where competition is so keen, must of necessity be highly competent in planning and organisation. That these men are also becoming very successful in elevational expression is due to the fact that they are willing to allow the essentials of geometrical form to dominate their elevations, and have been content to leave the building masses almost unadorned. It is a case where, in a sense, one feels that successful treatment is mainly due to the fact that too much has not been attempted. This may appear as a rather negative virtue, but, on the other hand, it must be recognised that successful simplicity demands a certain “rightness” in the main elements, and in much of the American com-

mercial work there is evident competence in this respect.

There is perhaps no type of commercial structure which can provide a finer opportunity for a display of the virtues of organisation in plan and direct expression in elevation than the modern factory, and there has probably never been a better illustration of the demands of industry on architecture than that provided on a huge scale by the Ford Industries in Detroit.

It is difficult to say to what extent Henry Ford is appreciative of the purely architectonic aspect of his marvellous factories, but of one thing there is no doubt, and that is his passion for organisation in layout as well as in production. His great plants are marvels of broad simplicity in the disposition of the buildings, and in that sort of ordered efficiency which attains to something much finer than mere neatness. There is an impressiveness in the marshalling of great buildings, hundreds of feet in length, along concrete avenues which are wider than the streets of a great city, and which are swept and immaculate like the deck of a battleship. The works of Ford resemble on a huge scale the ideal business desk of some great magnate, a polished expanse untroubled by straggling papers or disorder, and yet contrived for the maximum of efficiency and daily output. There is no sense of the atmosphere of flurry or crowded complication which one associates with a great mechanical production, but instead the complete realisation of a huge and docile machinery so ordered that it functions more through the guidance of the human brain than by the action of physical labour. There is a vivid impression of energy immensely powerful and completely in control. The passion of Henry Ford for clean efficiency finds its fullest expression in what is probably the most astonishing factory building in the world, the Engineering Laboratory at Dearborn, near Detroit, the work of Albert Kahn, architect of the most architecturally important of Ford's buildings, and a man who in his own field occupies

Michigan a similar position to that of his great client in the automobile industry.

The office of Albert Kahn is one of those great architectural organisations which are "plan factories" in the best sense of being well equipped and systematically organised, and which exist nowhere in the world on the scale found in three or four of the big cities of the United States. Such offices may employ as many as 350 employees—draughtsmen, engineers, specialists, designers, "followers-up," job-captains—and they have their own despatch departments, waiting rooms, libraries, plan vaults, secretarial and accounting offices, the organisation *in petto* of any considerable commercial institution. But what, in Kahn's office, is more remarkable than size is the quality of work turned out, the obvious influence over so many plans and details of the directing brain of Albert Kahn, the stamp of whose personality is clearly evident in innumerable buildings of widely varying type.

It is interesting to realise the architectural status of Albert Kahn in examining the Dearborn Laboratory, for this building shows not only competence and those practical qualities which would naturally be expected in factories for Ford, but in addition is handled both in mass and detail with a freshness of conception and a selective taste which reveals unusual imagination and personality on the part of the designer.

The Laboratory stretches a full 800 feet along a broad grass-bound avenue, and spreads 200 feet in depth; the front is faced in Bedford limestone and the roof is of Italian tiles, red, green and yellow, laid in mixed colours and with random horizontal joints.

The plan shows the arrangement of the interior, which consists of a small central block of offices, including a library and the private rooms of the Fords, and a vast working space with columns spaced on a grid of 50' longitudinal and 40' transversal. Each span is lit by a continuous double monitor light, the

[Photo: Tnos. Eluson.]

ASSEMBLY BUILDING, FORD MOTOR COMPANY, ST. PAUL: DETAIL OF FRONT. ALBERT KAHN, Inc., Architects.

glazing of which can be screened by electrically operated blinds. Between these spans, longitudinally, run broad gutters, and surrounding the supporting piers are the ducts and service pipes. The effect of the interior is one of well lit and ordered brightness, an impression enhanced by the spectacle, somewhat unusual in a laboratory, of a wax-polished maple floor over the whole area, on which stand the machinery and the operators, each machine being surrounded by a rubber mat or gangway.

The detail of the exterior reveals a blend of modernism with the classic spirit, and has a flavour of germanic power touched by that refinement which is a heritage of the best work of firms like McKim, Mead & White. Over the entrance doorway, flanked by well-carved figures, stands a block with an inscription. It would be unkind to Ford to suggest that its wording is to be taken as a challenge to the building which supports it: "Mankind passes from the old to the new on a human bridge formed by those who labor in the three principal arts—Agriculture—Manufacture—Transportation."

The Dearborn Laboratory is the architectural gem of the Ford Industries plant, but equally interesting in a different way is the Ford air station hangar.

The remarkable feature of this building is the system of the cantilevered roof trusses, the object of which is to permit the sides of the hangar to be thrown completely open without posts or obstruction of any kind, a result which can be accomplished by a system of internal tracks, rounding the corners behind the pylons, and on which slide the electrically operated doors. It is a system of sliding doors on a big scale, the special feature being the rails curved at the corners and on which the doors, when open, are "parked" in a compact group. The building is 300 ft. in length, so it can be realised that the problem of an unobstructed continuous opening was not an easy one for the architect to solve.

[Photo: F. R. Yerbury.]

FORD INDUSTRIES: THE POWER HOUSE AT THE RIVER RONCE PLANT.

The exterior of this building is clean and straightforward in design, pleasing in proportions, and arising directly from its functional requirements.

Modelled on very similar lines to the Dearborn Laboratory is the Assembly Building of the Ford Motor Company at St. Paul, Minnesota, a splendid example of what can be accomplished in the treatment of an industrial building to harmonise with fine surroundings, for this plant is situated on a main boulevard and overlooks the Mississippi River.

As in the case of Dearborn, the material used is stone throughout, ornamented with carved panels and fluted pilasters; the roof is of Spanish tile.

The structure consists of a one-storey steel frame, and covers an area of 1,400 ft. by 600 ft. The architects, in their handling of this long front, have avoided any feeling of monotony, and show a sensitive appreciation of the dignity of repetition.

While the smaller buildings of the Ford group are more distinctly expressive of their individual purpose, it is undoubtedly the great masses of factory building, workshops or power stations which make the most dramatic appeal to the eye, and which suggest a combination of mystery and power.

From the point of view of form analysis, it is the long horizontal lines of glazing, which are unbroken from end to end, and occasionally a tremendous accent of contrast, such as that of the four great chimneys in our photograph, which provide the dominant effects. But in looking at these buildings one forgets to analyse; face to face with this pulsing city of machinery, spreading its immense lengths in harmony with the flat country-side of Michigan, one feels only awe for the achievements of one man, and envy for the opportunity of another.

Professional Societies

Royal Institute of British Architects

An exhibition of mural paintings illustrating the history of Rochester, and executed by Professor Gerald Moira for the new Ford Almshouses at Rochester, which were designed by Mr. E. Guy Dawber, P.R.I.B.A., will be held in the Galleries of the Royal Institute of British Architects, 9 Conduit Street, W.1, on Thursday, March 17, and Friday, March 18, between 10 a.m. and 6 p.m. Admission free.

THE TITE PRIZE AND THE SOANE MEDALLION.—Attention is called to the fact that the preliminary "en loge" competitions for the Tite Prize and the Soane Medallion will be held on April 27 and 28 respectively, instead of April 7 and 8 as previously announced.

R.I.B.A. (HENRY JARVIS) STUDENTSHIP AT THE BRITISH SCHOOL AT ROME.—The regulations have been amended to the effect that the winner of the R.I.B.A. (Henry Jarvis) Studentship at the British School at Rome must be eligible to become a Student or Associate of the R.I.B.A.

The Garden Cities and Town Planning Association

The spring tour of the Association this year will be to the South of England. The cities to be visited are Bournemouth, Southampton, Portsmouth and Winchester. The tour has been arranged with the Corporations of the cities concerned, and representatives of those cities will accompany the party on each series of visits. The tour will thus afford, under most favourable conditions, an opportunity of seeing municipal development of varying character. Full particulars from the Secretary, The Garden Cities and Town Planning Association, 3 Gray's Inn Place, W.C.1.

Coming Events

The Royal Institution of Great Britain.—Friday, March 11.—Mr. George Macdonald, C.B., "The Wall of Hadrian." 21 Albemarle Street, W.1. 9 p.m.

The Association of Architects and Surveyors (Technical Assistants (Metropolitan Division)).—Friday, March 12.—Visit to County Hall, Westminster Bridge. 2 p.m.

Institution of Municipal and County Engineers.—Saturday, March 12.—Council Meeting.

The Royal Institute of British Architects.—Monday, March 14.—Mr. Howard Robertson, F.R.I.B.A., on "Modern French Architecture." 8 p.m. 9 Conduit Street, London, W.1.

Edinburgh Architectural Association.—Monday, March 14.—Annual General Meeting of Associate Section.

The Royal Society of Arts (Cantor Lecture).—Monday, March 14.—Mr. G. I. Finch on "Some Industrial Applications of Electrothermics." John Street, Adelphi, W.C.2. 8 p.m.

Royal Institute of British Architects (Lectures on Architecture for Workers in the Building Trade).—Tuesday, March 15.—Professor C. H. Reilly on "Liverpool Cathedral." 9, Conduit Street, London, W.1. 8 p.m.

The Institute of Arbitrators.—Tuesday, March 15.—Address by the President, Mr. H. B. Chaplin Baldwin, F.C.A. Captain W. T. Creswell, Barrister-at-Law, will open a discussion on "Arbitration in Disputes." 28, Bedford Square, W.C.1. 4.30 p.m.

The Institution of Civil Engineers (Students' Meeting).—Wednesday, March 16.—Mr. Frederick Cecil Jordan, B.Sc., on "Fire-Protection in Buildings, with Special Reference to Reinforced-Concrete Construction and Automatic Sprinklers." Great George Street, Westminster, S.W.1. 6.30 p.m.

Town Planning Institute.—Wednesday, March 16.—Alderman E. G. Culpin on "Decentralisation." 6 p.m. Caxton Hall, Westminster, S.W.1.

Edinburgh Architectural Association (Associate Section).—Wednesday, March 16.—President's Valedictory Address. 15, Rutland Square, Edinburgh. 8 p.m.

The Geffrye Museum.—Thursday, March 17.—Mr. Ingleson C. Goodison, L.R.I.B.A., on "English Furniture, period of William and Mary and Queen Ann." Kingsland Road, Shoreditch, E.2. 7.30 p.m.

The Royal Technical College Architectural Craftsmen's Society.—Friday, March 18.—Business Meeting. Mr. W. McCrae on "Architecture and Acoustics." 7.45 p.m. Glasgow.

Birmingham Architectural Association.—Friday, March 18.—Mr. W. H. D. Caple, F.R.I.B.A., on "The Annual Excursion to Laon."

The London Society.—Friday, March 18.—Mr. Montague Fordham, M.A., on "The Slums: Their Making and Unmaking." 18, John Street, Adelphi, W.C.2. 5 p.m.

The Yorkshire District (I.M.C.E.) and the Town Planning Institute (North of England Div.).—Friday, March 18.—Meeting at Manchester to discuss the Manchester Regional Report.

The London Society.—Saturday, March 19.—Visit to the Geffrye Almshouses, Kingsland Road, Shoreditch, E.2. 3 p.m.

Building Surveyors' Association.—Saturday, March 19.—General Quarterly Meeting. Cornmarket Hotel, 1 Old Ropery, Liverpool. 2.30 p.m.

Manchester Building Trades' Exhibition.—March 29-April 9.—Particulars from Provincial Exhibitions Ltd., City Hall, Manchester.

New Ways and Means

From The Ideal Home Exhibition, Olympia

A New Water Heater

A new water heater controlled by a thermostat and insulated like a thermos flask is exhibited at Stand No. 115 by Messrs. Home Appliances, Ltd., of 42 Newgate Street, London, E.C.1. This "Ever-Hot" Heater is made in three sizes, with tank capacities ranging from 13 gallons to 25 gallons, and heating surfaces of from 1,350 to 2,700 square inches. The smallest model, with an overall height of 55 inches, consumes from 45 to 68 cubic feet of gas per hour, the pilot light taking three-quarters of a cubic foot per hour for maintaining the temperature of the water in storage at 70° above room temperature. Starting hot, this model will deliver from 31 to 41 gallons of water within one hour at a temperature (at the tap) of 100° above that of the incoming cold water, and when hot water is drawn off the thermostat increases the gas supply until normal temperature conditions are restored. The tank can be heated by either ordinary town gas or by petrol gas, and the gas is thoroughly filtered before entering the thermostat in order to obviate stoppage of the pilot orifices. The thermostat is adjustable and screws directly into the boiler. The boiler itself is constructed of "copper-steel," heavily galvanised inside, and tested to 500 lb. per square inch pressure; the exterior is finished "satin silver." An exclusive feature is added in the shape of a "leakage by-pass" for preventing the loss of hot water through a leaky hot-water tap.

A New Petrol Gas Plant

A new electrically driven generator for "Silverlite" Petrol Gas, introduced by Messrs. Spencers (London), Ltd., of 6 London Street, Paddington, W.2, is in operation at Stand No. 97. This generator is entirely automatic in operation and is claimed to

New "Silverlite" Petrol Gas Unit.
(Spencers (London), Ltd.)
(Stand No. 97, Main Hall.)

produce a correctly proportioned mixture of non-explosive petrol air-gas in the exact quantity required, in that the plant "starts up" as soon as the gas is turned on and "shuts down" when the gas is turned out. Once installed, this generator requires no further attention than filling with petrol as occasion demands. It is designed and tested to work at its maximum rated gas output, and at this load the gas container will slowly rise and cut off the current operating the motor, whilst on falling it switches on again and "picks-up" before bottoming. A rubber air bag is fitted to this plant to equalise the intermittent discharge of the air compressor, the outlet from this bag to the carburettor being controlled by a cock which can be adjusted so that the gas container rises steadily without any tendency to "jump." Another feature worthy of mention is the circulator burner, which can be put into service when the temperature in the power house falls below 45° F., as a means of protection against frost. The small amount of heat produced by this burner will also replace the warmth extracted from the water in the carburettor tank by rapid vaporisation during heavy loads. This new unit is made in four sizes, giving a range of 300 to 1,000 cb. ft. of "Silverlite" petrol gas per hour, this gas being composed of 1½ per cent. of petrol vapour and 98½ per cent. of air.

A New Domestic Boiler

A new "Greyt-Heat" Open Fire Domestic Boiler, manufactured by Messrs. The K. C. B. Foundry Co., Ltd., of 120B Mount Street, London, W.1, is being shown at Stand No. 104. This boiler has been put on the market as an alternative to the original "Greyt-Heat" Boiler, which was of the closed type, fitted with a large mica window and a shaking bottom grate adapted for burning anthracite or broken coke. The new boiler is identi-

cal with this latter so far as its heating capacity is concerned, both being rated at 25,000 B.Th.U. per hour, which with a heating surface of 2½ square feet is capable of raising 25 gallons of water per hour from a temperature of 50° to 150° Fah. The new boiler is mounted on a baseplate with legs; with the fire doors open and the front fire bars dropped, as shown in our illustration, it gives an "open fire" of ample proportions. The polished hotplate, available for minor cooking purposes, measures 20½ in. x 16½ in.

A New Lighting Unit

The constant breakage of lighting glassware in large stores, due to insecure methods of fastening, has prompted Messrs. The General Electric Co., Ltd., of Magnet House, Kingsway, London, W.C.2, to introduce the safety canopy fitting, which we illustrate. In this device the glassware is carried from flexible steel suspension wires, which are attached to the supporting ring of the glass at two points and secured to a rotatable winding drum at the crown of the fitting. When it is desired to clean the glass it is merely necessary to rotate the wing nut at the top of this canopy fitting, for the rotating drum then automatically unwinds and lowers the globe. In this way the possibility of dropped glassware is almost entirely eliminated, as both hands are left free to carry out any adjustments or cleaning. It is also impossible to leave the globe insecurely fixed, for until the locking-nut is screwed up the globe will remain suspended. A special ring is provided for clamping the neck of the glassware, and no screws whatsoever touch the glass, so that unequal pressure is obviated. This ring is carried by two solid lugs, through which the suspension wires pass, and the latter are knotted on the under side and sweated to make it impossible for the ring to

The "Ever-Hot" Water Heater.
(Home Appliances, Ltd.)
(Stand No. 115, Main Hall.)

The "Greyt-Heat" Open-Fire Boiler.
(K. C. B. Foundry Co., Ltd.)
(Stand No. 104, Main Hall.)

become detached. The rotatable winding drum is fitted with an internal member which actually carries the suspension wires, all weight being taken by a central screwed member direct from the suspension hook. The gallery does not, therefore, carry any part of the glassware, and when the drum is revolved it merely draws up the suspension wires, bringing the glass with its supporting ring into position in the gallery. The wing nut is then screwed home and tightened to prevent the drum from reversing under the gravitative action of the globe. These "G.E.C." Patent Safety Canopy Fittings can be supplied in several sizes, the metalwork being in oxydised copper.

A New Stove with a New Finish

At Stand No. 123 Messrs. Smith & Wellstood, Ltd., of Bonnybridge, and of 11 Ludgate Circus, London, E.C.4, are showing a new addition to their series of "Esse" stoves for the continuous burning of coal, anthracite or

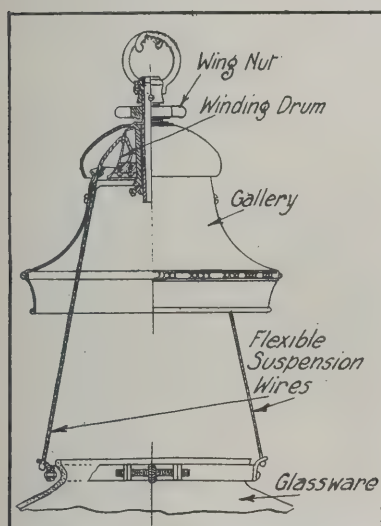

The "Esse-Vista" Stove.
(Smith & Wellstood, Ltd.)
(Stand No. 123, Main Hall.)

being supplied in a new "Armesse" finish which provides for a bright metallic surface of antique appearance which does not discolour. It can also be supplied in black vitreous enamel and in a variety of majolica enamels to harmonise with interior decoration.

A New Cooking Unit

A new "G" Pattern Triplex Grate with an oven on each side of the fire, designed to meet heavy cooking requirements, is being exhibited by Messrs. Triplex Foundry, Ltd., of Great Bridge, Staffs. This unit comprises two lower roasting ovens and two upper boiling ovens, a large hot-chamber extending the whole width of the grate, and two large grilling ovens, all worked from a 12-in. fire. In addition to this, the unit is fitted with a high pressure boiler of ample dimensions for maintaining a hot-water cylinder of 40 to 50 gallons capacity. The overall dimensions are 54 in. high by 60 in. wide, and this necessitates the provision of a brick opening 60 in. by 66 in. by 24 in. deep. The ovens and flues are built up of cast-iron plates in sections, and the flues are of the ascending type. In common with other "Triplex" grates, the front is ground smooth and stoved black enamel, in order to do away with the use of black lead, whilst

The "G.E.C." Patent Safety Canopy.
(The General Electric Co., Ltd.)
(Stand No. 86, Main Hall.)

coke. This new recruit, known as the "Esse-Vista," has several improvements on former designs, the upper sliding doors (in place of hinged doors) being an outstanding feature. As shown in our illustration, these doors are exceptionally wide, and slide quite out of sight when opened. The lower ashpit door need be opened only for the removal of the ashpan, as facilities are provided for shaking and clearing the bottom fire bars, assisting stones and clinker into the ashpan with the poker and controlling the air inlet, whilst this door remains closed. In addition to the front air inlet control, an effective damper of special design, adjustable in three positions by a lever handle on top of the stove, is fitted in the back flue outlet. The body of the stove has been designed to ensure a large proportionate emission of heat into the room, this being assisted by a baffle plate fitted behind and above the burning fuel, thus preventing the usual wastage of heat into the chimney. Openings in the side plates are also provided to distribute warmth from the internal stove body. This stove is made of cast-iron throughout, and is

the oven doors are tiled to be in keeping with the general decoration of the kitchen. The lower ovens are fitted with patent sliding shelves and four sets of runners, whilst each of the upper ovens has four loose boiling rings which are large enough to take saucepans of one gallon capacity. The fire front is of the basket type, and the smoke and hot gases given off from the top of the coals are drawn downwards through the incandescent body of the fire and consumed. A boiling stool, large enough to support a 2½-gallon oval cooking pot, can be fitted to the front of the fire, as shown in our illustration. This stool is of the boxed-in form, open only on one side, where it receives the heat direct from the fire and turns it to useful purpose. The high pressure boiler can be supplied in wrought iron or copper, to suit the local water supply. When the cooking or boiling dampers are open the hot flue gases pass under the boiler before reaching the oven, and this ensures the efficiency of the hot water service. A direct flue, however, is also fitted at the back of the boiler with a

The "G.E.C." Patent Safety Canopy.
(The General Electric Co., Ltd.)
(Stand No. 86, Main Hall.)

separate controlling damper, but this is only pressed into service when an extra quick supply of hot water is in demand for the bath.

A Substitute for Wall Tiling

Rolled opal glass in a variety of colours suitable for interior decoration, as a substitute for wall tiling in bathrooms and kitchens, has been placed on the market by Messrs. Jules Lang (Nitaline), Ltd., of Oil Mill Lane, King Street, Hammersmith. This glass, which is marketed under the name of "Nitaline," can be supplied in sheets of ¼-in. thickness, from 8 ft x 3 ft. downwards, bevelled or bull-nosed at the edges, if required, and drilled and shaped to specification. All the colours are permanent and extend throughout the thickness of the sheet; they cover a wide range, and include marbled and mottled effects, as well as plain black and white. The white opal is obtainable in various thicknesses from ⅛ in. to ½ in., the thinner sheets being used for ceilings, in which capacity they provide for a successful means of deflecting indirect artificial light.

Building News in Parliament

WESTMINSTER, Wednesday, March 9.

Although certain works of repair are now proceeding on the Houses of Parliament, as the casual observer can see, the substantial scheme for renovating the stonework which has suffered so greatly from the vagaries of the London climate has yet to receive the sanction of the Commons. This week it was announced by Captain Hacking, speaking on behalf of the Office of Works, that that sanction will be asked—presumably on an early date—when the Vote for "Houses of Parliament Buildings" is taken in Committee of Supply. Assuming the Vote is agreed to, it is proposed to commence work on the Terrace Front and the Central Tower.

The Army, as the Secretary for War stated this week when introducing the Army Estimates, is faced with a building problem quite as formidable as those which face some civilian authorities. An effort has been made this year to reduce the Estimates as far as possible, and this economy, it is said, will be rigorously applied to brick and mortar. Nevertheless, the War Office are promoting a cottage housing scheme at Salisbury Plain, the total cost of which is estimated at £195,000, and upon which £10,000 will be spent this year. At Didcot, £35,000 is being spent by the Department to complete housing accommodation for certain civilians who are connected with the Ordnance depot. The total expenditure which the War Office will incur this year in providing or improving married quarters for officers will be £110,000, and, in respect to married quarters for non-commissioned officers and men, £180,000.

The Commissioners of Crown Lands are determined that there shall be no disfigurement of the architecture of the new Regent Street by the display of signs on the face of the stonework indicating the position of showrooms and offices on the upper floors. This decision was declared in the Commons by Mr. Walter Guinness, the Minister of Agriculture, speaking on behalf of the Commissioners. The signs, he added, are required to be on the return faces of the stone piers inside the entrances, which is considered to be quite adequate for the purpose.

It was represented by Mr. Rye that the Commissioners' regulations lean so much to severity that difficulty is met in letting the upper parts of premises in Regent Street. Mr. Guinness, however, refused to accept this reflection, and contended that sufficient facilities are given for the occupants of the higher floors.

The question of the housing subsidy is likely to be debated before long. The Labour Party are not reconciled to the policy of the Minister of Health, which is the gradual reduction of the subsidy till it reaches vanishing point, and they are likely to seek an opportunity of raising the subject. Mr. Chamberlain stated this week, in reply to a question, that a certain number of local authorities have informed him that in their opinion there is no need to continue State assistance for the erection of houses in their districts by private enterprise.

The Home Secretary stated that the parties who are concerned in the use of lead paint in this country have now reached an agreement which will enable this paint to be used under the regulations framed by the Home Office. When an attack was made upon the Government on this question recently in the House of Lords by Lord Arnold, Lord Burnham, who was Chairman of the International Conference on Lead Paint, suggested that it was possible that the British Government may yet have to consider the policy of prohibition. But the use of lead paint under regulation has been adopted and embodied in an Act, and this policy will be tested before any new departure takes place.

A New Factory in Ferro-Concrete

Messrs. Wallis Gilbert & Partners, who have already proved so successful as factory designers, have in their newest work at Wembley given fresh proof of their skill. This building, designed for Messrs. Wrigley Products, Ltd., raises some highly interesting points with reference to factory design in general and to the architectural treatment of ferro-concrete in particular.

Let us first examine the long façade, which consists of several storeys of which practically the whole of the floor space is just a continuous glass screen from one end of the building to the other, the only elements of solid wallage being the broad concrete horizontal bands which separate one storey of windows from the next. It is true that at the lateral extremities of the façade there are broad piers which close in the series of windows and provide a satisfying finish to the composition, but apart from these the only vertical members which break up the long procession of panes of glass are very slender ones and do not appear to be performing any constructional function.

One of the most important elements in architectural design is that of scale, and one cannot help asking whether there has been achieved a community of scale between the two façades of this building, which are shown in the accompanying illustration. It is true that the windows on both sides share the same vertical dimension and are divided into panes of similar size. We are yet, however, left with perhaps insufficient means of comparing in our own minds the respective breadths of these façades, and without dogmatising in the matter one may suggest that had the windows on the longer façade been divided, not by concrete mullions, which might have suggested internal divisions, but by slightly thicker window bars, into sections comparable in dimension to the broader windows in the end elevation, a more intimate æsthetic relationship between the façades would perhaps have been achieved.

In many new ferro-concrete buildings, instead of emphasising the horizontal constructional members at the expense of the vertical, as is done in the present instance, we find that the vertical members are emphasised to the virtual obliteration of the horizontal ones, and we get those long window slits and emphatic "vertical emphasis" which appears to be characteristic of the architectural designs generally described as "modernist." It is claimed on behalf of these latter that they express ferro-concrete construction, but, of course, they do nothing of the kind, for in this method of construction the horizontal members are just as important as the vertical and cannot in reason be ignored, and especially not by those who solicit our praises on the ground that they are truthful constructors. As a matter of fact, the creators of this "vertical emphasis" do far worse than belie construction, for in minimising the importance of the horizontal members of the building they contrive to conceal the floor levels so that the essential facts of the building being divided into several storeys is not allowed to be expressed on the façades. Thus they succeed in falsifying not only the structure of the building, but its function as well. It is an agreeable feature, however, in this design by Messrs. Wallis Gilbert & Partners that the floor levels are clearly indicated on the façades, and so in this matter also it expresses what is far more important than truthfulness of construction, namely, truthfulness of character.

The contractors were Messrs. A. Roberts & Co., Ltd., while the reinforced concrete was designed by The Trussed Concrete Steel Co.

NEW FACTORY FOR MESSRS. WRIGLEY PRODUCTS, LTD., WEMBLEY.
WALLIS, GILBERT & PARTNERS, Architects.

BUILDING COSTS IN THE UNITED STATES

Mr. Harvey Corbett's paper was read at the Royal Institute on his behalf by Mr. T. S. Tait, and we give below some points from it.

It has become apparent during the last decade or two, that these ugly matters of material and labour, time-clocks and window-glass, hoisting winches and cement-mixers, are increasingly the proper pre-occupation of the architect.

All that is changed, with us as it is with you. To-day he finds that these mundane matters of cost per foot cube in pounds and pence, dollars and cents, must be part of his stock-in-trade if he is to survive. For that reason they are worth discussing, and because my own dealings have been largely with commercial structures I feel myself in some measure competent to discuss them.

On my visit to London last summer, my only business excuse was an enquiry into the rather problematical extensions to Bush House. At that time I went rather carefully into the matter of costs for that particular type of commercial building. Mr. T. S. Nunn, of Messrs. Burr, Son and Nunn, rendered me a great service by providing me with a complete list of labour costs figured on an hourly basis, and material costs figured on a unit price basis. Then, upon my return to New York, Messrs. Hegeman and Harris very kindly checked this list with their own lists, and supplied the figures for identical items in New York.

In this manner I secured a complete tabulation of building production costs in the two cities—a practical list, not a supposititious one based on theory or guesswork.

We find that labour in New York is paid at least four to five times as much per hour as in London, four being a conservative estimate. For instance, a bricklayer in London receives 1s. 9½d., and in New York 7s. 3d. A compressor driver gets 1s. 5½d. in London, and 8s. in New York. An ironworker 1s. 5½d. in London, and 7s. 3d. in New York. A plasterer 1s. 9½d. with you, and as much as 10s. with us.

With these figures in mind, you may well imagine my astonishment when I read further on in Mr. Nunn's report that the cost per foot cube of finished building (I am still referring to commercial buildings) was actually *no more* in New York than in London.

"While to-day's prices per foot cube for various buildings in London are approximately considerably less than they were in the boom years immediately following the war, they still show an increase of probably 120 per cent. over pre-war costs. A large modern office building of a substantial and efficient, but plain description, cannot be built for a figure less than 2s. 1d. per four cube. Examples are numerous at from 2s. 4d. to 2s. 9d. The larger and more ornate buildings for shipping companies, statutory authorities and other big concerns vary from 3s. 3d. to 5s. per foot cube, according to the nature of the work, the character of the external elevation treatment and the amount of decorative finish desired in the principal portions internally."

If I were asked to give four cube figures for these classes of buildings in New York, they would be practically the same in each case.

My task is, therefore, to explain how, with labour over four times as costly, we can build at the same final price for the finished structure.

There are four factors which go to make up the actual cost of a building: (1) Architects' and engineers' services; (2) contractor's organisation costs; (3) material; (4) labour to put the material in place.

The first item, architects' and engineers' services, is to all intents and purposes the same for New York

and London, namely, 6 per cent. of the cost of the building.

The second item, contractor's organisation costs, we may also assume to be about the same. Although in America we may have larger contracting organisations with greater overhead expenses, the volume of work done is proportionately greater, and hence the overhead charge against each individual job is proportionately less.

It is more difficult to determine whether the third item, material, becomes a natural increased cost in the completed building or not. However, I believe we are safe in assuming, all things considered, that material costs are about the same in the two cities.

Hence three out of four factors in the actual cost of building are seen to be about the same in London and New York. It, therefore, follows that the fourth, labour, must account for the great discrepancy which appears to exist between the cost of production and the final cost. We find New York paying four times as much as London for labour, and yet the finished fireproof building, on a foot cube basis, remains practically the same.

The average life of a commercial building in New York City is said to be twenty years. We are, therefore, inclined to build rather sparsely without sacrificing efficiency and strength, while you tend to give posterity a fighting chance to admire your handiwork.

There are other things which make your material cost higher than ours. You build on earth and clay, which requires spread footings in the foundation, whereas, in New York at least, we have to deal chiefly with rock, and although rock may be more costly to excavate, it requires less in the way of substructure.

But the chief physical saving in America results from the great size of our building operations. With these huge structures, a construction company in New York may do only four or five jobs in a year, and yet have a total annual volume of business amounting to six million pounds. To do six million pounds' worth of business in London, a contractor would have to spread himself over fifty, perhaps a hundred jobs scattered all over the city, with a consequently increased overhead, and terrific confusion.

This brings me to the crux of the whole situation, the question of building organisation. When labour is 60 per cent. of your final cost, delays mount up in money with terrifying rapidity. So our big construction organisations have highly-paid men whose sole business is to prevent delays. The material must be finished on time, routed on schedule, and delivered at exactly the psychological moment—no sooner, lest it clutter the streets and otherwise impede progress, and no later, lest our millionaire bricklayers and steam-fitters pile up wages without doing any work in return. The whole progress of the building is scheduled with the same exactitude.

To sum up, I think we have found the reason why, with producing costs greater, the actual cost of the finished building in New York is practically the same as in London. There is first, the physical set-up of the buildings themselves—standard rectangular forms, less material per foot cube, and less ponderous foundations. On the physical side we have also seen that the enormous size of our buildings makes for concentration of effort, and permits more efficient systems of handling material and labour to be installed. From the point of view of organisation, we have observed that the very cost of labour has compelled us to devise ways and means whereby no labouring time is wasted. And, finally, we have found that the labourer himself is more satisfied with his lot, and hence is enabled to work more contentedly and more efficiently.

THE IDEAL HOME EXHIBITION

Heating and Lighting Section

In the heating and lighting section in the Main Hall, Messrs. Thomas Potterton, of Ravenswood Road, Balham, S.W.12 (Stand No. 88), have a display of the standardised types of "Victor" Gas Boilers, and are giving a working example of their system for supplying hot water for general domestic use. A small installation for warming purposes, with circulating water radiators heated by gas, automatically controlled, is also in operation at this Stand.

Messrs. Candy & Co., Ltd., of 87 Newman Street, Oxford Street, W.1 (Stand No. 77), are again showing a selection of "Devon" Fires, for which unlimited possibilities in decorative effect is being claimed.

Stand No. 79, occupied jointly by Messrs. L. G. Hawkins & Co., Ltd., and Kelvinator, Ltd., of 30-35 Drury Lane, W.C.2, comprises labour-saving equipment for the modern electric home. "Kelvinator" Automatic Electric Refrigeration is also a feature of this exhibit.

A representative display of electric fires, water heaters, and other domestic appliances is to be seen at Stand No. 80, occupied by Messrs. Belling & Co., of Bridge Works, Southbury Road, Enfield. Immersion Heaters, which can be fixed to existing hot-water tanks and used in conjunction with the usual hot-water system, are also shown in actual use.

A range of boilers including the "Domestikatum" Open Fire Boiler for domestic use, are being shown by Messrs. Jones & Attwood, Ltd., of Titan Works, Stourbridge (Stand No. 82).

At Stand No. 87 The London Gas Exhibit, of 84 Horseferry Road, Westminster, S.W.1, supported by the London Gas Supply Undertakings, have a series of rooms showing the application of gas for heating, lighting and cooking purposes. Here gas fires are shown in a variety of settings, and the various types of gas cookers are each built into recesses of their own so that general appearance can be judged and compared without confusion.

Messrs. Radiation, Ltd., whose registered offices are at 15 Bennett's Hill, Birmingham, have devoted Stand No. 78 to a selection of cooking and heating appliances produced by the following firms: Messrs. Arden Hill & Co., Fletcher, Russell & Co., Ltd., The Davis Gas Stove Co., Ltd., The Richmond Gas Stove and Meter Co., Ltd., Wilsons & Mathiesons, Ltd., and John Wright & Co.

"Bell" Dutch Tile Fireplaces, including the new Faience Gas Fires and some attractive designs in red sand-faced bricks, are exhibited by Messrs. A. Bell & Co., Ltd., of Kingswell Works, Northampton (Stand No. 91).

Messrs. Thorn & Huddle, Ltd., of 51 Victoria Street, S.W.1, have a comprehensive exhibit devoted to electric and acetylene lighting at Stand No. 96. Here "Pelapone" Electric Plants are shown in various sizes to suit large or small country houses; a complete plant with a battery is in

actual operation. Surface wiring systems, by means of which electricity can be installed without disturbing internal decorations, are also displayed.

Refrigeration equipment is being shown by Messrs. J. & E. Hall, Ltd., of 10 St. Swithin's Lane, E.C.1, at Stand No. 96A. The refrigerating machine here exhibited, working a cold-storage chamber, is of a new automatic type, which is completely contained within a hermetically sealed casing so that there is no gland from which any escape of the gas forming the refrigerant can take place.

The latest electrically driven "Silverlite" Petrol Gas Generator, for country houses equipped with electricity but lacking a supply of gas, is being shown at Stand No. 97 by Messrs. Spencers, Ltd., of 6 London Street, Paddington, W.2.

At Stand No. 101 Messrs. Triplex Foundry, Ltd., of Great Bridge, Staffs, are showing a number of "Triplex" Grates with varied tiling effects.

The New Open Fire "Greyt-Heat" Domestic Boiler, manufactured by Messrs. K. C. B. Foundry Co., Ltd., of 120B Mount Street, W.1, is exhibited for the first time at Stand No. 104. This boiler has been designed to meet all hot-water requirements of the modern house and at the same time to provide a cheerful open fire.

Automatic electric lighting plant, electric pumps and "Delco-Light" Battery plants for house lighting are to be seen at Stand No. 107 occupied by Messrs. The Delco-Light Co., of Imperial House, Kingsway, W.C.2. Here also is a novel development in automatic electric pumps, giving the service of a main water supply when the only source of water available is an ordinary garden well.

A display of "Frigidaire" Automatic Electric Refrigerating machines for home and commercial purposes is exhibited by Messrs. Frigidaire, Ltd., of Imperial House, Kingsway, W.C.2, at Stand No. 111. At Stand No. 29 (Main Hall Gallery) is another refrigerator exhibited by Messrs. Electrolux, of 153 Regent Street, W.1.

Stand No. 112, occupied by Messrs. The British Thomson-Houston Co., Ltd., of Rugby, is devoted to a spectacular display to popularise Mazda lamps.

"M.R." All-British Refrigerators, shown by Messrs. The Mechanical Refrigerator Co., Ltd., of 292 Regent Street, W.1, are at Stand No. 113. These units are capable of cooling cabinets of from 5 to 500 cubic feet capacity, and are designed to meet the requirements of both the domestic and the commercial user.

"Cosy" Stoves in various settings are being shown by Messrs. The Cosy Stove Co., Ltd., of 42 Berners Street, W.1, at Stand No. 116. These stoves will burn day and night, either as open fires or closed up as slow combustion stoves, using all types of fuel.

A representative selection of fireplace suites embodying the "Heaped" Fire, by Messrs. Bratt, Colbran & Co. and The "Heaped" Fire Co., Ltd., of

10 Mortimer Street, W.1, is shown at Stand No. 117. Interiors in rustless steel, one of the latest developments in fireplace manufacture, are also a feature at this Stand.

"Smoothtop" Gas Ranges and "Falco" Domestic Boilers are the chief features of Stand No. 118, occupied by Messrs. The Falkirk Iron Co., Ltd., of 76 Wells Street, Oxford Street, W.1. "Smoothtop" Ranges can be supplied with white enamelled and glass panelled oven doors.

At Stand No. 120 Messrs. Chase & Co., Ltd., of 1 Sloane Street, Knightsbridge, S.W.1, are demonstrating "pipeless" heating, using McClary's Furnace for warming, humidifying and circulating the air throughout the Stand.

A display of "Wellstood" Ranges, "Columbian" Cookers and "Esse" Anthracite Stoves and boilers is being exhibited by Messrs. Smith & Wellstood, Ltd., of Bonnybridge, Scotland (Stand No. 123). They are also showing an "Esse-Vista" stove, of new construction and finish.

A model kitchen fitted with labour-saving devices and equipped with the "Kooksjoie" Anthracite Range, delivering hot water at the rate of 30 gallons per hour, is the feature of Stand No. 122, which has been taken by Messrs. The London Warming Co., Ltd., of 18-19 Upper Rathbone Place, Oxford Street, W.1. This firm is also showing their "A.O.C." Grate for the continuous burning of anthracite and the "LoCoCo" Combination Grate for housing schemes.

At Stand No. 125 Messrs. The Interoven Stove Co., Ltd., of 156 Charing Cross Road, W.C.2, are demonstrating "Interoven" and "Super-Interoven" Convertible Cooking and Heating Stoves.

The Patent "Foresight" Range and the New "Foresight Junior" Combination Stove, with other grates and ranges made by Messrs. Samuel Smith & Sons, Ltd., of Beehive Foundry, Smethwick, are at Stand No. 121.

Messrs. Express Boilers, Ltd., of 65 Great Portland Street, W.1, occupying Stand No. 88 (Main Hall Gallery), are exhibiting "Express Boilers," which can be fitted over the kitchen sink and arranged to give a supply of hot water to the bathroom.

Gas cookers made by Messrs. The New Stimex Gas Stove Co., Ltd., of Stimex House, Balham Hill, S.W.12, including several new models of the domestic type, are to be found at Stand No. 89.

The "Halliday" Water Heater and Circulating Boiler, made by Messrs. Halliday Boilers, Ltd., of Saxon Road, Selhurst, S.E.25, is being shown at the C.S.A. House in the Housing Section (Stand No. 40, New Hall). This heater is gas fired, and can be fitted to any existing hot water system, being clamped to the circulating pipes, which are pierced to take the inlet and outlet.

(Continued on page 460)

Legal Notes

The Specific Performance of a Contract

In the Chancery Division recently, before Mr. Justice Russell, Mrs. Catherine Ffoulkes, of Plas Newydd, Pwllheli, Carnarvon, asked for the specific performance of a contract of January 4, 1926, by Mr. Joshua Clibborn Thompson, of Semley Court Road, Bournemouth, to purchase Plas Newydd and certain land for £3,000. Defendant counter-claimed for the return of £300, paid as deposit, with a rescission of the contract. Defendant complained of particulars given by Harrod's Estate Office, Brompton Road, and the local agents, Messrs. Yates and Hardeastle. Defendant said he acted on a description that the house was unusually well built and everything in first-class order, and also on an oral statement by the plaintiff to the same effect. The defence further suggested that the window on the south side admitted the rain between the casement and the plaster, and the house was built in the cheapest way known and with the cheapest material. Further, it was said the roof was defective and not rainproof, and was made without regard to any recognised form or canon of construction.

Mr. Gavin T. Simonds, K.C., and Mr. Pattison appeared for plaintiff, and Mr. Luxmoore, K.C., and Mr. Longson were for the defendant.

The onus being on the defendant, Mr. Luxmoore, opening, said the house was of white stucco exterior with Marseilles tiles. There would be a question as to whether the words in the announcements were representations of fact or merely laudatory epithets, but the plaintiff would not deny she was responsible for them. Eminent architects would give evidence on both sides. Harrod's advertisement in the *Times* on September 21 spoke of "Delightful house with glorious view, Pwllheli, beauty spot of North Wales, unexpectedly for sale, really attractive residence, unusually well built, erected under care of eminent architect." Other amenities were advertised. Mrs. Thompson was upset when in the attic she saw the sky between the tiles fixed on battens.

Defendant stated that plaintiff told him more than once that the house and foundations were well built.

In cross-examination, witness said he saw Yates and Hardeastle, and found that it was the same house of which Harrods had given a more attractive description. He dealt with the local agents. He did not remember saying to them the place was very crude, and would want a lot of money spent on it. Except for one big room and the hall it was a bungalow.

Mr. Llewellyn Lloyd-Jones, architect and surveyor, of Carnarvon, said that on January 27 he made a second examination of the house as a fabric. The rain drove through the roof. There was only cement under the roof tiles in the four lowest courses. He afterwards found a bending movement in the rafters and purlings, the roof showing signs of stress under its light construction.

Mr. Charles Fitzroy Doll, F.R.I.B.A., F.S.I., of Messrs. C. Fitzroy & Sons of Southampton Street, Bloomsbury, stated that he inspected Plas Newydd. The description in the particulars for sale that this house was unusually well built was not, in his opinion, a fair description of the property. The roof was not carpentry, but simply timbers nailed together. In fact the roof was the skin of a body without any skeleton. There were other defects in the construction, but the roof was by far the most important, and he did not consider it was safe.

In cross-examination, he admitted he had had no experience of constructing roofs with Marseilles tiles.

Mr. Ernest Godfrey Page, A.R.I.B.A., of Gray's Inn Place, giving evidence for plaintiff, said he had been in practice 28 years. He had been concerned as

consultant for many years, as well as carrying out of public and domestic buildings. He had inspected Plas Newydd, and the only criticism he could make of the roof was that there was one leak, and he would put one diagonal strut or truss at each end. If the view of the defendant's witnesses was right, his opinion was that it would collapse. He was satisfied that the method of construction was both theoretically and practically sound.

His Lordship, giving judgment, said this was no an easy case to decide, but he had come to the conclusion that the statement that the house "was unusually well built" was untrue, and he was quite satisfied it was a cheaply built house. Then there was the question of the roof, which raised questions full of technicalities, leaving the matter in hopeless conflict, but he was satisfied that the minimum strength of roof timber had been used and the roof was not properly constructed. The action would be dismissed with costs, and the counter-claim must succeed, with a rescission of the contract and the return of the deposit.

Book Notices

Paperhanging. By W. H. Cantrill and W. G. Sutherland. (The Sutherland Publishing Co., Ltd.) Price 2s. 6d.

This small volume has been prepared to meet the need for a sound and practical work on paperhanging, suited alike to the requirements of instructor, apprentice, and craftsman.

Builders' Accounts and Office Supervision. By Hardy Keen. (Crosby, Lockwood & Son.) 3s. net.

The main aim in the compilation of this book has been how to make a building business remunerative, and to provide an aid to the principal and clerk of a business and to students of the trade.

Historic Ornament. By Richard Glazier. (B. T. Batsford, Ltd.) Price 12s. 6d. net.

While attempting to broaden its scope and increase its usefulness, the object of the book, to give a concise general view of Historic Ornament, and to supply a handy manual for students and schools, has been kept in mind and maintained.

Architectural Construction. Vol. II. By Walter C. Voss and Edward A. Varey. (Chapman & Hall.) 32s. 6d. net.

This volume has been sub-divided into five books, as follows: Book I.—Wood Construction: Book II.—Steel Construction: Book III.—Concrete Construction: Book IV.—Walls and Foundations: Book V.—The Mechanics of Structural Design.

Messrs. R. A. Skelton & Co., Steel and Structural Engineering, Ltd., of Moorgate Station Chambers, London, E.C.2, have sent us a copy of their new handbook (No. 20) on "Steel Construction," which is essentially a revised edition of the technical portions of their structural steel handbook (No. 16), published in 1915, but now out of print. This book has been published for the use of engineers engaged in the design of steel structures, and aims at giving all necessary details, not merely of the steel sections rolled by a particular manufacturer, or stocked by a particular merchant, but of all the standard sections available. Most of the tables of safe loads published by manufacturers and others give little or no information as to the mode of calculation, but since the engineer may wish to satisfy himself that the basis of calculation is correct, in this book the necessary information is given at the foot of every table. Those portions of the original handbook which are not strictly relevant to the purposes of the designing engineer have been relegated to a separate volume

London Building Notes

BASINGHALL STREET.—The contract for the new building to be erected on the site at the corner of Basinghall Street and Gresham Street, E.C.2, referred to in "The Architect and Building News" last week, has, we are informed, been placed with Messrs. G. E. Wallis & Sons, Ltd., London and Maidstone. Demolition work is now being completed by Messrs. H. Sabey & Co., Ltd., South Wharf, Paddington, W.2. The architects are Messrs. Robert Angell & Curtis, 133 Regent Street, W.1.

BATTERSEA.—Building is to commence shortly on a site in Clapham Road, S.W., where it is proposed to erect a motor service depot, including a public garage and workshops, private lock-ups, etc. Plans have been prepared by Mr. Charles Living, P.A.S.I., 75 The Grove, Stratford, E.15.

BECONTREE.—Work has been started upon the balance section of the Becontree Housing Estate, where the L.C.C. propose to build 2,137 houses, shops, a school and a church, at a cost of £1,250,000. The contractors are Messrs. C. J. Wills & Co., Ltd., 28 Victoria Street, S.W.1, the work being under the supervision of Mr. G. Topham Forrest, F.R.I.B.A.

CLAPHAM COMMON.—The Governors of the South London Hospital for Women are appealing for funds in order to carry out a scheme of enlargement at their premises at South Side, Clapham Common, S.W. It is proposed to build a large ward block, at a cost of about £50,000-£60,000. The plans will be prepared by the Hospital architect, Sir Edwin Cooper, F.R.I.B.A., 4 Verulam Buildings, Gray's Inn, W.C.1.

DARTFORD.—The Metropolitan Asylums Board have decided to carry out a scheme of reconstruction at Long Reach Hospital, at an estimated cost of £75,000. It is proposed to rebuild 7 ward blocks, 1 isolation block, 5 staff blocks, kitchen, etc. Plans are being prepared by Mr. T. Cooper, M.Inst.C.E., Engineer-in-Chief to the Board.

ESSEX STREET.—New offices, etc., are to be erected by the proprietors of the *Illustrated London News* and the *Sketch*, of 15 Essex Street, Strand, W.C., upon the adjacent vacant site at No. 17 Essex Street. Plans have been prepared by Messrs. George & T. S. Vickery, F.R.I.B.A., 50 Gresham Street, E.C.2.

FULHAM.—Tenders are to be shortly considered for the carrying out of the extensive structural work at the Fulham Board of Guardians' Belmont Institution. Plans for the new work have been prepared by Messrs. A. Saxon Snell & Phillips, 9 Bentwick Street, Manchester Square, W.1.

GRAY'S INN ROAD.—It is proposed to expend the sum of £200,000 upon the further enlargement of the Royal Free Hospital in Gray's Inn Road, W.C. The plans will be prepared by Messrs. H. V. Ashley & Winton Newman, F.R.I.B.A., 14 Gray's Inn Square, W.C.

HIGHGATE.—It is proposed to build a new pathological laboratory, X-ray

room, etc., at the Highgate Hospital in Dartmouth Park Road, N.9, at a cost of several thousand pounds. Plans have been prepared by Messrs. H. V. Ashley & Winton Newman, F.R.I.B.A., 14 Gray's Inn Square, W.C.

HIGH HOLBORN.—A large area of building land, with an area of 13,000 square feet and a frontage of 63 feet to Red Lion Street, W.C., is to be let on building lease shortly at £600 per year. The surveyors are Messrs. Weatherall & Green, Chancery Lane, W.C.2.

ISLINGTON.—The Governors of the London Fever Hospital for Infectious Fevers at Islington, N.1, have decided to launch an appeal for £25,000. Of this sum it is proposed to expend £6,000 on repairs and renewals and £10,000 upon the reconstruction of the isolation block. Lord Ebury is the president.

KINGSTON-ON-THAMES.—Plans, prepared by Messrs. A. W. Jarvis, A.R.I.B.A., and F. A. Richards, F.R.I.B.A., 60 Tufton Street, Westminster, S.W.1, are now before the Board of Education in connection with the proposal to build a new Tiffin's Boys' School for the Kingston Education Committee. The cost of the buildings is estimated at £41,850.

LEWISHAM.—Lewisham Hippodrome has been bought from Mr. Charles Gulliver by Mr. A. E. Abrahams, and has been leased by him to Mr. Sidney Bernstein, who will reopen the house in September as a cinema theatre. The theatre will be improved and re-decorated under the supervision of M. Komisarjevsky.

PICCADILLY.—Work has now started on the foundations of the new block of flats and shops which are to be built on the site (20,500 square feet) at the corner of Piccadilly and Stratton Street, W.1, for Stratton House, Ltd. The contractors are Messrs. Holloway Bros. (London), Ltd., Bridge Wharf, Grosvenor Road, S.W.1. The building has been designed by Mr. W. Curtis Green, A.R.A., 5 Pickering Place, S.W.1, and will be nine storeys high, faced with Portland stone.

REGENTS PARK.—The estate of Abbey Lodge, near Hanover Gate, W.1, has been acquired by Messrs. Ernest Yates & Co., estate agents, 37 New Bond Street, W.1. It is proposed to develop the area by the erection of a block of buildings containing about 60 self-contained flats. A large restaurant and hall is projected.

REGENT STREET.—Work is in progress upon the second and third sections of the scheme for the complete rebuilding of the premises of the Café Royal in Regent Street and Glasshouse Street, W.1, the total cost of which is estimated at £500,000. The present two sections are being built by Messrs. Higgs & Hill, Ltd., Crown Works, South Lambeth Road, S.W. The plans have been prepared by Messrs. Henry Tanner, 3 Hanover Square, W.1.

SMITHFIELD.—About £200,000 is to be expended upon the building and equipping of a new surgical block at St. Bartholomew's Hospital in Smithfield, E.C.1. A building of five floors is to

be erected. The architects to the Hospital are Messrs. J. Douglass Mathews, Son & Ridley, 3 Pauls Bakehouse Court, E.C.3.

SOUTH NORWOOD.—Plans have been approved by the licensing authorities for the erection of a picture theatre and café in Broadway, South Norwood, S.E.25. It is proposed to build on the site of Nos. 160-162 and to provide accommodation for about 1,200 persons. Plans have been prepared by Mr. F. Edward Jones, Gloucester Mansions, Cambridge Circus, W.C.2.

SOUTHWARK BRIDGE.—The L.C.C. have recently approved, under the "London Building Act, 1894—Height of Buildings," the erection of a warehouse on a site abutting upon the western side of Queen Street Place, Southwark Bridge, E.C., to be of a greater height than that prescribed by the Act. The plans have been prepared by Messrs. Kersey, Gale & Spooner, 91 Moorgate, E.C.2, acting on behalf of the Vintners Company.

ST. PANCRAS.—An expenditure of about £45,000 is involved in the rebuilding of the Brecknock School at St. Pancras, N.W.1, which has been decided upon by the Governing Committee. The builders, Messrs. Humphreys, Ltd., 187 Knightsbridge, S.W.7, commenced work recently on the site. The plans have been prepared by Mr. G. Topham Forrest, F.R.I.B.A.

SUTTON.—The Surrey County Council have approved a scheme for the erection of a secondary school at Sutton, the estimated cost of the buildings and their equipment being £46,500. Plans have been prepared by Messrs. A. W. Jarvis, A.R.I.B.A., and F. A. Richards, F.R.I.B.A., 60 Tufton Street, Westminster, S.W.1.

THORNTON HEATH.—Plans have been prepared for the carrying out of improvements to the Maybury Road Hospital at Thornton Heath, which will involve alterations and additions to the buildings. The work will be supervised by the architect, Mr. H. Biney, 33 High Street, Croydon.

TWICKENHAM.—It is proposed to build a new memorial hall at the junction of Radnor and Grotto Roads, Twickenham, in connection with St. James's Roman Catholic Church. Plans have been prepared by Mr. T. H. B. Scott, L.R.I.B.A., 11-12 Finsbury Square, E.C.2, and have been approved by the local authority.

WEST END.—The Hungarian Government has assigned the sum of £11,600 for the purchase of the freehold of premises for a new Hungarian Legation building in London. The present Legation is at 53 Chester Square, S.W.1.

WESTMINSTER.—The "Phoenix" public-house in Princes Street, Westminster, S.W.1, owned by Messrs. Watney, Combe, Reid & Co., Ltd., Stag Brewery, Westminster, S.W., is to be rebuilt and enlarged, an extensive restaurant being added. The contract is being carried out by Mr. F. R. Hipperson, 6 Broad Street Place, E.C.2, under the direction of the brewery surveyor.

The Week's Building News

The following abbreviations are used: U.D.C. for Urban District Council; T.C. for Town Council; R.D.C. for Rural District Council; E.C. for Education Committee; B.G. for Board of Guardians; P.C. for Parish Council; B.C. for Borough Council; M.H. for Ministry of Health; M.T. for Ministry of Transport; C.B. for County Borough; B.E. for Board of Education. Direct confirmation should be obtained before commitments, for which we cannot be responsible, are made.

ABERDEEN.—A cinema development involving an estimated expenditure of £60,000, and intended to provide Aberdeen with what, it is stated, will be the largest picture theatre in Scotland, out of Glasgow, is to be inaugurated.

ATCHAM.—A contract for the erection of a new concrete bridge over the River Severn at Atcham, near Shrewsbury, has been secured by Messrs. Gray's Ferro Concrete Company, 201 Bath Street, Glasgow. The work is for the Salop County Council, and the bridge, which will be of five spans, will be about 500 ft. long. It is estimated that the cost will be £60,000.

AYR.—At a special meeting of Ayr T.C. recently, it was agreed to take steps for the compulsory acquirement of about 32 acres of land at Lochside for the purpose of a housing scheme. It was further agreed that, subject to the approval of the Board of Health, 300 flatted houses be erected on the site—200 of two apartments and 100 of three apartments. In addition, it was decided to erect at the same site 52 houses to replace houses demolished under a slum clearance scheme. These houses are to be erected in blocks, 40 of them to be two-apartment houses and 12 three-apartment houses.

BALLYMONEY.—At Ballymoney R.C. recently, the Ministry of Home Affairs wrote sanctioning the borrowing of £30,000 for the erection of 86 cottages.

BARNES.—In connection with the development of the Castelnau housing estate at Barnes, where about 600 houses are to be built, the L.C.C. are arranging for some 60 houses to be on the all-electric principle for experimental purposes.

BECKENHAM.—Messrs. Overal & Son are to erect houses in a new road, to be called Kelsey Way, off Manor Way, Beckenham.

BECKENHAM.—The U.D.C. have given sanction for the erection of 27 houses in Croydon Road, by Mr. S. G. Gee, and 24 in Ravensbourne Avenue, by Messrs. W. Reynolds & Co.

BEDFORDSHIRE.—Plans have been prepared for a garden city at Westoning (Beds.), with a station on the L.M.S. Railway.

BELFAST.—Messrs. Harry Ferguson, Ltd., Belfast, are permanently extending their showrooms at 3 Bedford Street and No. 1 Howard Street, taking in the whole corner of these two streets.

BIRMINGHAM.—A site in Hob Moor Road, Small Heath, has been selected for the proposed new Unionist Club for the Yardley Division of Birmingham. Mr. John White is the architect. The cost is £6,500.

BODMIN.—The T.C. have decided upon the erection of 12 houses on a site in Burnard's Lane.

BOLTON.—The Corporation Housing Committee has placed tenders for the erection of 118 houses on the Higher

Swan Lane site and 312 on the Mortfield estate. The houses are of the working-class cottage type.

BRADFORD.—The Corporation have obtained the sanction of the M.H. for the erection by direct labour of 150 houses at Wyke. In connection with the erection by contract of 326 houses at Eccleshill, tenders are to be invited for various methods of construction.

BRIDGNORTH.—Owing to the great increase in the number of in-patients admitted for treatment at the Bridgnorth and South Shropshire Infirmary, it has been found necessary to enlarge the staff of nurses and undertake such alterations to the premises as will provide two extra wards and four staff bedrooms. The total cost of these alterations and improvements is estimated at £2,000.

BRIDGWATER.—The T.C. recently adopted two schemes for laying out Victoria Park and Eastover Park, at a total estimated cost of £6,400, the scheme including the provision of tennis courts, bowling green, and shelters.

BRISTOL.—A building scheme estimated to cost £65,000 was submitted to the City Council recently by the Baths Committee.

BURTON.—Burton Corporation was recently asked to pronounce on the proposal of the Housing Committee to buy a 40-acre site at Stapen Hill. Last month the Council referred the scheme back to the committee. The committee now asked that the purchase of the site should be approved, and its development at a cost of nearly £200,000 be deferred.

BURTON-ON-TRENT.—The Corporation have obtained land for another housing scheme at Winhill, and plans are to be prepared for the erection of 56 houses.

CATERHAM.—A scheme for the extension of the nurses' home at Caterham Asylum, at a cost of £8,000, has been prepared by the Metropolitan Asylums Board.

CHELTENHAM.—The M.H. have sanctioned the proposal of the Cheltenham Corporation to erect 80 houses on the Hanover Street housing estate, in accordance with plans prepared by Mr. Malvern.

CHESTERFIELD.—The Chesterfield Brewery Co., Ltd., Chesterfield, have acquired a site on the main road from Staveley to Chesterfield, where they propose to erect a new hotel. The plans are being prepared by Messrs. Clayton & Rignall, architects, Corporation Street, Chesterfield. No contracts have yet been placed.

CLERKENWELL.—The L.C.C. is recommended to accept £20,000 for the disused Sessions House at Clerkenwell.

COLCHESTER.—It is proposed to extend the Royal Grammar School at an estimated cost of £6,620.

COULSDON AND PURLEY.—The U.D.C. are to purchase land for £2,956 for a third housing scheme.

DARLINGTON.—The T.C. recently appointed a committee to consider and report upon the question of the erection of a new town hall and municipal buildings.

DERBY.—The Parks and Baths Committee recently recommended consent being given for the erection of new baths in the borough at the cost of £87,000, the frontage land in Queen Street to be utilised principally for shops.

DUNBAR.—Dunbar T.C., with the approval of the Board of Health, have agreed to proceed with another housing scheme, comprising 42 houses (32 three-roomed and 10 four-roomed houses) and tenders having been accepted, the work will be proceeded with immediately.

ESSEX.—Among the plans recently recommended for approval, subject to compliance with the by-laws, was one for the Crittall Manufacturing Co., Braintree, Essex, for a warehouse, offices, dwelling-house, etc., on land at the corner of Cray Road, near Sidcup by-pass.

EXHALL.—The Warwickshire E.C. are to erect a central school at Ash Green, and are inviting tenders for the work. Mr. A. C. Bunch, F.R.I.B.A., is the County Architect.

FLEETWOOD.—The Fleetwood U.D.C. are proposing to erect a War Memorial in Warrenhurst Park, Fleetwood. The architect for the scheme is Mr. B. Drummond, A.R.I.B.A., 54 Adelaide Street, Fleetwood, and the sculptor is Mr. Tyson Smith, 169 Grove Street, Liverpool.

GLASGOW.—At a sitting of Glasgow Dean of Guild Court recently, the Rev. Dr. George Duncan, Moderator, representing the Presbytery of Glasgow, was granted permission to erect a church, etc., at the junction of Cumbernauld Road and Smithycroft Road. Other linings sanctioned permitted the trustees for St. Martin's Episcopal Church, Polmadie, to make additions to the church in Aitkenhead Road; the Martyrs' Christian Bond, to erect a hall at Alexandra Parade; Messrs. Smiths (Glasgow), Ltd., 84 Gordon Street, to reconstruct and erect warehouses, etc., at 164-168 Sauchiehall Street and 81-85 Renfrew Street, which involves the closing of the Wellington Arcade; and Glasgow Corporation to form streets and sewers for new housing schemes at Low Baler-nock and at Belslard Drive, Ruchill, and also to erect electricity sub-stations at Dawsholm Works and Kingsbarns Drive, King's Park.

HARTSHORNE.—The Hartshorne and Seals R.D.C. are to erect further houses, and the Council's architect, Mr. A. C. Clarke, is to complete plans and specifications and invite tenders for their erection.

HIMLEY.—A scheme for the extension of the Limes Sanatorium has been

No. 4

Transportation

The stowing of Marseilles Tiles into barges is the link between the works and the ocean-going steamers. The barges are drawn up alongside the quay upon which the tiles are stacked—barrows being used between the stacks and the barges.

The stowing is done just as carefully and as systematically as the stacking, and years of experience have resulted in methods which have entirely eliminated breakage.

LANGLEY LONDON LIMITED

161 BOROUGH HIGH STREET, LONDON, S.E.1

MARSEILLES
ROOFING — TILES

approved by the Staffordshire, Wolverhampton and Dudley Joint Committee for Tuberculosis. The cost of the complete scheme, as originally decided, was stated to be £36,540.

ISLINGTON.—The erection of Islington's new Municipal Public Hall in Tyndale Place, Upper Street, will be commenced this month.

KENMUIR.—Lanark C.C. are to erect tenements at Kenmuir at a cost of £4,000.

KENSINGTON.—Sir Aston Webb & Son are to erect premises at the corner of Finborough Road and Richmond Road, Kensington.

KIRKHAM. — Mr. F. Harrison, L.R.I.B.A., architect, 30 Willow Street, Accrington, has submitted schemes to the Fylde B.G. for the extension of their hospital at Moss Side, Kirkham, Lancs.

LIVERPOOL.—Electricity Department proposes to spend £15,800 on new sub-station buildings and £80,000 on new static sub-stations.

LIVERPOOL.—The Liverpool justices recently approved plans for a new £40,000 dance hall in Beech Street, Fairfield. It was stated that the hall would be built at once by Mr. R. Gordon Kitchen.

LONDON.—Plans are being prepared for a new block of premises, on a new site, for the Rye Lane branch of the Co-operative Society.

LYTHAM ST. ANNES.—Detailed estimates of the cost of building 80 houses at St. Annes, Andsell and Lytham have been got out, and application is to be made for permission to borrow £40,092 for the work.

LYTHAM ST. ANNES. — The New Church, Lytham St. Annes, is to build a church on the Star Hills estate at the corner of Ansdell Road South and Cambridge Drive. Architect, Mr. Thos. Hedges, Bank Chambers, Clifton Square, Lytham. The building will cost about £2,500. The contract has been let to Mr. John Monaghan, contractor, 2 Lightbourne Avenue, St. Annes-on-Sea. The work is just commencing.

MACCLESFIELD. — The Macclesfield and District Farmers' Trading Society, Ltd., are proposing to make additions to their premises facing Castle Street. Architects, Messrs. Whittaker & Bradburn, 19 King Edward Street.

MONMOUTHSHIRE.—The County E.C. intend to erect an elementary school for boys at Newbridge. The architect is Mr. John Bain, F.R.I.B.A.

NEWPORT.—The Newport Parliamentary Committee recently discussed the erection of a new civic centre, and the officials were asked to prepare a further report. This report will have reference to a new site in Park Square, to accommodate a town hall only, as well as the Clytha Park site and the existing islands site which have already been considered. The committee also instructed the officials to prepare a report on the question of widening Dock Street from High Street down, and an alternative suggestion for a new relief road behind Dock Street by filling up a portion of the Monmouthshire Canal.

NEWTON ABBOT.—Broadlands House, at Newton Abbot, the residence of Mr. and Mrs. F. F. Card,

which is part of the estate on which Newton Abbot U.C. are building nearly 300 houses, is to be purchased by Devon E.C. for use as a senior girls' school in connection with the Highweek Council Schools.

NEWTON ABBOT.—The U.D.C. are to build 54 houses on the Broadlands estate.

NORTHWICH.—The U.C. recently decided to co-operate with Messrs. Brunner, Mond & Co. by raising a loan for the erection of 200 houses for workmen employed by the firm. The houses are to be commenced immediately.

PLYMOUTH. — The E.C. have appointed Mr. Charles Cheverton as architect for the new elementary school at North Prospect.

PONTEFRAC T.—The Pontefract T.C. recently instructed the surveyor to prepare plans for the erection of a new school near the Baghill housing site (where the Council have already erected 220 houses and have 270 others in hand) capable of accommodating 550 children, and ultimately 1,000.

POOLE.—A recommendation that the Borough Engineer (Mr. E. J. Goodacre) be instructed to prepare a scheme for the complete development of the Park Gates East site for the erection of municipal buildings, recently came before the meeting of the Poole B.C.

PUDSEY.—The Corporation are to erect 96 houses on the Southroyd Park estate.

SALTCOATS.—The T.C. are to erect an entertainment pavilion on Winton Terrace, near the bathing pond, with a frontage to Sidney Street. There will be four shops, verandahs, shelters, etc. The estimated cost is about £4,000.

SCARBOROUGH. — The Scarborough Hospital and Dispensary, Friars Entry, Scarborough, have under consideration a scheme to erect new buildings instead of extending the present institution, at an estimated cost of £40,000.

SHEFFIELD.—The Sheffield Empire is to be converted by Moss Empires, Ltd., from a music hall into a modern theatre. The present theatre was built in 1895 at a cost of £65,000, from the designs of Mr. Frank Matcham.

SIRHOWY.—The erection of 2,000 houses at a cost of about £1,000,000 is the feature of a scheme which is in course of development at Pontllanfraith, in the Sirhowy Valley of Monmouthshire.

SOUTHEND.—A proposal for a new pavilion to replace the present structure a short distance from the pier entrance with a convenient approach at an estimated cost of £70,000, is under the consideration of the T.C. The erection of a concert hall on the West Cliff is another project to be discussed.

SOUTH SHIELDS.—On behalf of Messrs. A. Holmes & Co. a lay-out has been prepared by Messrs. T. A. Page & Son, architects, for the erection of 55 houses on land belonging to the Ecclesiastical Commissioners at Mortimer Road and King George Road.

STACKSTEADS.—St. Joseph's Church at Stacksteads, near Bacup, have acquired a site at Hattock End Lane, Stacksteads, where they propose to erect a new church. The plans are

being prepared by Mr. R. Byrom, A.R.I.B.A., chartered architect, of Silver Street, Bury. The contract has not yet been placed.

STAFFORD.—The T.C. propose to make extensions to St. John's Market Hall at an estimated cost of £7,500.

STREATHAM HILL.—A ballroom of 9,800 square feet is to be built near Streatham Hill station.

TIVERTON.—A scheme for rebuilding and developing Tiverton War Memorial Library on Angel Hill, at an approximate cost of £7,000, was recently officially launched at a public meeting at the Town Hall. The plans prepared by Captain Dixon, a local architect, provide for the widening of the thoroughfare at a point where the roadway is only about 14 ft., and where three streets converged, to a width of 40 ft.; a room of remembrance; a spacious library, and an assembly hall to seat about 150, with a large basement, and rooms for caretakers.

TORQUAY.—The Borough Engineer has prepared a lay-out for the erection of 50 houses, to complete the Windmill Hill housing estate.

WARRINGTON. — Messrs. Greenall, Whitley & Co., Ltd., brewers, Wilderspool Brewery, Warrington, are to erect new licensed premises on a site which has frontages to Sankey Street, Golborne Street, and Regent Street, Warrington. The plans are being prepared by Messrs. William and Segar Owen, Springfield Street, Warrington. No contracts have yet been placed. Messrs. Cunningham's Brewery, of Warrington, are proposing to make extensions to the Adelphi Inn, Harrogate Street, Warrington. The plans have been prepared by Messrs. W. C. Ralph & Sons, architects and surveyors, King Street, Wigan. The contract has not yet been placed.

WATH-UPON-DEARNE.—Messrs. Whitworth & Son & Nephew, Ltd., brewers, Wath-upon-Deane, near Rotherham, are proposing to carry out improvements to the Sportsman Inn, Low Valley, Darfield, near Barnsley. Mr. J. R. Wilkinson, L.R.I.B.A., Architect, 15 Regent Street, Barnsley. No contracts have yet been placed.

WESSEX.—The proposed foundation of a University for Wessex, with the University College of Southampton as its basis, was discussed at a meeting held in Bournemouth recently, when a resolution approving the scheme and promising support from Bournemouth and district was carried.

WHARFEDALE.—Plans were recently approved for semi-detached houses on the Tranmere estate for Messrs. Thompson & Proctor; detached house, Alwoodley Lane, for Mr. H. de Barriette; detached house, Primley Park Avenue, Moortown, for Mr. E. Ramsden; bungalow, Sandy Walk, Branhope, for Mr. L. McDermott.

WORKSOP.—The Worksop and District Orthopaedic Guild at Worksop, Notts., have a scheme for the erection of an open-air school for crippled children, to be erected on a site near Harlow Wood, between Mansfield and Nottingham. Mr. H. G. Watkins, of Messrs. Bromley & Watkins, F.F.R.I.B.A., Prudential Buildings, Nottingham, is the architect.

The Hall Mark of Your Craftsmanship

M.G.P.

TASTE in Room Decoration has never reached so high a level as to-day. The vogue of period furnishing—the increasingly refined decorative art in modern schemes—each demands consistency in colour and treatment, even with regard to the finish of Switches and Bell Pushes. In this connection nothing offers greater scope for varied and tasteful effect than “Crabtree” Shelloid Switch Plates. Among the variety of finishes—

GOLD
AMBER
IVORY
LAPIS LAZULI
CORAL
TORTOISE SHELL
GREY MARBLE, Etc.

will be found something to harmonise with any decorative scheme.

To see these Plates in their actual colouring is to recognise how they set on your work the Hallmark of “Craftsmen in Electrical Switches”

A SUGGESTION

MAY we suggest that before purchasing Fireplace Suites or Sanitary Appliances you and your Clients should visit our recently re-arranged Showrooms at 17 & 18 Upper Thames Street, London, E.C.4.

The range of Fireplace Suites offered for inspection is a very wide one. A special feature is the number of beautiful Period Designs, many of which we owe to our own craftsmen of a century ago.

The Register Grate illustrated is in Armour Bright finish and fitted with the Hot Hearth Fire. It is particularly suitable for office or country house use.

Essay Competition

Essays are invited by the Institution of Municipal and County Engineers (Yorkshire district) for a competition to be written on one of the following subjects: (1) The Fixing of the Widths of Arterial Roads; (2) Sewerage Systems, with special reference to the run-off of surface waters, but not to include sewage disposal; (3) Road Surfaces for Different Conditions of Traffic: (a) materials, (b) climatic conditions. If a sufficient number of entrants compete, the following prizes will be awarded: First prize, £2 2s.; second prize, £1 11s. 6d. Full particulars from Mr. Percy Morris, hon. secretary of the Yorkshire District, Institution of Municipal and County Engineers, Town Hall, Wakefield.

Abingdon Bridge

The proposals for rebuilding Abingdon Bridge were recently considered by the Finance and General Purposes Committee of the Berkshire County Council, and their report will be presented to the Council at their next meeting. The special section—a committee consisting of members of the Berks and Oxford County Councils—has reported that a design for the widening and reconstruction of the half of the bridge on the Oxfordshire side, including the navigation arch, has been provisionally agreed upon, and also approved by the Office of Works and the president of the R.I.B.A.

EAST AND WEST MOLESEY.—For the erection of 44 parlour houses, for the U.D.C., the tender of Messrs. Wheatley & Sons, East Molesey, at £21,206, has been accepted; whilst for the erection of 30 non-parlour houses, the tender of the Triangular Construction Co., Ltd., Imber Court, at £12,490, has been accepted. Architect, Mr. T. Frank Hawkes.

FULFORD (STAFFS).—The tender of Messrs. Tompkinson & Betteley, Longton, at £4,263, has been accepted for the erection and completion of a new Council School to accommodate 120 children, by the Staffordshire E.C.

GLASGOW.—The Corporation Housing Committee recommend the following tenders for the erection of 300 houses at Germiston: Mason work, Mr. John Taylor, £42,129 12s. 6d.; joiner work, Mr. Samuel M. Stark, £24,813 16s.; slater work, Messrs. Thomas Stewart & Co., £4,486 5s. 4½d.; plumber work, Messrs. John Paterson & Co. (Plumbers), Ltd., £18,555; glazier work, Mr. James P. M'Phie, £852 13s. 7d.

GLASGOW.—The Corporation Housing Committee recommend the revised tender of Messrs. Brown, Fraser & Co. for the erection of 192 houses at Germiston at prices of £350 and £391 per house.

HAMPTON.—The U.D.C. have accepted the tender, £15,278, of Mr. W. H. Pecover, of East Sheen, for the erection of 38 houses at the Hanworth Road site.

ISLINGTON.—For the groundwork and draining at the playing field at Finchley, acquired for the use of Holloway Schools: Howard Farrow, 1 Russell Parade, Golder's Green Road, N.W.11, £1,135 (accepted); R. Neal & Sons, Ltd., Wandsworth, £1,168; D. R. Paterson, Ltd., Camden Town, £1,195; Mears Bros., Lewisham, £1,223; Edward B. Yewen, Croydon, £1,249; George Bell & Sons, Ltd., Tottenham, £1,544.

LEAMINGTON.—The tender of Messrs. Atkins & Bennett, of 3 Windsor Street, Leamington Spa, has been accepted for the erection of 8 houses in Cubbington Road.

LEICESTER.—The tender of Messrs. H. Herbert & Sons for the extensions of the Leicester Colleges of Art and Technology has been accepted, at £39,649, by the Leicester E.C.

LEWISHAM.—The L.C.C. Education Committee recommend the tender, £23,656, of Messrs. W. H. Gaze & Sons, Ltd., of Kingston, for the reconstruction of the Dalmain Road Elementary School, Lewisham.

LIVERPOOL.—The City Council has accepted the tender of Brown & Backhouse for the erection of an electric sub-station in Wavertree Vale for £1,338; also that of Bragg & Collins, Fozaberley Road, Walton, for a sub-station in Prescott Road for £1,302.

LIVERPOOL.—The Corporation have accepted, subject to approval of the M.H., the offer of C. J. Doyle, of 15 Victoria Street, Liverpool, to build 16 parlour type houses on the Norris Green Estate, at the same price per house as in the existing contract for 500 houses.

LIVERPOOL.—The Cenotaph (Special) Committee have accepted the tender of Messrs. William Thornton & Sons, Ltd., of 38 Wellington Road, Liverpool, for the removal of the Beaconsfield Statue from its present position to the position on the Plateau of St. George's Hall indicated on the plan prepared by Prof. C. H. Reilly, M.A., for the sum of £178.

LONDON.—The Metropolitan Asylums Board recommend the tender, £3,022 11s. 6d., of Messrs. Carrington, Thomas & Co., Ltd., of Beckenham, for demolishing buildings and constructing a steel roof at the South Western ambulance station.

MANSFIELD.—The Mansfield Woodhouse U.D.C. have accepted the tender submitted by Mr. Hedley Rouse, builder, Mansfield Woodhouse, Notts, subject to the approval of the M.H., for the erection of 30 houses of five type 14 parlour and 16 non-parlour, all to be built in pairs, on the Clipstone Road housing site.

ROTHERHAM.—The R.D.C. have accepted a tender for the erection of 18 houses at Careliffe, at £8,235.

ROTHERHAM.—Rotherham R.D.C. have placed a contract for the erection of 51 houses at Brampton Bierlow with Messrs. Thos. Barker & Sons, at £22,296, and for the construction of roads and sewers, at £2,128.

ROTHERHAM.—The R.D.C. recently sealed a contract with Messrs. Thomas Barker & Sons for the erection of 51 houses at Brampton Bierlow at a cost of £22,296, and the construction of necessary roads and sewers at

£2,128. A further contract with Messrs. Mollekin & Sons for the erection of 20 houses at Bramley was sealed.

SANDBACH.—The Sandbach U.D.C. is to erect 8 houses at the rear of the Senior Council Schools, at a cost of £3,960. The following tenders were received: Thomas Martin, £513 per house; S. Jackson, Ltd., £473 per house; H. Hilditch, £470 per house; W. Sheet, £469 10s. per house; H. E. Shaw, £466 17s. per house; C. Mellor, £457 per house; G. Edwards Ltd., £450 17s. 6d. per house. The tender of Messrs. George Edwards Ltd., being the lowest, was accepted. Mr. A. Price, surveyor to the Council Council Offices, Sandbach, Ches.

SHEPshed.—The Very Reverend Canon Hobson, The Elms, Shepshed, Loughborough, is proposing to erect a new Church of St. Winefride's at Shepshed. The plans have been prepared by Messrs. Young & Reid, architects, 5 Verulam Buildings, Gray's Inn Road, London, W.C.1. The contract has been placed with Messrs. Atkin Brothers, Ltd., builders and contractors, Shepshed, whose tender, at £7,882, has been accepted from seven tenders submitted. The work is to be commenced forthwith.

ST. HELEN'S.—St. Helen's Corporation have now placed the contract for the erection of 48 non-parlour three-bedroom type houses on the Clock Face housing site, No. L1 and L2. The plans have been prepared by Mr. Arthur W. Bradley, M.Inst.C.E., borough engineer and surveyor, Town Hall, St. Helen's. The contractor is Messrs. Pious A. Baines, builders and contractors, Friarsgate, Wellington Road, Preston. The work has not yet been commenced.

STOCKSBRIDGE.—Subject to the approval of the B.E., the West Riding E.C. have accepted the tender submitted by Messrs. Wade & Sons, builders and contractors, Wath-upon-Deane, near Rotherham, for the erection of a new school at Stocksbridge, near Sheffield, to the plans prepared by the Authority's Architectural Department, County Hall, Wakefield. The work has not yet been commenced.

Trade Catalogues Received

Maw & Co., Ltd., of Jackfield, Ironbridge, in a portfolio of over forty coloured plates, illustrate many interesting schemes in interior tilework. Present-day influences governing the treatment of wall surfaces, particularly in kitchens and bathrooms and in shops of certain trades, have called for greater consideration of this essentially decorative craft, which, until the middle of the last century, was almost forgotten in this country. Many of the schemes illustrated show considerable artistic merit, especially those on plates A20, A26, A41, A42, and A45. The wide range of shapes, angles, mouldings, and skirtings shown in the technical appendix is interesting in showing the many and varied combinations which may conveniently be made to conform with characteristics in shape of almost any individual room.

REINFORCED CONCRETE ENGINEERS

The Kahn System

The New Factory for Wrigley's Products, Ltd., at North Wembley.

Architects: Wallis Gilbert & Partners

Contractors: A. Roberts & Co., Ltd.

Reinforced Concrete Engineers: The Trussed Concrete Steel Co., Ltd.

Mushroom construction for factories.

The advantages of this system over a beam and slab construction are: the complete elimination of depending beams, resulting in a flat ceiling throughout the building with no obstruction to light or air: the absence of any columns in the external walls greatly facilitates the placing of internal fixtures beneath the windows: one hundred per cent. glass area can be obtained, giving the maximum lighting and ventilation: it is more economical than any other form of construction for large areas.

This system is most suited to modern methods of rapid construction—the bays are all of standard size and the centering can be repeated in any part of the building.

**The essence of the design and construction
of mushroom slab buildings is experience.**

Medusa Waterproofing Compound

C. Stucco and Roughcasting. As an example of the adaptability of Medusa Waterproofing Compound we would like to refer to external decorative work in Cement. It will have been noticed on outside stucco work at the ends of window heads and sills, for instance, that the rain running off at these points has left unsightly stains, which are caused by the absorption of moisture containing dirt and impurities taken up from the atmosphere. These stains cannot be disposed of except by painting over or covering in some way, but if Waterproofed Cement is used for the outside work, these disfiguring marks merely remain on the surface and can be removed readily by washing with clean water. In the circumstances, we can say that a Medusa Waterproofed Cement is a stainless Cement, a condition much to be desired especially where White Cement is concerned, and it may therefore be used to great advantage for stucco work and rough-casting, either in backing or finishing coats.

Write for the Medusa Catalogue.

Varnish, copal	17/-	Gallon.
Ditto flat	16/-	Gallon.
Whiting Gilders	3/-	Cwt.

The Ideal Home Exhibition
(Continued)

At Stand No. 22 Messrs. John R. Venning & Co., Ltd., of 32 Victoria Street, S.W.1, who have taken over the sanitary equipment department of Messrs. Mellowes & Co., Ltd., are showing a series of modern bathrooms suitable for various types of dwellings.

Household Water Softeners, working on the "Permutit" system, comprise the exhibit of Messrs. United Softeners, Ltd., of Aldwych House, London, W.C.2 (Stand No. 61). These units work under the ordinary water pressure, and are automatic in action, the only attention required being a periodic regeneration with salt.

Messrs. Major & Co., Ltd., of 205 Borough High Street, S.E.1, have arranged Stand No. 67 in the form of a garden bungalow illustrating the many uses of "Solignum" as a wood preservative and as a decorative stain.

"Alabastine," a permanent water paint and filler, requiring only cold water for mixing, is being exhibited by Messrs. The Alabastine Co. (British) Ltd., of 16 Church Street, S.W.8, at Stand No. 68. This decorative medium is claimed to harden with age and to be fast to light.

Many novel uses for Robbialae Enamel and Robbialae Aluminium paint are to be seen at Stand No. 74, occupied by Messrs. Jensen & Nicholson, Ltd., of Stratford, E.15.

Paints and putty compounds manufactured by Messrs. Cuirass Products, Ltd., of Abbey House, Tothill Street, S.W.1, are being shown at Stand No. 98, where they are demonstrating the waterproofing and heat-resisting qualities of their products.

Stand No. 45, occupied by Messrs. Salubra Wallpapers, of 77 Newman Street, W.1, is divided into sections showing complete decorative schemes, ranging from the simplest of plain effects, through bathroom ideas, to the most elaborate treatments suitable for theatres, etc.

Messrs. Raines & Porter, Ltd., of Tranby Works, Hull (Stand No. 57), are exhibiting "Velmatt" Flat Wall Finish, "Glosilene" Enamel, and other decorative materials.

Stand No. 58 is arranged in the Oriental style to show the decorative features of "Wallpax," the patent wax paint manufactured by Messrs. Samuel Wills & Co., Ltd., of Castle Green, Bristol.

At Stand No. 1 (Ground Floor, New Hall), Messrs. Wm. Duncan Tucker & Sons, Ltd., of Lawrence Road, Tottenham, N.15, exhibit a complete range of their garden frames, suitable for all kinds of garden use. A small ornamental garden house is also shown.

Drytone Ltd., 73 Gower Street, London, W.C.1 (in Stand No. 30), exhibit in a most interesting stand the rich decorative effect produced in a small house by the use of Drytone woodwork throughout. The stand consists of a dining-room, bedroom and kitchen, with appropriate furniture designed and made in the firm's workshops.

At Stand No. 70, Paripan, Ltd., Sherwood House, Piccadilly Circus, exhibit the decorative features of Paripan enamel, glossy and flat, and emphasize its durability and washability.

Duncan Watson & Co., of 61 Berners Street, London, W.1, in Stand No. 90 exhibit some interesting domestic appliances, including electric vacuum cleaners, heavy duty cleaners, and the new model "Apex" electric clothes washer and ironing machines.

At Stand 41 the Empire Stone Co., Ltd., of 231 Strand, London, W.C.2, display Empire Stone garden ornaments.

The Educational Supply Association, at Stand No. 10, demonstrate several very novel arrangements and combinations that can be built up with the units of the "Esavian" Sectional Bookcase.

"Lefco" Ware, a product of the Leeds Fireclay Co., Ltd., of Wortley, Leeds, is displayed in a wide range of garden ornaments and fireplaces. The

same material has been applied to the construction of the stand (No. 94, Main Hall) on which the unglazed garden ware is also shown for those who prefer a textured material which at the same time retains the speckled biscuit-coloured characteristics of "Lefco."

Messrs. The Rawlplug Co., Ltd., of Rawlplug House, Cromwell Road, London, S.W.7 (Stand No. 108), are showing a variety of labour-saving devices, including Rawlplug and Rawlplug bolt anchors.

The Triangular Construction Co., Ltd., East Molesey, Surrey, show on Stand 42 a complete series of "Trianco" products which fully explain the Triangular system of construction.

The exhibit of the Vesta Paint Co., Ltd., 16a, Newman Street, Oxford Street, W. (Stand 65) shows by a display in many common articles the different uses to which this firm's various paints can be put.

Messrs. Hammond Bros. & Champness, Ltd., Alfreton Street, London (Stand 76) show lifts of all descriptions, fitted with every safety device, and also a patented electric service lift for private houses, specially arranged for low current consumption.

The exhibit of the Country Service Association (Stand No. 40) takes the form of a small house completely structurally equipped. The hot water supply, radiators, Cookanheat, etc., by the National Radiator Co., Ltd., Pyropruf roofing by D. Anderson & Sons, Roach Road Works, Old Ford; sanitary fittings by B. Finch & Co., 34 Buckingham Palace Road; and glass by James Clark & Sons, Blackfriars Road, S.E.1.

In the £1,500 Prize House designed by Mr. Gordon Allen, F.R.I.B.A., and also in the "Universal" house, all inside linings were executed by Bell's Poilite and Everite Co., Ltd., Southwark Street, S.E.1; doors by Merchant Trading Co., 34 Bishopsgate, E.C.2; and the hot water supply by the National Radiator Co., 439 Oxford Street, W.1.

The

2-in. Deal strings, per foot super	2/-
Housing steps to strings, each	9d.

"Beauty begins where the
light comes in"

Specify PLATE GLASS for Windows

You are then certain that the Glazing of the house will be in accordance with the rest of your architectural plan, in keeping with the degree of richness, dignity, beauty and desirability you have in mind.

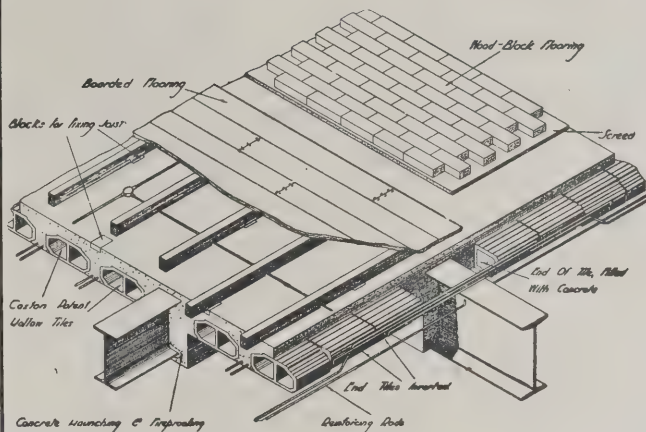

Plate Glass, as the pre-eminent glazing, is being advertised to the public, who are learning to appreciate the value of Plate Glass for the windows of their houses.

Plate Glass is a non-conductor of heat, it is practically sound proof, and less liable to breakage. Its brilliant, polished surface enhances the exterior of a house, and from the interior it gives perfect vision. There are no ugly "wavy" lines or distortion; no detracting from the beauty that comes in — through the window.

"Plate Glass and the Home" is the title of a brochure being widely distributed among the public. A copy will be sent you free and post free on request. Write

On ceilings	1/7	2/5

Estimating

Architect: You will notice that you have to quote for "Vulcanite" roofing.

Estimating Clerk: It certainly costs less, sir, but is it cheaper in the long run?

Architect: Absolutely! Not only is its first cost lower, but my experience proves it to be unequalled for durability.

Estimating Clerk: In that case, sir, I am surprised at its low initial cost.

Architect: I was surprised when I discovered its real value. It is always waterproof—and fireproof too, when covered with sand and gravel or $\frac{1}{2}$ inch of tar macadam. What's more, it remains in first-class condition for longer than anything else I know.

Estimating Clerk: "Vulcanite" then must be a very popular roofing.

Architect: It deserves to be. I for one always advise it. I would stake my reputation on it.

"VULCANITE" roofing is used under the London Building Act and the Bye-laws, etc., of all Borough and Urban District Councils; and is accepted by all the leading Fire Insurance Companies as an Insurance Tariff Roof

We shall be pleased to have your request for our Illustrated Booklet, and to supply detailed drawings and estimates free.

VULCANITE FLAT ROOFING is supplied and fixed only by

"THE PROPERLY-QUALIFIED PRACTITIONER"

We have lifted the above phrase from a certain document, sent to us for publication, recording the decision of two organisations to oppose the passage of the Registration Bill through Parliament. From later information, it would seem that this opposition is not likely to persist, at least in the case of one of these bodies; we have been asked to withdraw the document, and, therefore, withhold it and also the comments we are prepared to make about it. The phrase itself, however, is arresting and intriguing, and one that tempts further examination. What is a properly-qualified practitioner? We do not doubt that this question, put to a hundred professional men, selected at random, would elicit at least fifty widely differing replies. To one of them, it would signify a man who had started on what he would term the bottom rung; who had graduated amid all the hurry and bustle of a modern practice, had learnt all the short cuts of office routine, was stored with a full knowledge of all the devious ways of clients and contractors, and the methods of circumventing them, who thoroughly understood the question of building finance and building development, who in short "knew the price of everything and the value of nothing." On the other hand, we might encounter the individual, the product of unorganised youthful wanderings amid the bygone arts of Continental lands, who has achieved a dreamy æstheticism which finds itself in conflict with most mortals and the normal workings of the marketplace; has retired to some rural fastness to brood over an art which, purged of its fancied vulgarities, he retails for a limited clientele. We would place neither extreme in the category of the properly qualified practitioner.

It has been truthfully said that all the education of normal children, up to the age of fourteen, only teaches them how to learn. From that age, they begin to acquire slowly the truths from which they will sift principles to guide their future existence, and which they will apply later in the careers by which they earn a living. If one continues this train of thought, it is easy to see that the future architect who is plunged too early and too suddenly into complexities of earning a living is likely to have missed an important store in his technical education. Probably, in the more spacious and

leisurely days of the nineteenth century and earlier, principals had the time and the inclination to educate their pupils. At the present day, the majority have neither the one nor the other. We think practically all the most gifted architects of the day would say frankly that they have not time to teach youths the pot hooks of their future profession; that they want young men in the improver stage, that is men who have not only acquired the faculty of learning in the course of their general education, but who have applied that faculty for a considerable time in technical study for their future profession. The advent of scholastic training in architecture was the inevitable outcome of a change, not only in the outlook but in the conditions of the modern architectural world. There are some who still sigh for the vanishing regime of principal and pupil, but we think it was always greatly over-rated. The good schoolmaster, we know, is born and not made; and that dictum applies with equal force in the case of architectural principals. The careless, incapable or indifferent practitioner could teach his pupils nothing of real value; the gifted and capable man, in the close relationship of office life, was prone to impress his own individuality on pupils rather than to develop their own. The principal, whose sole interest in pupils was the premiums he received with them, naturally ruined them. On all counts, therefore, we hold that the impersonal and developing training which our modern architectural schools afford is a very important factor in the early training of the modern architect. And its most vital aspect lies in the field of design. The large canvas which the school affords for the student, in competition with his fellows, to visualise his ideas of palatial architecture, may not have any real relation to the problems with which future practice will confront him, but it means much in the evolution of breadth of mind, and of a capacity for tackling new problems in a new and unaccustomed manner. And the capacity for competent design is the vital part of architecture to-day. Constructional facts are important, the routine of practice is necessary, but, without the gift of fashioning his materials into architectonic forms, the architect has nothing to give that the engineer, or the builder cannot equally well, or better, supply.

Notes and Comments

The Source of Modernism?

Mr. Howard Robertson's paper at the R.I.B.A. on Monday last was a very remarkable effort. The eyes of the British architectural world have been so long centred upon America in recent years that the progress of new ideas and a modern spirit nearer home has escaped general notice. Mr. Yerbury, at the recent Architecture Club meeting, and Mr. Robertson at the R.I.B.A., between them serve to show that the A.A., at all events, is not looking across the Atlantic for inspiration in Modernist ideas. They rather lead us to expect that any decided forward movement towards a 20th century expression for architecture is more likely to come from the Continent, and most probably from France. In that event, it will not be the first, nor, we think, the last, time that our Gallic neighbours and allies have set the key for a world movement in art. The view, which Mr. Yerbury expressed, that while the Americans have solved very successfully the engineering problems arising out of the construction and equipment of sky-scraper buildings, the architectural expression suited to these original structures lags behind, will probably be a shock to many who have come to regard the U.S.A. as the spiritual home of modern architectural art. Yet, as he developed his theme, one was forced to admit that his indictment on most counts was true. The danger to modern American architecture seems to lie in Uncle Jonathan's tendency to sacrifice quality to quantity. Bearing in mind this besetting sin, it is a wonder that the Americans have done so much good work.

Town Planning in the U.S.A.

Mr. Topham Forrest, the Architect to the L.C.C., has been lecturing in his native city of Aberdeen on "Guiding and Guarding the City." He took as his theme the defects which motor traffic had revealed in the haphazard planning of most cities, and the necessity for the gradual carrying out of comprehensive and well-devised schemes of replanning. In the course of his paper he paid particular tribute to the zoning laws obtaining in the U.S.A., and to the segregation of the business, manufacturing, and residential districts. It was now impossible in New York for a man to develop a piece of property in a manner that would injure his neighbours or the district. Apart from the destruction of amenities, there is no doubt that the local authorities, and behind them the ratepayers, have very sound reasons for a stricter control over building development. The erection of a factory in a residential district may necessitate putting down very strong roads to sustain heavier traffic than a residential district. It may lead to road-widening schemes, increased lighting and scavenging costs, all of which will fall heavily upon the very ratepayers whose amenities have actually been destroyed. The United States has been the first to perceive that while in sparsely populated districts the property owner can be given a fairly free hand, in the cities individuality in development may become a serious nuisance, if not a positive outrage.

Whistlers

Mr. Walter Sickert, A.R.A., has sounded a warning in *The Times* about a number of forged Whistlers that have appeared on the market in recent years, and of the greater number that may be expected to appear if collectors do not take precautions against being imposed upon. Mr. Sickert is an authority

upon Whistler's work, having been an intimate friend of the great artist, and his warning is not one to be disregarded. The fact that "Whistlers" are worth faking rather suggests that that painter has now reached the status of an old master, since the forger is not given, as a rule, to troubling about the lesser lights. The fact that few people know much about Whistler's work, or about his output, probably conduces to the success of the forger's efforts.

London Squares

A bill, entitled the London Squares (Preservation) Bill, has been presented to Parliament by Mr. John Scurr, M.P., having for its object the sterilization from building of all garden squares which have been set apart for the use and enjoyment of the inhabitants for a period of 25 years ending December 31 last. The Bill would prevent owners from building on the garden squares without the consent of the London County Council or (in the City) the City Corporation, who are empowered, where consent to building is desired, to exact concessions in other directions. The Bill has influential backing among all parties. The rather widely held view that all gardens in the squares should be thrown open to the public, without regard to the rights of the inhabitants who pay for their upkeep, and pretty heavily in rent for the amenities afforded, is not one that we can endorse. The square garden is, in the majority of cases, the only garden space for perhaps a score or more of houses, whose occupants are as much entitled to its sole use as any occupier of a private garden in the suburbs.

The Countryside

Bridges and roads have been the principal topics of *Times* correspondents during the past week. Mr. Pitman's enquiry about the proposed new Thames Bridges, and their effect on river traffic and boat racing, to which we alluded last week, seems to voice a possible defect that has already been considered and provided for. Further afield, the proposed rebuilding of Abingdon Bridge and Culham Bridge has brought a protest and counter suggestions from the Society for the Protection of Ancient Buildings; and there seem to be no very clear or insistent reasons for the radical measures proposed in regard to these structures, except the usual and inevitable theory that no bridge can be too wide and no road too straight in these days, when the motor car looms as the most important factor in our existence. The straightness of the new roads, and the ruthless straightening of old one, as offerings to our new ruling deity, are drawing an unusual crop of complaints from country residents, many of whom are motorists, but not all of whom are impressed by the apparent desire to sacrifice everything to speed. We foresee that the C.P.R.E. is going to find its hands full.

Destruction of a Landmark

"Bransty Arches," a massive structure spanning one of the principal streets of Whitehaven, has been demolished as constituting a danger to present-day traffic. It was erected in 1790 for the purpose of a road to carry coal from the pits of the Lowther family on the north-east side of the town to the harbour; but these pits ceased to be worked some 70 years ago. A petition, signed by some 4,000 local residents, protesting against the destruction of this landmark, was presented to the Town Council, but without avail.

THE MEMORIAL CHAPEL, JERUSALEM.
SIR JOHN BURNET, R.A., AND PARTNERS, Architects. GILBERT BAYES, Sculptor.

A MEMORIAL ON THE MOUNT OF OLIVES

The memorial to the "missing" of the Egyptian Expeditionary Force, which is to be unveiled on May 7 by Field-Marshal Viscount Allenby, will probably be considered the crowning achievement of the Imperial War Graves Commission, for which so many distinguished architects have worked. In the memorial, Sir John Burnet, R.A., who also designed the cemetery itself, has given a dignified yet essentially simple composition, and together with his sculptor, Mr. Gilbert Bayes, has produced a distinctly fine work. The above illustration shows the memorial chapel, a domed building forty feet high, rising from a low platform. The approach is made by a broad flight of steps, at the top of which is put a simple monolith, the "Stone of Remembrance." A bronze figure of Saint George stands in an arched opening leading to the bronze entrance doors, surmounted by the Imperial Arms, and the following inscription carved on the stone:

This Memorial Chapel was erected by the Officers, Non-Commissioned Officers, and Men of the Egyptian Expeditionary Force to the Honoured Memory of their Comrades who fell in the Palestine Campaign, 1914-1918.

"We therefore remember you in our prayers as it becometh us to think upon our brethren."—Macc. I., xii., xi.

The chapel is flanked on either side by stone walls fifteen feet in height, and terminated by stone pylons twenty-two feet in height, one bearing the arms of Australia and the other those of New

Zealand. Panels the fixed on these curtain walls displaying the names of the 3,385 "missing" of the Egyptian Expeditionary Force.

The interior of the chapel has been decorated in mosaic, the gift of the New Zealand Government, and designed by Anning Bell, R.A., with symbolical figures representing the spirit of Victory and the spirit of Peace. The former bears the laurel and the latter the olive branch. On either side of them, on the side walls, are other winged figures kneeling in prayer, and emblematic of Aspiration and Hope.

The whole is a noble and impressive monument, equally worthy of the sacred purpose it serves and of the hallowed associations of the district in which it has been built.

Haddon Hall, which has been unoccupied for over 200 years, will again become the principal seat of the Rutland family when the Duke takes up his residence there at the beginning of next month. The famous old mansion has been undergoing an extensive re-fitting and process of modernising during the past year for the purpose.

As it had been proposed to remove two ancient coffins of stone and lead respectively, found under a stable which is to be converted back to its original condition as part of the Cloisters of St. Bartholomew the Great, Smithfield, the Rector has appealed to the Lord Mayor of London to use his influence to ensure that they should remain where they had lain for centuries.

"MODERN FRENCH ARCHITECTURE"

Extracts from Mr. Howard Robertson's Paper at the R.I.B.A.

Some people are thrilled by the very sound of the word modern, but to others it only suggests a term of opprobrium. I am reminded of an article by Paul Géraudy on the Paris Exhibition, in which he describes the absurdities of past exhibitions, the bedrooms which forbade sleep, and the dining-rooms which took away one's appetite, all the trivial and terrible things which were grouped under the heading of "modern movement." "And so," says Géraudy, "the word *modern*, even for those who are most favourably disposed towards the idea for which it stands, has gained such an evil reputation that artists are asking for a new label." "Perhaps," he goes on, "they are right in doing so. Not long ago, one of my friends was asked to act as member of an exhibition jury, to which only *modern* works were to be admitted, and found to his surprise that exhibits were being accepted or rejected absolutely without method or principle. Finally, in despair, he enquired of the chairman of the committee by what signs one recognised whether a work of art was modern. "You can always recognise modern work," replied the chairman, "by the fact that it looks like nothing on earth."

There is, however, to-day, as Paul Géraudy goes on to say, a modern style which is well disciplined, and which certainly does look like something. It reflects ourselves. It is in no sense inimical to our traditions. It corresponds with our present-day customs and habits. It satisfies our needs. It reflects our mentality and our culture. It is modern in the same sense that we ourselves are modern: it is alive.

That seems to be a very vivid and truthful definition of what is understood by "modern" architecture in its best sense. Before, however, attempting to give an outline of the contribution of French architects towards the modern style, I would like to quote another opinion, that of Monsieur Léon Jaussely, Government architect, Professor at the Ecole des Beaux-Arts, and practitioner of talent, on whom devolved the stimulating task of speaking at the Congress on French architectural education in the future.

"Whatever opinion we may hold of the present evolution of architecture," says Monsieur Jaussely, "it is undeniable that this evolution does exist, and that we are at present witnessing conscious or unconscious attempts to renew architectural forms and æsthetics. This renewal is more particularly noticeable in important buildings—large stores, bridges, churches, banks, cinemas, railway stations, airship sheds, etc., which we can consider as the expression of the monumental architecture of our time, and which logically should be compared with that of other epochs in order to understand the meanings of this architectural transfiguration." Mr. Jaussely then passes on to the question of the new æsthetics, in which horizontal lines predominate, curves are more and more avoided, contrast between vertical and horizontal is universal. These new æsthetics are further characterised by the simplification of the articulation and its reduction to a small number of elements, the search for enveloping form, and general colour in place of detailed moulding; points of decoration are sought for their contrast value, but are sparsely distributed and stand out against a bare background; the appreciation of volume and masses is exact; the outlines are severe. The sobriety of these æsthetics exclude all mannerism.

"Let us recapitulate: simple composition and lines, of a real and severe classicism, but with different

and reverse proportions; sober architectural treatment, the facing materials are rich, even precious—or appearing such. . . . Particularly successful as modern works must be considered these engineering works of great frankness where the very striking appearance is due to the effect produced by combinations of purely constructive forms without any ornament."

By this admirable summary of modern tendencies, Monsieur Jaussely has saved me from the task of defining the characteristics of the latest French work of the modern school, but it must be realised that, while an architecture of this modern type is being evolved in France by a certain section of architects, there is also a considerable group which has not departed from, I will not say the classic tradition, but from what is known familiarly as the "pompiers." The façades of the Grand Palais in the Champs Elysées, whatever fine qualities they may have, provide an excellent example of the "pompiers." Even the Petit Palais, in certain aspects, is the product of the academic formula.

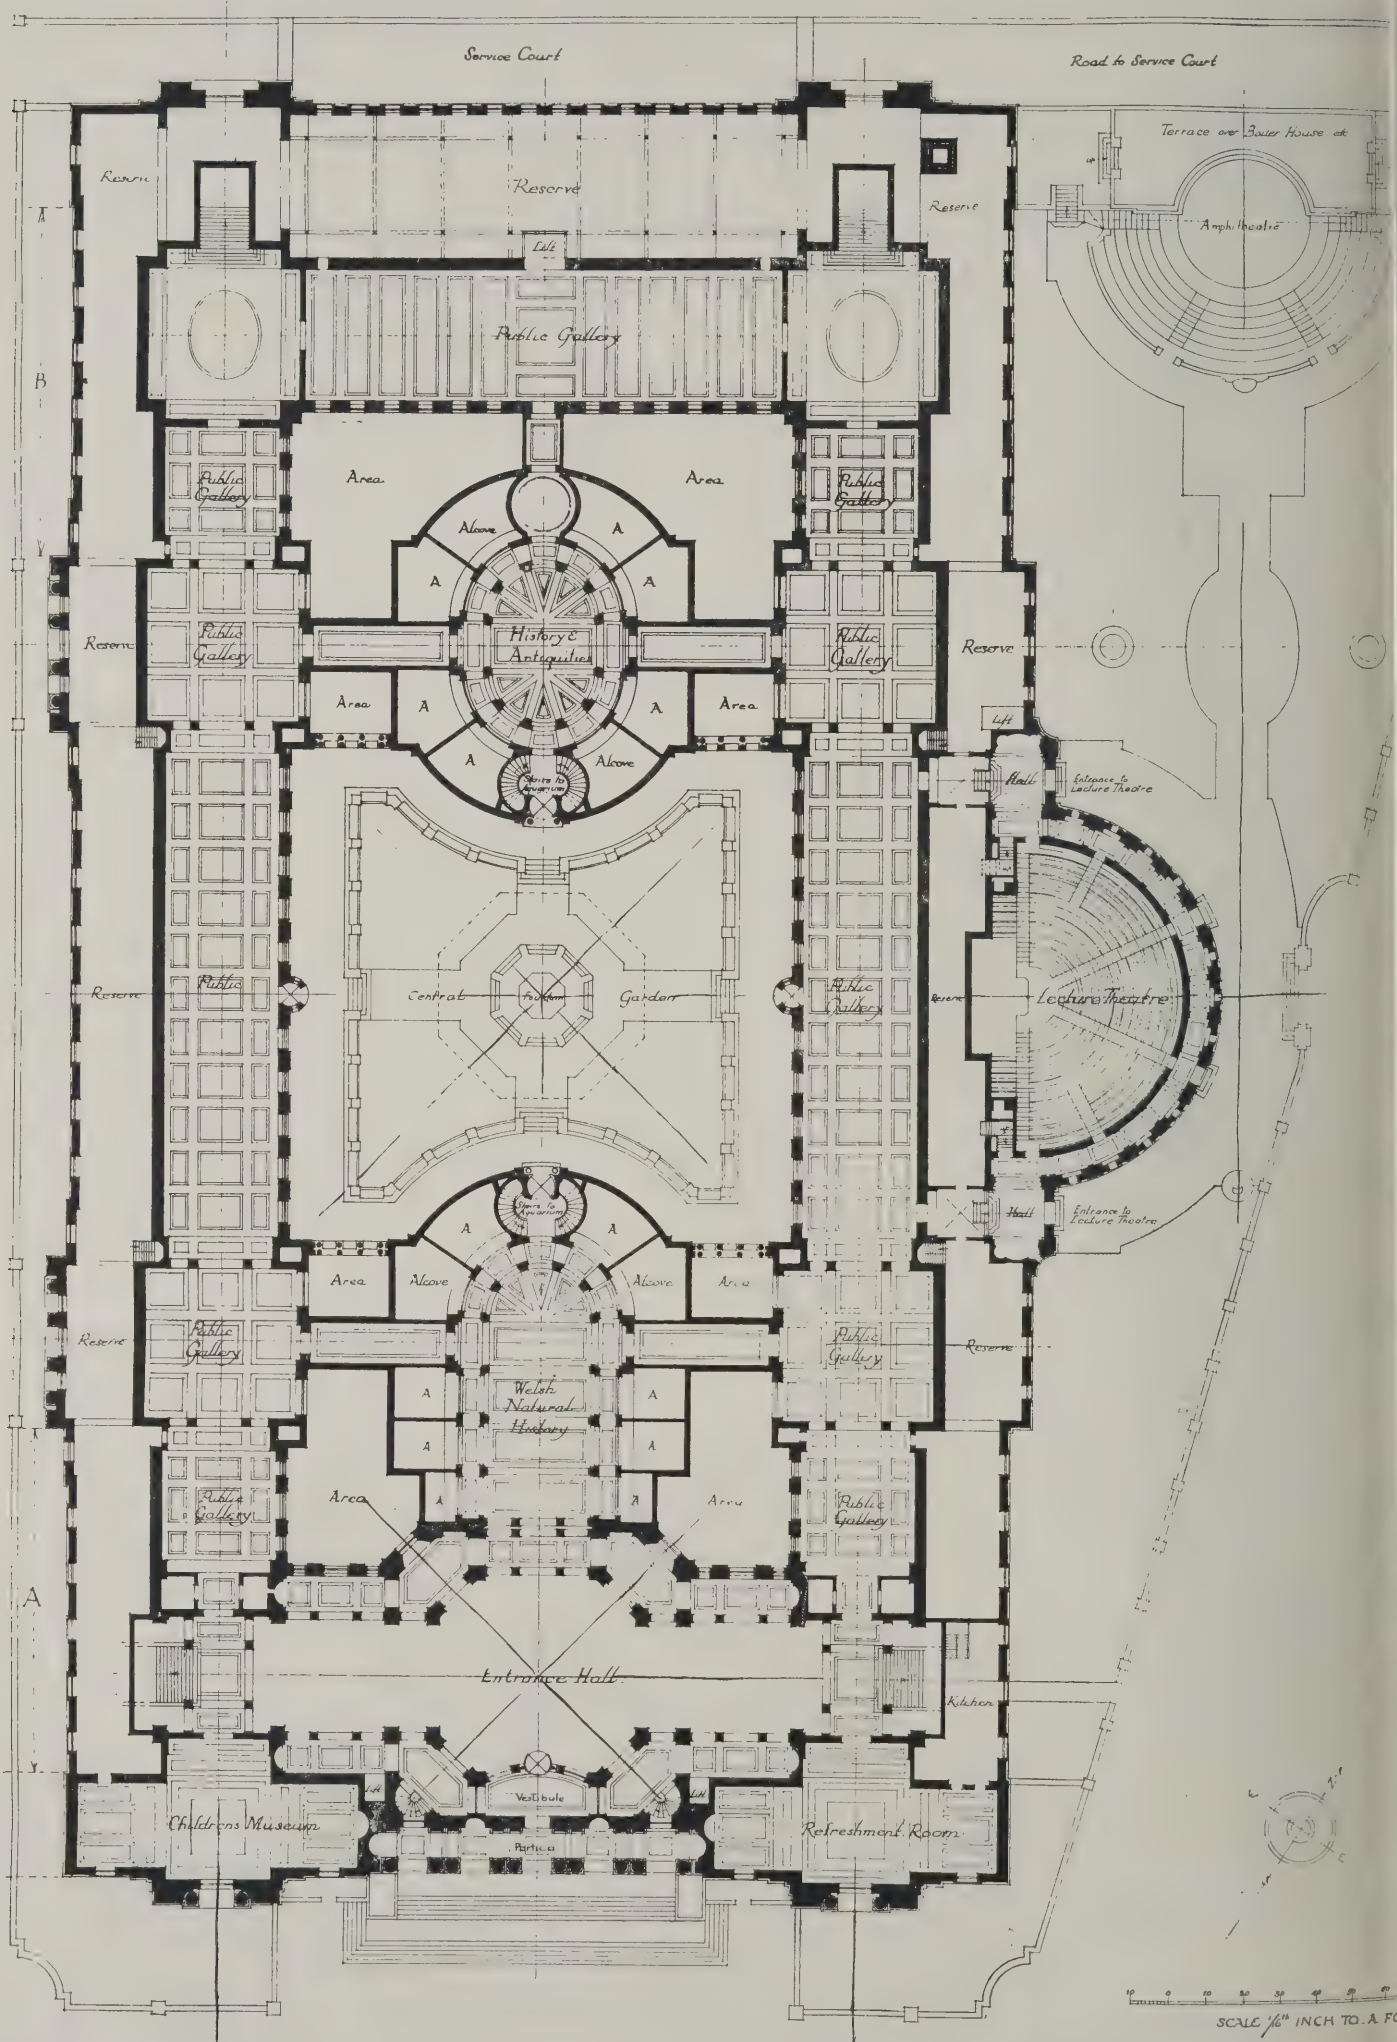

As a point of departure from which to consider modern French architecture, I would like to go back fifty years, and illustrate a building which to my mind embodies to an extraordinary degree the virtues and vices which have been peculiar to French architecture, and for both of which the tradition of teaching at the French National School has been very largely responsible. That building is the Paris Opéra House, by Charles Garnier, completed in 1875.

The Opéra House is a striking example of the working of a marvellously efficient architectural formula, the formula of fine plan production, one which has been handed down from generation to generation of French teaching. The plan heralds the beginnings of a war between the old-fashioned plan forms of solid masses and the lighter shapes which would logically result from modern methods of construction.

The resultant elevational architecture, produced in faithful obedience to the formulæ for composition in the grand manner, is nevertheless devoid of real vitality. It achieves the limit of what can be produced by sheer technique, both in method of organising plan form and in the production of elevational character, by the sheer dogged application of the rules of logic. I have called the Opéra a masterpiece. It is perhaps rather a *tour de force*. It is also a veritable dictionary of decorative motifs, and nearly all of them are bad! Let me quote from that most interesting publication of the French modernists, "l'esprit Nouveau."

"It (the Opéra) is an external architecture. It can only herald decadence. . . . That is why the younger generation has categorically rejected the legacy of Garnier. Architecture is organically constructed from the inside outwards, and this does not apply only to its solids, but to its spirit. There is nothing to inherit from Garnier: one acknowledges the enormous effort of this man, an admiration which is not far removed from the distrust which one instinctively has of a magician. . . . On the whole, one may say that the Gothic movement was healthy and reassuring. But the Garnier phase represents a kind of funereal pomp. The undertaker . . . flowers . . . visits to the cemetery. A period which for us is quite dead. And yet, in itself, the auditorium of the Opéra is superb."

Here is a criticism and a tribute. It is one which could apply with variants to many buildings which, since the Opéra was built, are typical of the earnest

THE NATIONAL MUSEUM OF WALES: GROUND AN

SMITH & BREWER, Architects.

endeavour to modify and adapt the old solid architecture of the grand manner to the innovations of modern steel construction.

As long ago as 1860 Viollet le Duc was prophesying the advent of a new architecture dominated by steel and iron, and Labrouste was applying the new methods to the Library of Sainte-Geneviève, and to the reading-room in the Bibliothèque Nationale. The earlier efforts in France, as elsewhere, are full of compromises. The Grand Palais is competent, but it is a hybrid. So also is the Gare d'Orsay, a building which depends on steel but which parades an immense ponderous façade belying the airy grace of the metal vaults within. In the same category is the Pont Alexandre, built for the 1900 exhibition, an engineering structure decorated by architects. All these have merits, but can lay no claim to indicating a solution.

More interesting and sincere, but marred by the triviality of its detail, is the Magasin de la Samaritaine, where the steel skeleton receives a frank adornment. Here the mistake lies in the emphasis of the detail of structure rather than in the expression of its spirit. It is graceful strength of form that one hopes to see expressed, rather than the bones and vetebræ, however skilfully adorned.

At this stage in the modern French movement begin the experiments and heart-searchings which are still the order of the day for the many who refuse the solace of complacency. We find various lines of approaching the difficult problem of a modern architectural expression, the two main alternatives being, first, the expression of the modern construction and materials, and, secondly, a more abstract implication and suggestion of modern purpose, not so much through direct expression as by character of form and that general atmosphere to which detail and decoration so largely contribute.

Before the war experiment was going on, originators were at work. But since the war, greater recognition has been accorded to the pioneers, and more designers have joined their ranks.

Amongst the small and distinguished band who will ultimately be entitled to claim a niche in modern architectural history I would like particularly to mention the brothers Perret. Their work constitutes, in my opinion, probably the most important individual step in modern development of the past fifty years, not so much from the standpoint of buildings erected as from that of experiment and inspiration.

The Perrets, architects and builders both, trained in the Ecole des Beaux-Arts and in the school of a varied practice, are doubly qualified; but in addition they have the precious gift of imagination, and are applying it to the study of the most significant of building materials, reinforced concrete.

The Perrets' theories are quite clear. They understand the material, its possibilities, and its limitations. They see the future of reinforced concrete, not as massive precast blocks or in heavy plastic shapes, but as structural posts and ribs, placed, like Gothic piers, at the point of load, and, like them, permitting the lightest screens or infillings between them.

This is the system of their earliest best known work, the Champs Elysées Theatre, the plan of which is so expressive of a modern light construction. Expressive, too, is the façade with its application of marble slabs, a veneer construction both legitimate and honest. And here, too, is true sculpture applied to architecture in the three great panels of Bourdelle.

But the best contributions of the Perrets are their churches at Le Raincy and Montmagny, and the observation tower which they have built at Grenoble, all in concrete and tremendously expressive.

The Perrets designed the theatre at the Paris Exhibition with the triple stages which were never used.

We have now arrived at mention of this exhibition, already so familiar. Its importance was not in the main architectural; temporary buildings, unless true to their very nature, cannot make serious contribution to progress in permanent building, either in construction or expression, two things which are really one. The exhibition showed, in architecture, a general desire first to emphasise the geometrical solids which constitute building forms, and then decorate them with an appropriate surface treatment. It showed the desire to explore modern technique in materials. It expressed itself in wide openings and spans, light and effortless construction, cantilevering and even suspension, and, in detail, in the craftsmanship of metal and glass. Those who, like Le Corbusier, blame the exhibition for neglecting the more serious problems of standardisation and the economic dwelling are scarcely just.

The exhibition was only a demonstration to mark a stage in the modern forward movement. The impress of Munich or Austria, or the Orient, or Paul Poiret, do not affect the main issue, the fact that the modern movement was already in being long before the exhibition and in some form or other will most certainly continue, for this modern movement has a background of over three thousand years.

In monumental buildings there has certainly been a dearth of opportunity, but in commercial work the modern spirit has several triumphs to its credit. The new annex to the Bon Marché has that suave beauty of plan form which, in new work as well as old, seems instinctive with the French. Its exterior is both sensible and dignified, and charmingly detailed. The interior escapes the two extremes of our own commercial architecture, smugness or coarseness, and is obviously the work of artists who are craftsmen, and *vice versa*.

The French apartment house has developed no typical expression. It is in private work that we find the greatest variety of architectural experiment. From the semi-traditional we pass to the semi-functional, and from that to the temperamental. But these are the dwellings of the more luxurious type, and there still remains another striking French development, that of the economic dwelling, as exemplified by the work of such men as Le Corbusier and Jeanneret, André Lurçat, and a small group of their contemporaries.

At the Paris Exhibition, the Pavilion by Le Corbusier and Jeanneret for that group of modernists calling themselves "L'Esprit Nouveau" contained the nucleus of the standard dwelling unit to be built either detached or in multiple groups, on a sort of cellular system. In an apartment house built on this scheme each dwelling would have its own open-air garden, two storeys high, and ventilated by a continuous air shaft.

On a broader basis still, Le Corbusier foresees the reconstruction of cities with huge blocks of tall buildings, sort of gigantic service flats, surrounded by wide open spaces, and served by broad arteries at different levels. The ill-planned and congested city is to be grouped in orderly units surrounded by light and air.

In their private work Le Corbusier and Jeanneret put their theories into practice. Their houses have been illustrated in our English publications, and they all show the same outstanding features, namely, standardised column spacing, standardised window and door openings and fittings, a structure of concrete framing with a light infilling, and, most important of all, the flat roof.

In some of these houses, the garden in a sense flows under the building and even over it, for Le Corbusier sees no reason why every house should not have its roof garden and flower-boxes. For him the sloping roof is doomed.

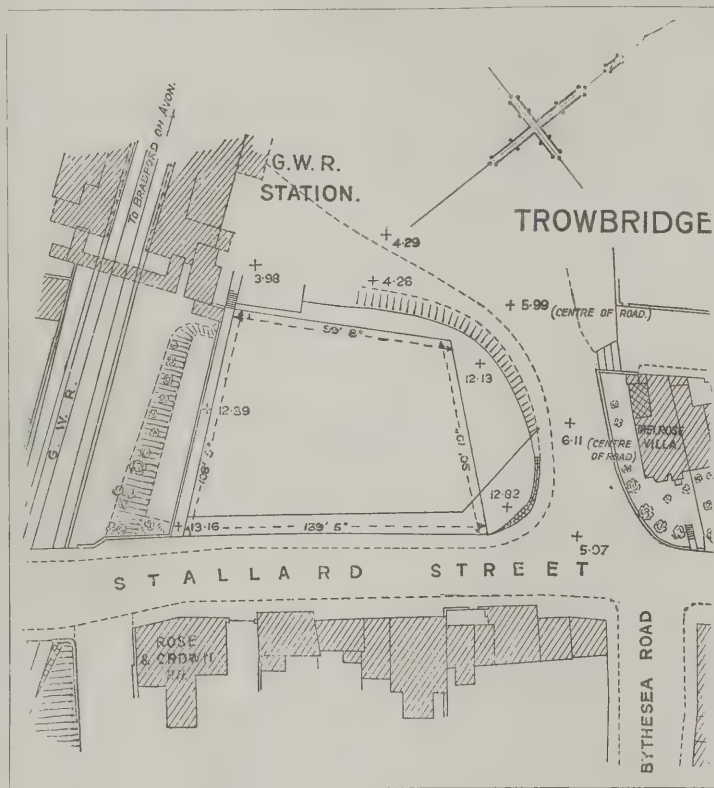

A COMPETITION FOR THE NEW OFFICES OF A WILTSHIRE BENEFIT SOCIETY

The Wiltshire Working Men's Conservative Benefit Society, as announced in a recent issue, invite architects to submit designs in competition for new offices proposed to be erected on a site in Stallard Street, Trowbridge, Wiltshire. Mr. Cyril A. Farey, A.R.I.B.A., and Mr. Robert Lowry, F.R.I.B.A., of 7 Bedford Square, London, W.C.1, are the assessors. The following premiums are offered: £150, £70, and £30 respectively. The design of each competitor is to be contained in one package and to be sent in addressed to the Chief Secretary, Wiltshire Working Men's Conservative Benefit Society, Trowbridge, Wilts, and endorsed "Design for W.W.M.C.B.S.," not later than April 12, 1927, after which no design will be received. A plan of the site is supplied with the conditions and instructions; this plan clearly shows the levels of the ground. Electricity, water, and gas are available from mains in Stallard Street, and there are two sewers, the main one being 16 to 17 ft. deep and the subsidiary sewer 4 to 5 ft. deep. The drawings must be accompanied by a concise type-written description of the buildings, explaining their construction, finish, and the materials proposed to be used, and giving such information as cannot be clearly shown on the drawings. An estimate of the cost must also be sent, based on the cubic contents of the buildings measured from the top of the concrete foundations to half-way up the roofs, or two feet above flats. The rate allowed per footcube is to be stated. Access is only available from Stallard Street, and it is desirable to allow parking accommodation for motor cars on the site, easily accessible from this street.

The following accommodation is required:—Basement: Stationery stores room, say 200 ft. super.; lavatories, M. and F. (staff), say 160 ft. super.; wash basins (2), w.c.'s (2), say 80 ft. super.; additional lavatory, say 60 ft. super.; strong room, say 140 ft. super.; space for deed safes, say 140 ft. super.; boiler house, etc., for central heating, coals, etc., say 275 ft. super.; total, 1,055 ft. super. Ground floor: Large main office with accommodation for 50 clerks, divided by means of wood and glass partitions. (Note.—The whole office to be capable of supervision from any point therein.) Assistant secretary's office, say 180 ft. super. Chief secretary's private office, say 300 ft. super.; total, 3,640 ft. super. First floor: Board room (45 persons), say 1,050 ft. super.; committee room (15 persons) say 400 ft. super.; lavatory or lavatories and cloaks, say 420 ft. super.; caretaker's quarters, four rooms, w.c. and bath, say 750 ft. super.; total, 2,620 ft. super.

Although it is desirable to adhere as far as possible to the above schedule of accommodation, it is not intended to restrict freedom in planning, and competitors may modify the suggested allocation of rooms on different floor levels if by so doing they can produce greater efficiency in plan. The following drawings are to be submitted: Scale 32 ft. to 1 in., block plan showing the disposition of the building on the site with drainage lines; scale 8 ft. to 1 in., plans of all floors, four elevations, two sections; scale 2 ft. to 1 in., detail showing a portion of the principal front. Drawings to be in pencil line, the windows being shown in black or dark grey, the walls of the plans and sections being in black. No perspectives will be admitted.

These conditions are formulated with great exactitude, and competitors are relieved of the responsibility of deciding which apartments are to be placed on the ground and first floors respectively. The relation of first floor area to that of the ground floor, roughly about two to three, suggests that a certain proportion of the first floor rooms may be placed within the roof, either a mansard, gabled or hipped roof, whichever accords best with the neighbouring architecture. The building line towards Stallard Street is approximately level, and there appears no reason why the main façade of the new building should not be parallel to the existing frontages of

the "Rose and Crown" Inn and the houses adjacent to it. Obviously the building will only cover a fraction of the site, so it might be advisable to put questions to the assessors with regard to the manner in which the adjacent ground, apart from the parking space which is specified, can be suitably disposed, whether as gardens, lawns or plantation of shrubs. If the whole of the area unoccupied by the building is to be given over to parking space, this should be definitely ascertained, for it will affect the planning of the rooms to an important extent, inasmuch as it will then be necessary to take special pains to make the maximum number of rooms face away from the parking space, which is sure to be somewhat noisy.

There appears to be no particular apartment of the building more worthy of expression than any other, unless it be the board room, which, however, is too small in area to become the dominant composition. These circumstances point to the desirability of a simple design of modern type, with repetitive fenestration, but due consideration must be given to maintaining the character of the architecture in the locality.

THE TWENTIETH CENTURY HOUSE

X.—An Urban Dwelling for a Large Family

By A. TRYSTAN EDWARDS.

It may be worth while to illustrate a few new types of the small house, which in some respects represent a departure from the standard plans evolved during the last twenty-five years. By the term small house I mean a dwelling inhabited by people of restricted means who cannot afford to keep servants, and one which provides the very minimum accommodation considered requisite for families of various sizes. As our civilisation advances this minimum will, of course, continually expand, and if we may assume that the general standard of life will improve, it is desirable for architects to prepare in advance for this new standard. I may begin by presenting a plan of a house suitable for the needs of a large family. Let us consider the case of an English family of a type which happily still exists, consisting of a father and mother who married very young and now have six healthy children ranging from the ages of, say, eighteen downwards. Let us assume that the father is earning a decent income and is able to clothe and feed his family in comfort, and could further afford to rent a house with a parlour, kitchen and five bedrooms. Where is he to live? Where can he find a house which satisfies his minimum requirements? The answer is, of course, that such a man, a citizen deserving especially well of the State, will at the present time have exceedingly great difficulty in finding suitable accommodation.

Let us examine the plan shown in Fig. 39, in which I have tried to satisfy the needs of such a tenant. I have assumed that he desires to live in an urban environment (where land is unfortunately rather expensive), and wants a respectable house with no "nonsense" about its design. Economy is, of course, demanded, but not at the cost of health and convenience. I am assuming that on a building estate there is room for a terrace of such houses. There is no need to stress the obvious fact that it will

be cheaper to build the houses in continuous formation than detached or semi-detached. As in the last article illustrating the much larger house, I may enumerate some of the points in the plan and elevations which are perhaps especially worth discussion.

In order to economise in the land occupied by the houses their frontage is practically on the road, the wall being separated from the pavement by only 4 feet, the depth of the porch. This is, however, quite sufficient to prevent people from peering into the windows; while, of course, the living-room facing the street could, if necessary, be further protected from intrusion by the provision of curtains across the lower part of the windows. On occasion, however, an immediate view of the street is an attraction to urban dwellers. It may be assumed that a small stone kerb will bound the side of the pavement adjacent to the house, and would be separated from it by a small strip of grass. From the point of view of hygiene, it is far more important that the house should have a broad frontage, which allows of good ventilation to the rooms, than that it should have a very wide space at the rear between its back elevation and that of the house opposite it. In this instance the frontage is 38 feet, so that even if the garden were only 20 feet deep, giving a width of 40 feet between the two opposite buildings, plenty of sun-

light would enter the rooms on the garden side. In a street going east and west, a reference to the sunlight graph shows that at the Equinox the rear of the houses would on an unclouded day have nearly twelve hours' sunlight, and the front elevation just as much if the width of the road were also not less than 40 feet.

While giving to the house the broad frontage of 38 feet, which increases the cost of street works per house, a compensating economy has been effected by abolishing the necessity for providing "secondary" access, which usually

Fig. 39.

Fig. 38

takes the form of a back road 8 feet wide. This has been accomplished by putting the "back" door on the street frontage, so that coal and tradesmen's goods can come in direct from the street. In old-fashioned streets the secondary access was obtained by the basement steps, but in the present instance the disadvantages of the basement solution have been avoided, while the convenience of its double entrance from the street has been retained. It would, of course, have alternately been possible to adopt the device of a tunnel through the ground-floor storey, such as is often employed to give secondary access in the case of groups of four cottages. But this has the disadvantage that two houses are sharing one back passage, while valuable space is sacrificed on the ground floor. In Fig. 39 it will be observed that through passage to the garden is provided through the lavatory. In this particular house it is assumed that no servants are kept. Space has been found for a motor bicycle near the back entrance. If necessary this bicycle can be wheeled into the garden through the lavatory without being taken through any of the living-rooms.

The entrance hall and parlour are separated from the "working" part of the house. Cooking would normally take place in the kitchen scullery, so that there would be two sitting-rooms available, but a second range in the living-room has been shown. The short passage on the ground floor is the means of giving access to several cupboards and is thus utilised to the full. By opening the back door and lavatory and garden doors through ventilation is secured, while on the first floor the closet and bathroom are cross-ventilated by a passage which not only lights and ventilates the little stretch of corridor leading to the stairs, but also "earns its living" by being the only means of access to bathroom, one bedroom and two cupboards.

With regard to aspect, as has previously been mentioned, the best orientation of the street would be east to west; but if the street frontage faced north, the majority of the rooms would have a south aspect. The most important point, however, is that it is a roomy house with plenty of windows and ventilation, and in this instance

nothing would be gained by sacrificing the economy and conveniences of the plan to considerations of aspect. If the garden front faced south it might be worth while to move the larder to where the coal store is now, ventilating it by a small window under the portico; while a coal store could be placed the other side of the passage, stealing a foot or two from the living-room for this purpose.

The elevations are simple and orderly, a repetitive design being shown on both back and front. It will be observed that there is only one chimney stack to each house, and this is placed centrally between the porticoes. In these latter the front door is differentiated from the "back" door by being made slightly more ornate. It would have been just as easy to have placed this secondary access at the other side of the living-room, but such a treatment would have the objection that the "back" door of one house would be adjacent to the front door of the next, and this would have created confusion. As it is, the portico conveniently groups both doors belonging to a single house. At the rear of the house an attempt has been made, without the use of a recess, to make a decorous pattern of the fenestration. Owing to the slight projection over one part of the façade it has been found possible to place the ventilating pipe at the corner, where it is inconspicuous, while the closet and larder windows are given the same vertical dimension as the others and so pass unnoticed. A suggestion of trellis work is shown, and this helps to differentiate the garden elevation from the street front. In this case there appears to be no reason why the pattern of the trellis should not be individual to each house.

This house is intended to be an example of a large family dwelling planned for economy and convenience. While large cupboards are provided, and a little spare corridor space for cloaks, bicycles, pram, etc., on the ground floor (nearly always necessary where a family of seven or eight people occupy the same house), the rooms are not planned on an extravagant scale, the living-room being 15 ft. by 10 ft., the parlour 15 ft. by 12 ft., while the bedrooms, with the exception of those immediately over these two rooms, are of quite modest dimensions.

Correspondence

Structural Remains of Early London

SIR,—The Committee in charge of the Guildhall Museum are anxious to enlist the help of architects whose practice may include work in the City, with a view to identifying and recording the structural remains of early London (more particularly Roman London) as they are brought to light by excavations. The Council of the Society of Antiquaries and the authorities of the British Museum and the London Museum have kindly promised to give all possible assistance in this direction, and I am instructed by my Committee to ask if you will render valuable aid by giving this letter publicity in your journal. It is intended to establish here a system for the registration of all authenticated discoveries as they occur. The Committee realise that under present-day conditions there is often great difficulty in delaying for more than a brief period work which must necessarily destroy, in most cases, earlier sub-structures. Accordingly, arrangements have been made which will enable detailed measurements to be taken, within a short space of time, of any remains of historical importance. Any communication on this subject addressed to me here will receive immediate attention.

I am, Sir, your obedient servant,

(Signed) J. L. DOUTHWAITE.

Librarian and Curator.

Guildhall Library, London, E.C.2.

February 8, 1927.

Architectural Staff Salaries

SIR,—The part played by my Association in the endeavour to obtain fairer terms of remuneration and an improved status for the salaried architect is well known, and its claim for recognition of a basic minimum salary is even now before the Council of the R.I.B.A. Whilst the recognition by practitioners and certain public companies and corporations of the pressing need for such a minimum is becoming more generally accepted, there is a small but influential minority who steadily block the way. Like many such minorities, it forgets nothing and learns nothing. This minority in the profession has so far offered no valid reason to support their opposition. Sometimes it volunteers an excuse for delay upon the grounds that the operation of minimum salaries would mean a weekly financial loss to the assistant. How that is possible only those who make the excuse can show. It will certainly not be apparent to the greater number of assistants who earn less than £5 10s. per week. As for that smaller number who earn more, they already know that if the basic minimum salary is recognised, their own experience and ability will correspondingly ensure them an increase in remuneration.

Private practitioners are as a rule extremely modest in publicly advertising the salaries offered and paid to their staffs. From the information possessed by my Association on the subject, I am not at all surprised that this is so. Your readers, however, may be assured that the notices inserted by public bodies in need of assistants where a salary is almost invariably stated reflect fairly accurately the average of the salaries being paid by practitioners in the locality. Some light is shed upon the salaries being paid in Devon and Cornwall by the recent notice of a vacancy for a draughtsman at a commencing salary of £130 per annum, from which a deduction of 5 per cent. is made for superannuation. The Devon County Council by publicly stating the value it places on professional services need not fear that it stands alone in offering such terms. On the contrary, it is known that the above salary is offered and paid by private practi-

tioners in both Devon and Cornwall, not excepting towns such as Plymouth and Exeter.

A shocking disclosure such as this may produce a good effect in opening the eyes of many architects to the fact that falling salaries will not of themselves reach a minimum, and that if a barrier is to be erected against the exploitation of the assistant by any class of employer, that barrier must be minimum salaries as agreed upon and recognised by the R.I.B.A. and the A.A.S.T.A. Further inaction is unpardonable, and must result in the hardening of opinion that a certain small section of the profession only is to reap the benefit of organisation and professional protection. I may add that my Association has already lodged a protest with the Devon County Council.

Yours faithfully,

JOHN MITCHELL.

General Secretary, Association of Architects,
Surveyors and Technical Assistants.

Professional Societies

The Royal Institute of British Architects

The following notes are taken from the minutes of a recent Council meeting.

BRITISH ARCHITECTS' CONFERENCE, 1927.—It was decided that the Conference should be held in London from June 20 to June 25 inclusive.

THE FOUNDLING HOSPITAL SITE.—It was decided to accede to the request of the London Society that the name of the Royal Institute should be printed, in the usual manner with the other societies, on the back of the whip which is being issued to Members of Parliament in connection with the opposition to the Bill for removing Covent Garden Market to the Foundling Hospital site.

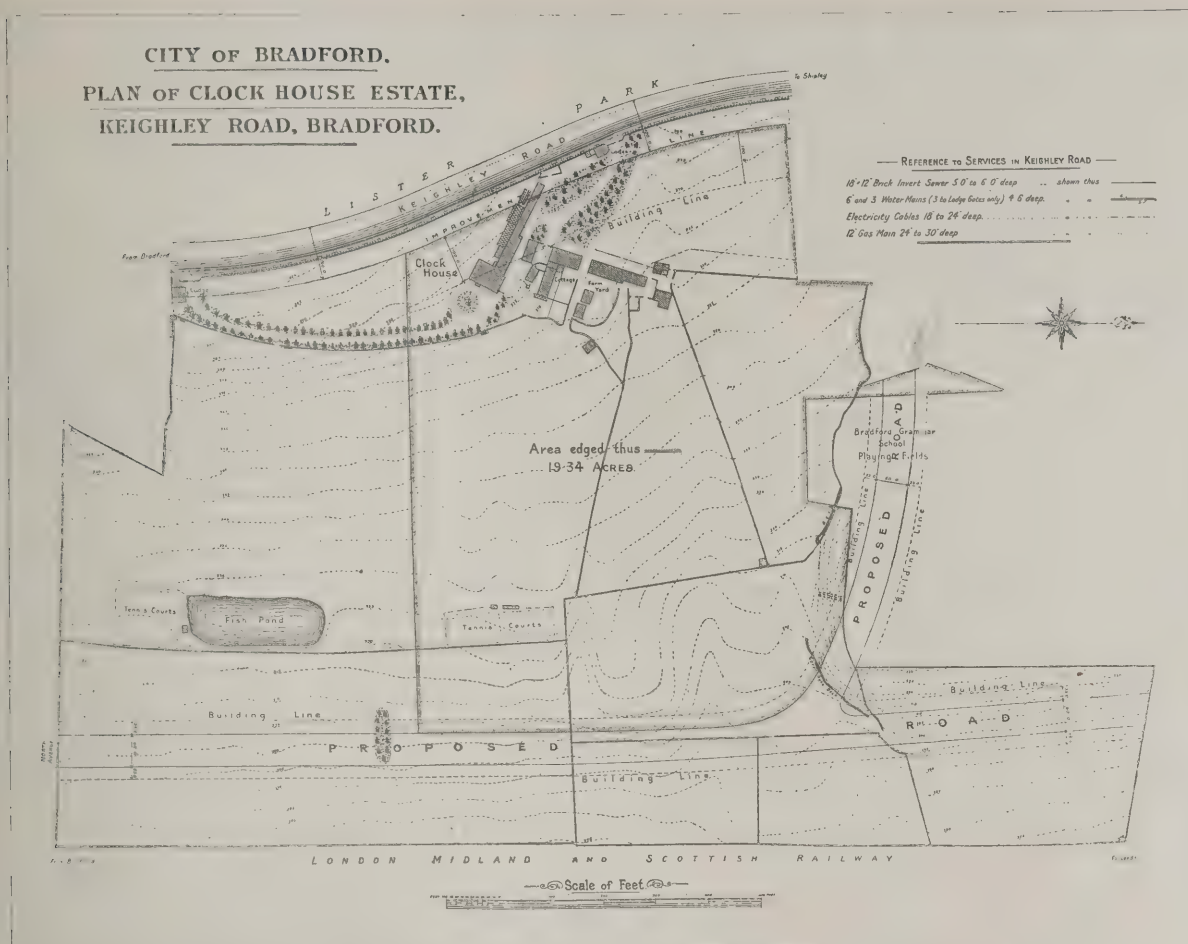

RELEGATED CANDIDATES.—It was decided that unless a candidate passes in at least two subjects in the Intermediate or Final Examination, he shall be required to take the whole of the examination at a subsequent sitting.

PROBATIONERS.—It was decided that in the regulation whereby after October 1, 1927, no one will be registered as a probationer unless that person has passed one of the recognised public examinations in the required subjects, the date December 31, 1928, be substituted for October 1, 1927, and that no further extension be made, as the Board of Architectural Education regard the School Leaving Certificate as constituting the minimum standard of general education which should be attained by a professional man.

The Architects' and Surveyors' Approved Society

The committee report that the membership during 1926 has again increased to the extent of 40 per cent. over that for 1925. In spite of considerably increased payments of benefits during the past few years, the benefit fund amounted to £12,556 11s. 10d., of which £5,169 8s. 9d. is invested in gilt-edged securities. To obtain the maximum benefits from National Health and Pensions Insurance, the committee confidently recommends employers and employed to conduct their insurance through the Architects' and Surveyors' Approved Society. The fact that the benefit fund now amounts to £12 10s. per member is, they state, itself not only a guarantee that that society can pay a scale of benefits comparing most favourably with those of larger and better-known societies or of the Post Office, but also that the provisions of the various Insurance Acts can be interpreted on a most liberal basis.

The new Gladstone Dock at Liverpool, covering 58 acres, is to be opened early next month.

BRADFORD GRAMMAR SCHOOL COMPETITION

As announced in a recent issue, the Governors of the Bradford Grammar School invite architects to submit designs in competition for the New Grammar School proposed to be erected on the Clockhouse site in Keighley Road, Bradford, Yorkshire. Mr. Arnold Mitchell, F.R.I.B.A., 21 Upper Mall, Hammersmith, W.6, is the assessor. Premiums of £300, £200 and £100 are offered respectively. Any questions which the competitors desire to ask must be addressed to W. Brear (from whom conditions and a site plan can be obtained), Secretary, Grammar School, Bradford, on or before March 31, 1927. The drawings must be accompanied by a concise typewritten description of the buildings explaining their construction, finish and the materials proposed to be used, and giving such information as cannot be clearly shown on the drawings. An estimate of the cost must also be sent, based on the cubic contents of the buildings measured from the top of the concrete foundations to half-way up the roofs, or 2 feet above the flats. The Governors contemplate an expenditure of £150,000, and if a competitor is of opinion that this sum is insufficient for the whole scheme he may specify what part or parts of his design must be omitted to bring the cost within the stipulated sum. The following drawings are required: Site plan (from Keighley Road back to the 340 contour line), cross sections of each block, three elevations, plan of each floor, drawings to be in outline—without tint or shading, walls on sections and on plans to be blacked in, lettering to be plain block letters, site plan to be the same scale as site plan supplied, other drawings to be to a scale of 16 feet to 1 inch; no perspective drawing may be submitted, no other drawings may be submitted.

The design should be simple and dignified. The buildings should be faced with stone throughout. It

is advisable that competitors should make themselves acquainted with the local conditions.

The School is to accommodate 1,000 boys mainly upon two floors, 730 boys in the upper school, and 270 in the lower. As far as is possible these schools should be separate and self-contained though not in detached blocks. They should have separate entrances, cloak rooms, lavatories, bicycle accommodation and covered shelters. Laboratories would solely be used by boys in the upper school. The art rooms, assembly hall, dining room and gymnasium should be available in common for both upper and lower schools. Cloak rooms should be heated. Coat lockers are not required.

Lower School.—Two class rooms seating 25, six class rooms seating 30, one class room seating 40, with cupboard accommodation for storage of library books. **Upper School.**—Six class rooms seating 25, eighteen class rooms seating 30, one class room seating 40 (it is desirable that two of these rooms seating 30 should be capable of being thrown together with sound-proof partition), museum (this item might be met by show-cases in a corridor), prefects room. **Science Rooms.**—Advanced chemical laboratory for 25 boys, advanced physical laboratory for 25 boys, chemical laboratory for 30 boys, physical laboratory for 30 boys, joint laboratory (chemical and physical) for 30 boys. The chemical and physical laboratories for 30 boys should have, in addition to their 30 working benches, space for the boys to assemble for class teaching round the master's desk. **Lecture Rooms.**—Lecture room to accommodate 100 boys (the lecture room should have ordinary seating with a stepped floor); physics lecture room to accommodate 30 boys; joint lecture room (chemical and physical) to accommodate 30 boys; preparation rooms and store rooms as necessary; two small rooms for masters; dark room; no separate

balance room is desired; small power house and workshop combined for the physics laboratory assistant. Administration.—Head master's room, cloak room and W.C.; waiting room; Governors' room (to seat 25), cloak room and W.C.; staff rooms, one large and one small, to accommodate a total of 45 masters, with cloak room and W.C.s; secretary's office (with place for safe); telephone box; stationery room; a small caretaker's cleaning room with hot and cold water should be provided on each floor; separate cottage for curator (two living rooms and three bedrooms) with bath-room and W.C.

Two covered five courts and a swimming bath are required—accessible by both upper and lower boys. It is most desirable that external approach to buildings be adequately paved and drained, securing dry and cleanly access in all cases.

The Assembly Hall.—The hall should accommodate 1,000 boys. Gymnasium.—The floor space 60 feet by 30 feet. Dining Room and Kitchen.—Dining room should seat 250. Library.—The library should have an area of 900 square feet. Art Rooms.—Two rooms, area of each about 1,020 square feet, with small store room. Class Rooms.—Provision should be made in three rooms for lantern exhibition, and the 40-place class rooms should have sinks and water laid on. Bicycle Accommodation.—Must be covered and separate for juniors and seniors to accommodate total of 250 bicycles. Manual Training and Metal Work Shop.—Two workshops to accommodate 30 boys each.

This is an exceptionally difficult site, with a steep slope from west to east, and competitors will be required to exercise all their ingenuity in arranging the plan of the school building so that the cost of excavation be reduced to a minimum. The site appears to call for a long range of buildings at as high a level as may prove convenient and having its principal frontage facing east. There is obviously an opportunity for a fine composition, dominated by the Assembly Hall, but not necessarily a symmetrical one, for the widely different sizes of the upper and lower schools provides an excuse for a lay-out characterised by a certain amount of informality, which the contours of the ground seem also to suggest. Fortunately the two schools, although to be separate and self-contained, are not to be in separate blocks. Thus it will be possible to design one large architectural formation expressing the essential unity of the institution. The conditions of the competition are drawn up in such a manner that the utmost freedom is left with regard to the respective floors on which the items of accommodation are to be provided. While this renders the task of design easier in some respects, it is likely that many of the competitors will wish for more specific guidance on this point, and will, of course, be at liberty to submit the usual list of questions. A difficult problem will be to determine the maximum area of ground to be occupied by the buildings, if the cost of foundations is not to prove excessive. On the other hand, laboratories, art rooms, manual training rooms and gymnasium are all the better for top-lights, and can with great convenience be placed on the first floor. The convention appears to be freely established that class rooms must be cross-ventilated between the outside wall and a corridor itself either open or having large windows on the side opposite the class-room wall. Competitors may with advantage take note of the assessor's report in the recent competition for a school at Perth, in which he condemned all the designs showing closed-in courtyards, even in the instances where only corridors overlooked the latter.

The roof of the Temple Church, London, is to be extensively repaired, having been affected, not by the death-watch beetle, but by damp and decay.

An Architectural and Town Planning Competition in Brussels

An important competition has been instituted by the Ministry of Public Works in Brussels for the lay-out of buildings in the neighbourhood of the Palais de Justice. Particulars and conditions appertaining to this competition can be obtained from "Monsieur le Conservateur du Palais de Justice, Brussels."

This competition is sponsored by the "Société Centrale d'Architecture de Belgique" and the "Société Belge des Urbanistes et Architectes Modernistes," and architects of all nationalities are invited to submit plans. The following data is supplied:—

(a) A general plan to 1-1250 scale of the environs of the Palais de Justice, showing all the streets between the Boulevard de Waterloo and the Rue Haute.

(b) A plan to the scale of 2 millimetres to the metre of the Rue des Quatre-Bras and the Place Poelaert, with the levels of roads and sections of principal buildings.

(c) Photographic views of the Palais de Justice.

All the historical and contemporary documents concerning the lay-out of the Place Poelaert and of the streets giving access to it can be consulted at the office of M. le Conservateur du Palais de Justice from 9-11 a.m. and 2 to 4 p.m. from March 1, 1927, to the date fixed for submitting the designs.

Competitors are required to submit:—

(a) A plan to the scale of 5 millimetres to the metre showing in detail which buildings should be preserved, modified or re-designed; and also indicating all the streets and open spaces.

(b) Elevations to the scale of $\frac{1}{2}$ centimetre to the metre of all the buildings proposed.

(c) Elevations to scale of 1 centimetre to the metre for 60 metres of frontage.

(d) A perspective covering a maximum area of 1 square metre, showing the exact relationship between the various buildings.

(e) Sections of roads, showing the provision for vehicular traffic.

(f) A concise explanatory report not exceeding ten pages of type-script.

The competition opens on March 15, 1927, and closes on June 15, 1927. The jury comprises ten members—two distinguished engineers, who are State officials, three architects, also State officials, one architect representing the City of Brussels, and two architects representing the "Société Centrale d'Architecture de Belgique," and one architect and one town-planner represents the Société Belge des Urbanistes et Architectes Modernistes, who will give their judgment on July 31, 1927, at the latest. No monetary prizes will be awarded, but the author of the design placed first will be required to make further detailed drawings, and while being employed in the execution of the design will be remunerated in accordance with the standard scale of fees adopted by the Federation des Sociétés d'Architectes et Belges and of the "Société Belge des Urbanistes et Architectes Modernistes."

A New India House

The project for the provision of an India House in London has received the approbation of the Standing Finance Committee of the Indian Legislative Assembly. A site has been selected on the Aldwych property of the London County Council, the High Commissioner obtaining an option pending a decision in India. It is understood that he is being advised architecturally by Sir Herbert Baker, one of the architects of New Delhi.

New Ways and Means

*The Editor will welcome early information of
New Plant, Materials and Fittings*

The "Edina" House Service Pump.
(The Chalmers-Edina Co.)

A House Service Pump for Long Distance Control

The electrically driven pumping unit which we illustrate on this page was originally designed for raising water to storage tanks on buildings where an efficient service was unobtainable through lack of pressure from the main pipe supply, but by reason of its compactness and accessibility the makers, Messrs. The Chalmers-Edina Co., of 39 Assembly Street, Leith, have now placed it on the market as a service pump of suitable proportions for country houses. The set is entirely self-contained, and can be arranged to work in conjunction with a float switch in the overhead supply tank. The consumption of power is reduced to a minimum by the eliminating of all possible friction, this being effected by mounting the spindles in heavy ball bearings which require the minimum of attention as regards lubrication. When conditions demand it, this plant can be fixed any distance from the house, starting and stopping being controlled from an ordinary tumbler switch placed in the house. The pump itself has a gunmetal barrel and valve-box with ground-in valves, and a large

copper air vessel. Standard sets are fitted with $\frac{1}{4}$ h.p. electric motors rated at 220/250 volts D.C., but where current of a lower voltage may be in use, suitable windings can be supplied. The overall height of the unit is 27 inches; its capacity is 300 gallons per hour against any head up to 100 ft., including suction up to 20 ft.

A New Concrete Mixer

A new portable concrete mixer of the "open drum" pattern, with a capacity of $3\frac{1}{2}$ cubic ft., making for an output of 22 cubic yards of mixed concrete per day, has just been placed on the market by Messrs. Goodwin, Barsby & Co., Ltd., of St. Margaret's Iron Works, Leicester, whose London office is at 54 Doughty Street, W.C.1. The drum of this machine is provided with a cast-iron base, and the upper portion, in which the vanes are fitted, is of steel plate. Power is provided by a $1\frac{1}{2}$ h.p. Lister petrol engine, which is totally enclosed in a lock-up steel housing, the drive being trans-

The "Goodwin" Open Drum Mixer.
(Goodwin, Barsby & Co.)

mitted through a totally enclosed steel roller chain and spur gearing. The complete machine is mounted on a steel underframe, fitted with wrought iron road wheels, lock and drawbar, the total weight being just under 12 cwt.

A New Radiator Valve

A new "Ideal" Concealed Valve has been introduced by Messrs. The National Radiator Co., Ltd., of Hull, and of 439-441 Oxford Street, London, W.1, for use on their "Classic" Radiators. The feature of this valve, which is illustrated, is a metallic bellows provided round the spindle to form a safeguard against leakage. The seating is of brass and fits against the bevelled edge of the top radiator nipple, one complete turn of the composition handle sufficing to open or close the valve. This type of valve, moreover, gives the advantage of a top feed to radiators having supply and return connections at the bottom, this being secured by assembling the first and second section of the radiator at the bottom with a solid malleable iron nipple, so that the water upon entering rises

The "Ideal" Concealed Radiator Valve.
(The National Radiator Co., Ltd.)

up the first section before passing through the radiator under control of the valve. It will also be noticed that this new valve fits snugly against the radiator, and is especially suitable for heating installations where neat appearance is a matter of importance.

A New Woodworking Machine

An improved machine for cutting single and double tenons and scribing the shoulders, and for trenching and cross-cutting to the full capacity of each size, has recently been placed on the market by Messrs. A. Ransome & Co., Ltd., of Newark-on-Trent, and of 63 Queen Victoria Street, London, E.C.4. In this machine the horizontal cutter spindles revolve in ball bearings in dustproof housings, the upper spindle having an independent horizontal adjustment for cutting tenons with unequal shoulders. The cutter blocks are arranged to carry the cutters so that these operate with a shearing cut, which is divided by having two pairs of cutters, one pair cutting half the length of tenon and the second pair the other half. A vertical scribing spindle can be fitted to either or both horizontal cutter carriages. These spindles have independent horizontal and vertical adjustments; they carry small square cutter blocks and are driven from the machine countershaft. Double tenons are cut with a drunken saw mounted on a vertical spindle; cross-cutting is done by an independent horizontal spindle which carries a 16-in. diameter saw. The machine is entirely self-contained except for the countershaft, which is separately fixed to avoid vibration. The countershaft, with fast and loose pulleys, runs at 950 R.P.M., 7 to 10 B.H.P. being required to drive it, according to the number of cutter spindles operating.

Heavy-Duty Tenoning Machine.

THE GESOLEI CAFÉ, DÜSSELDORF. E. L. WEHNER, Architect.

SOME MODERN ARCHITECTURE OF GERMANY

The Work of Eduard Lyonel Wehner

By HOWARD ROBERTSON, F.R.I.B.A., S.A.D.G.

There is no country with an architectural history of any importance which is not making some contribution towards the modern movement, and it is interesting to note to what a great extent the tendencies of the modern work are governed by the natural human impulse towards reactions.

Major changes in architectural style seem always to have come about through mass movements of reaction either in religious feeling or in intellectual development, and the nature of each new phase has depended very largely on the strength of the previous phase, the violence of the reaction being proportionately greater where the characteristics of the preceding epoch have been more marked.

As a general rule, these reactions would naturally be a gradual development, unless, as has sometimes happened in phases of history, some event of unusual import has retarded or speeded up the normal process. In the case of a cataclysm, such as the Black Death in the Middle Ages, or the World War, the effect on architecture is a temporary suspension of material activity; but while there is less actual work proceeding, it would appear as if mental processes of development were cumulative, for we find, when conditions have returned to normal, a very strong and rapid manifestation of new desires and impulses and the release of the pent-up creative energy.

This has been the case in Austria, Germany, and France, and also in Holland and Sweden, these two latter countries having had their building activities largely suspended in the latter years of the War.

In every country there have been evidences of what appears to be a new movement in the arts, including architecture. In reality this movement is merely a stage in a process of evolution, but it appears more marked since the forces behind it have been temporarily arrested and when liberated have shown their accumulated strength.

It may seem illogical that the process of development in architecture can be considered as continuing under circumstances which preclude any experiment in building. But while an event like the War prevents any practical opportunity of testing theories, it is a stimulus to the creation of thought and to the classification of aims.

The work of Erich Mendelsohn in Germany is an instance of a definite direction given to architectural thought by observation and meditation under the stress of war conditions; and there can be no doubt but that what one might call the "simplist" school, the architects who reject all but the most essential forms and details, has arisen as a kind of natural reaction against the shams and hypocrisies which afflict architecture and which in other directions contribute to the possibility of such disasters as a world war.

One has only to read the writings of men like Le Corbusier and Ozenfant in that interesting French publication *L'Esprit Nouveau* to realise that there is something much deeper behind the modern movement in architecture than a mere desire to be startling and original, though these are the motives which are generally attributed to any designers who have broken sharply with tradition. Quite apart from the logic and reason which lie behind the new expression, the demands of hygiene, of economy, of comfort, there is an urge to create a fresh atmosphere in architecture, something clean and bright and gay, dispensing with all the outworn symbols of character, and rejecting all the elements and details which are meaningless and useless. There is a desire, wholly praiseworthy, to seek out the essentials of form, and to stimulate creation as opposed to adaptation. The greater the genuine need for an infusion of new spirit into the architectural tradition of any country, the stronger has been the response to the demand. France, which has

been through a period of modern decadence, has the compensation of finding her architectural traditions revitalised by the work of a number of men who before the War had initiated what can fairly be called a modern movement. Holland, with the rich heritage of the Dutch Renaissance, a phase impossible of honest repetition under modern conditions, has seen a safeguard against debasement in a modern expressionism of form, an architecture really based on the exploitation to the full of the plastic possibilities of very simple elementary shapes; and America, whose architectural history has for many years been one of progress, has only just begun to suffer sufficiently from arrested development to explain the need for an infusion of the modern spirit. And, true to the law of action and reaction, a supply of this modern spirit has not been lacking, as is apparent from the trend of design in some of America's latest and most interesting buildings.

In Germany, where both the mediæval and the Renaissance styles have been pursued to a point where real development has ceased, a reconsideration of architectural aims long ago became an urgent necessity. The last hundred years of German architecture show a debasement all the more insidious on account of the luxuriance of its presentation. Mediæval recollections, and the gross form of classic which imparted to Berlin the flavour of a vulgarised Imperial Rome, have more in common with the art of stage setting than of really significant architectural design. Both of these types are, in addition, imbued with a kind of heavy and flaccid Romanticism which makes a popular appeal of the most undesirable type, making difficult the education of the public towards the appreciation of a finer architectural sentiment.

This spirit of pseudo-Romanticism, through its appeal of reminiscence and association, has an apparent hold on popular taste. But its claims to real esteem are so slight that it makes a feeble resistance to any architectural expression which offers the genuine satisfaction of logic and design knowledge applied to the problem of building. And it is for this

THE GESOLEI CAFÉ, DÜSSELDORF: DETAIL OF ENTRANCE. E. L. WEHNER, Architect.

reason that the German modern movement has spread so quickly and has found so many opportunities for self-expression.

It is strange that more mention has not been generally made of the Cologne Exhibition of 1914, which in architecture was perhaps more significant than the Paris Exhibition of 1925, since it contained the germ of all the tendencies and reactions which later there appeared. The interest of the work at Cologne was the liberation of design from accepted formulæ, and that same study of elementary form expressed in modern materials which characterised some of the best work at Paris. As showing a complete revulsion against a debased Romanticism, the Cologne Exhibition marked an important forward step.

Very similar in their main architectural ideals are the buildings erected at last year's Düsseldorf Exhibition of "Hygiene, Social Welfare, and Physical Culture," of which we are illustrating some examples by Eduard Lyonel Wehner, a German architect, whose work at the exhibition and elsewhere is very typical of the modern German effort towards truthfulness in general form and expressive interest of character.

Just prior to the Düsseldorf Exhibition Wehner had the opportunity of dealing a blow at pseudo-Romanticism in architecture through his work for the enlargement and alteration of an important Rhine bridge at Düsseldorf, where he seized on the widening of the roadway as a pretext for sweeping away some bridge gatehouses and ornamental pylons which were introducing an element of false and meretricious sentiment into a straightforward engineering design of great steel spans. The improvement effected in this bridge by *elimination* of architectural features was a very practical object lesson in the expression of essentials, and the satisfactory result has shown the public that, however tentative and unsatisfactory some of the modern work may be, it has behind it soundness of principle.

DETAIL OF THE "GERMAN RAFFEISENBANK" IN DÜSSELDORF. E. L. WEHNER, Architect.

DETAIL OF STAIRCASE IN A COUNTRY HOUSE IN
OBERHAUSEN. E. L. WEHNER, Architect.

Wehner's work at the Düsseldorf Exhibition has offered him his best opportunity in the gigantic sports section which has attracted especial attention through the fine treatment of the great hall for the aviation exhibits. Uninterrupted space and an even distribution of light, together with economy and simplicity of construction, were the principal requirements for the Aviation Hall, and they have been admirably met. The great wooden trusses, with their facing of rough boards painted in a scheme of yellows and browns, produce in their disposition a fine effect of rhythms and space, and their curvature is admirably considered. The system of high side lighting is equally worthy of praise, for by the arrangement of his windows between the deep haunches of the trusses, Wehner has recognised the principle so well understood in the larger rooms of Ostberg's Stockholm Town Hall, that the source of light itself should, if possible, be masked, while still remaining unobstructed. Lighting, both daylight and artificial, is one of the modern architect's most attractive problems, and in this Aviation Hall Wehner has carried out an exceedingly interesting and successful experiment which will prove a valuable guide to other designers faced with a similar problem.

The exterior of this Sports Hall, which covers an area of over 8,000 square yards, and which is flanked by two simply treated shopping arcades, is less significant in the expression of a purpose than is the great internal nave. It is the ever present difficulty of attempting to convey in the solids of architecture an impression of character without running to the extremes of either the simple notice board or a complicated symbolism. The main front is well composed—it has qualities of dignity without being too portentous. But it has perhaps missed an opportunity in not suggesting, by some other motive than the rather solemn arcade of pointed openings, something of the tense economy of structure and lightness of design which characterise the aircraft which it houses.

Part of the building scheme in the Düsseldorf Exhibition is to be permanently retained as a contribution to the town planning development of the city, and some of the buildings will remain up for

the period of a year. Amongst the latter is the interesting Gesolei restaurant by Wehner, which we illustrate, a building which very well expresses "the style of the age" in Germany as applied to buildings of this type. The design depends largely on colour and on effective illumination. The general plaster tones are orange, the pillars, cornice and tower are in light yellow, and the tower openings are glazed in bright-hued "Pastelglass" illuminated from within. The wide frieze and the soffit of the broad eaves overhang, and are flood-lit at night by red and white lights concealed in the projecting caps of the piers and pilasters.

The design is a little lacking in interest of detail and in minor elegancies of form, but it has a quality of vigour and line in keeping with its situation on a bank of the swift-flowing Rhine. The tower, interesting in itself, appears from some viewpoints to be lacking in height, and seems to feel the need of some form of base.

In much the same note as the restaurant is a newspaper stand by Wehner, a very practical and interesting treatment of the usual exhibition kiosk. The finish here is in red enamel.

Of more permanent interest than his exhibition buildings is Wehner's work for private clients, of which we illustrate two examples, the "German Raiffeisenbank" in Düsseldorf, and the staircase in a country house in Oberhausen. The bank interior is treated in colour, in tones of yellow, brown, grey-green, and gold. Its detail is sober and appropriate, and the general impression suggests a friendly urbanity rather than the imposing splendour of the usual American banking institution.

The staircase design is original and amusing; it, like the ceiling pattern, strikes a more assertive note than we are accustomed to in our own domestic work, but the bold treatment is successful.

Eduard Wehner was trained in Düsseldorf, and has practised there since 1906. He was also, for about three years, a teacher at the Academy of Art. His buildings reveal the architect who is modern by instinct rather than with deliberate intention; there is no trace of a merely modish originality or of a misplaced flippancy. The work bears the imprint of the trained and sensitive designer, and, whatever other criticism may be made, it is both purposeful and consistent.

Book Notices

Specification, for 1927. Edited by Frederick Chatterton, F.R.I.B.A. (The Architectural Press).

This, the 29th yearly issue of the "*Specification*," contains six special articles in the present edition. The titles of the articles are as follows: (1) "The Planning of Nursing Homes," by C. H. Biddulph-Pinchard, F.R.I.B.A.; (2) "The Design and Construction of Games Courts," by a Specialist; (3) "The Building Line in London and its Restrictions," by Gilbert H. Longrove, F.R.I.B.A.; (4) "Excavators," by William Harvey; (5) "Stainless Iron and Steel in Building Work," by a Specialist; (6) "The Treatment of Damp Walls," by Ernest G. Blake, M.R.S.I. *Heating and Ventilation*. By Louis J. Overton. (The Sutherland Publishing Co., Ltd.) 12s. net.

Mr. Overton's book on "Heating and Ventilation" deals with every aspect of the subject, from the earliest methods to accelerated circulation and oil-fired boilers. Incidentally a chapter is devoted to the preparation of heating engineers' quantities, whilst other chapters propound and solve very clearly many difficult problems which arise in the practice of heating engineering.

The Scientific Design of Masonry Arches. By T. Alexander and the late Dr. A. W. Thomson. (Macmillan & Co., Ltd.) 6s. net.

Manchester Grammar School

New Buildings at Fallowfield

The Manchester Grammar School, which was founded in 1515 by Hugh Oldham, then Bishop of Exeter—but a Lancashire man by birth—has, owing to its position in the heart of the city's activities, long been cramped for room and development, and particularly that vital necessity of modern public school life, ample playing fields near to the school buildings. The school has been growing rapidly since the early years of the present century, and it was considered advisable to acquire lands in the suburbs for use as playing fields. A site of about 40 acres was obtained at Fallowfield, between three and four miles to the south-east, upon which the new buildings will be erected from the designs of Dr. Percy Worthington in collaboration with Mr. Francis Jones. The school buildings, illustrated in this issue by a plan and a drawing by Mr. J. D. M. Harvey, have been treated in a most direct and satisfying manner, and the wise choice of brick as a material will ensure that it harmonises with the Ashburne Hall Hostel of the University of Manchester erected on an adjoining site two years ago.

The school buildings, which will have a main front to Old Hall Lane (a road leading at right angles into Manchester's principal exit to the south), will comprise (1) a main teaching block two storeys in height, built round a quadrangle, with (2) a one-storey extension to the right; (3) a great hall, 110 ft. by 45 ft., with gallery and organ, standing a little to the north of the teaching block and overlooking the Birchfields Park; (4) a science block connected by corridors with the main teaching block; and (5) a dining hall, 126 ft. by 40 ft. There will also be workshops, a gymnasium and a swimming-bath, all in separate buildings, and a block of administrative offices, approached past a statue of Hugh Oldham, the founder. It is estimated that 39 class-rooms will be provided for in the teaching block.

Ample grounds will surround the buildings, and it is calculated that there will be space for eight full-sized football grounds, as well as for cricket practice and matches, for lawn tennis and fives courts, and for a garden with broad walks. The trees on the estate will be as far as possible preserved.

A drive will lead through the playing fields to the main front, and the plans show an archway crossing this drive with a building for the Paton Memorial Library on one side and the school museum on the other.

Coming Events

The London Society.—Friday, March 18.—Mr. Montague Fordham, M.A., on "The Slums: Their Making and Unmaking." 18 John Street, Adelphi. 5 p.m.

Birmingham Architectural Association.—Friday, March 18.—Mr. W. H. D. Caple, F.R.I.B.A., on "The Annual Excursion to Laon."

The Royal Technical College Architectural Craftsmen's Society.—Friday, March 18.—Business Meeting. Mr. W. McCrae on "Architecture and Acoustics." 7.45 p.m. Glasgow.

The Yorkshire District (I.M.C.E.) and the Town Planning Institute (North of England Div.).—Friday, March 18.—Meeting at Manchester to discuss the Manchester Regional Report.

Institution of Municipal and County Engineers.—Friday, March 18.—Metropolitan District Meeting. 92 Victoria Street, Westminster. 6 p.m. (The South Midland District meeting will be held at Leighton

Buzzard, Beds., on Saturday, March 26; the North-Eastern District meeting at South Shields on Saturday, March 26; the Southern District meeting at Swindon on Wednesday, March 30; and the Eastern District meeting at Ipswich on Saturday, April 23).

Building Surveyors' Association.—Saturday, March 19.—General Quarterly Meeting. Cornmarket Hotel, 1 Old Ropery, Liverpool. 2.30 p.m.

The London Society.—Saturday, March 19.—Visit to the Geffrye Almshouses, Kingsland Road, Shoreditch, E.2. 3 p.m.

The Illuminating Engineering Society.—Monday, March 21.—Mr. Gilbert H. Jenkins, F.R.I.B.A., on "Garden Design." 34-36 Bedford Square, W.C.2. 7.30 p.m.

The Royal Society of Arts.—Monday, March 21.—Mr. G. I. Finch, M.B.E., on "Some Industrial Applications of Electrothermics." John Street, W.C.2. 8 p.m.

The Illuminating Engineering Society.—Tuesday, March 22.—A Discussion on Various Problems in Illumination and Practical Solutions. 15 Savoy Street, W.C.2. 6.30 p.m.

The Architecture Club.—Tuesday, March 22.—Complimentary Dinner to the Royal Commission on Cross-River Traffic in London. Savoy Hotel. 7.15 p.m.

The Surveyors' Institution (County Branch: Bath).—Tuesday, March 22.—Mr. G. R. Hutton, P.A.S.I., on "Building: Some Notes on Construction, Supervision and Practice." Bath.

Liverpool Architectural Society.—Wednesday, March 23.—Paper by Mr. Herbert J. Rowse, A.R.I.B.A.

The Geffrye Museum.—Thursday, March 24.—Mr. Walter C. Potter on "Veneers." Kingsland Road, Shoreditch, E.2. 7.30 p.m.

The Association of Architects' and Surveyors' Technical Assistants.—Thursday, March 24.—Smoking Concert (in aid of the Benevolent Fund) at Bedford Head Hotel, Strand, W.C. 7.30 p.m.

The Royal Academy of Arts.—Friday, March 25.—Sending-in day for Architectural Drawings. 8 a.m. till 10 p.m. Burlington Gardens Entrance.

Hampshire Architectural Association.—Friday, March 25.—Council Meeting. The Castle, Winchester.

Royal Institute of British Architects.—Monday, March 28.—Special and Business Meetings: Election of Royal Gold Medallist. 9 Conduit Street, W.1. 8 p.m.

The London Society.—Monday, March 28.—Visit to Southwark Cathedral. 3 p.m.

Manchester Building Trades' Exhibition.—March 29-April 9.—Particulars from Provincial Exhibitions, Ltd., City Hall, Manchester.

The Institution of Civil Engineers.—(Students' Meeting) Wednesday, March 30.—Mr. Vernon Francis Cornish, B.Sc., on "The London County Council Becontree Housing Estate." Great George Street, S.W.1. 6.30 p.m.

The South Wales Institute of Architects.—Exhibition of Photographs of Modern Buildings. The City Hall, Cardiff. May 9-14.

Morecambe Bathing Pool Competition

The following six architects have been selected to take part in this limited competition: Mr. Fred Harrison, 30 Willow Street, Accrington; Messrs. Easton & Robertson, 36 Bedford Square, London, W.C.1; Messrs. Boddy & Dempster, 19 Palace Street, Westminster, S.W.1; Messrs. A. W. S. & R. M. B. Cross, 45 New Bond Street, London, W.; Messrs. Thomas H. Mawson & Sons, High Street House, Lancaster; Messrs. Horth & Andrew, Custom House Buildings, Whitefriargate, Hull.

London Building Notes

AGAR STREET.—Sanction was given by the L.C.C. on March 9 to the proposed erection of new departmental stores in Agar Street, Chandos Street, and Bedford Street, W.C., to a height greater than that prescribed by the London Building Act, 1894. This building is the first section of a larger block designed by Messrs. Herbert O. Ellis & Clarke, 3-7 Old Queen Street, Westminster, S.W.1, for the Civil Service Supply Association, Ltd.

BARNES.—The Surrey E.C. have decided to proceed with the erection of the proposed new secondary school for boys on the housing estate at Castle-nau, Barnes, S.W. Plans have been prepared by Messrs. A. W. Jarvis, A.R.I.B.A., and F. A. Richards, F.R.I.B.A., 60 Tufton Street, Westminster, S.W.1.

BRENTFORD.—Plans have been approved for the erection of a new cottage hospital at Brentford, and funds to the extent of £6,000 are being raised. The architects are Messrs. Dodge & Reid, 120 High Street, Brentford.

BURNT OAK.—A range of shops and flats is to be erected on a site adjacent to Burnt Oak Station, on the L.C.C. housing estate. A contract for the first section of the buildings, consisting of 36 shops, has been placed with Messrs. Wilson, Lovatt & Co., Ltd., Clarence Street, Wolverhampton. The premises have been designed by Mr. W. Newsome Wright, F.S.I., Fire Station House, Bishopsgate, E.C.2.

CHISWICK.—The London and Home Counties Joint Electricity Authority have now deposited in Parliament a Bill for the obtaining of powers for the erection of a large generating station at Duke's Meadows, S.W. The scheme also includes the construction of a railway, a bridge, a water channel, and a dock. The consulting engineers to the authority are Messrs. Preece, Cardew & Rider, Queen Anne's Gate, Westminster, S.W.1.

CROYDON.—A modern bakery is to be erected adjacent to the central stores in London Road of the South Suburban Co-operative Society, Ltd. The building will be of three stories, and has been designed by Messrs. Bethall, Swannell & Durnford, 16a John Street, Adelphi, W.C.

CROYDON.—Messrs. T. Ebbutt & Sons, undertakers, 91 High Street, Croydon, are proposing to rebuild their premises in view of an early start by the Borough Council upon a road-widening scheme.

CROYDON.—Work is in progress upon the erection of a new Employment Exchange for Croydon for the Ministry of Labour. The builders are Messrs. C. H. Gibson, Ltd., Croydon. Plans have been prepared under the direction of Mr. R. J. Allison, F.R.I.B.A., Chief Architect to H.M. Office of Works, Storey's Gate, Westminster, S.W.1.

DENMARK HILL.—At the annual court of governors of King's College Hospital, Denmark Hill, S.W., it was stated by Dr. Ernest Baker that the whole of the wards were now occupied, and that the original plans anticipated the erection of three more

ward blocks on the land remaining. It is also proposed to build a private patients' block at a cost of £60,000.

FULHAM.—The Fulham B.G. have decided to enlarge their nurses' home at the Fulham Institution in Fulham Palace Road, W. Plans for the addition of an extra storey over the main building, and a residential wing accommodating a further 50-60 bedrooms, have been prepared by the Board's architects, Messrs. Saxon Snell & Phillips, 9 Bentinck Street, W.1.

HAMMERSMITH.—Operations have now been put in hand upon the Wormholt Estate, Hammersmith, W., where the L.C.C. propose to build a total of 660 houses at a cost of £433,000. The entire contract will be carried out by Messrs. Wilson, Lovatt & Co., Ltd., Clarence Street, Wolverhampton, under the direction of Mr. G. Topham Forrest, F.R.I.B.A.

HAMMERSMITH.—The Hammersmith B.C. propose to enlarge its Town Hall by the erection of an additional three-storey building. The accommodation suggested includes a new Council Chamber, Mayor's Parlour, with a large range of public offices, strong-rooms, etc. Plans have been prepared by Mr. R. Hampton C. Lucas, L.R.I.B.A.

HAMPSTEAD.—A new public utility trust, the United Women's Homes Association, Ltd., have decided to build a block of self-contained flats at the Hampstead Garden Suburb, to be exclusively occupied by professional women. The plans show a block of 50 flats. The builders are Messrs. Cropley Bros., Ltd., Church Road, Epsom, the architects being Messrs. Hendry & Schooling, 53 Doughty Street, W.C.

HARRINGAY.—A large racing course, with grand stands, refreshment rooms, stables, offices, etc., is to be built on a site in Green Lanes, Harringay, N.15, by the Greyhound Racing Association. It is proposed to provide accommodation for 40,000 people, the cost involved being estimated at £60,000. The consulting engineers are Messrs. J. G. Simpson & Co., 5 Victoria Street, Westminster, S.W.1.

HENDON.—A large building estate of over 17 acres in Page Road, Hendon, N.W., is to be developed for residential purposes, and negotiations are in progress. A lay-out plan has been approved. The agents are Messrs. Bellard & Co., 8 Waterloo Place, S.W.1.

HIGH HOLBORN.—The foundations have now been completed for the large block of offices and shops to be built on the site of Nos. 72-78, High Holborn. Work on the superstructure, which will be of six floors, will be carried out by Messrs. F. & H. F. Higgs, Ltd., Station Works, Hinton Road, Herne Hill, S.E. The plans have been prepared by Messrs. Robert Angell & Curtis, 133 Regent Street, W.1.

KENNINGTON OVAL.—A grant of £49,500 is to be made by the L.C.C. towards the estimated cost of £53,350 involved by the projected removal of the Archbishop Tenison's Grammar

School from its present location in Leicester Square, W.1, to a site at Kennington Oval, S.W. Plans for new buildings are now being completed by Mr. A. H. Ryan Tenison, F.R.I.B.A., 21 Great Peter Street, S.W.1.

KENTON.—It is proposed by the Bishop of Willesden to put in hand at an early date the erection of a temporary church for the new London Diocesan Home Mission district of Kenton, to be followed at a future date by a permanent edifice.

KINGSLAND ROAD.—The Queen on Friday, the 12th, laid the foundation-stone of the new nurses' home to be built at the Metropolitan Hospital in Kingsland Road, E. The new premises will cost £61,000 to erect. Among those present were Mr. Keith Young (the architect) and Mr. F. Pitcher (builder).

LAMBETH.—Plans will shortly be considered for the erection of additions to the out-patients' and casualty departments of Guy's Hospital, a gift of £50,000 having been given for reconstruction purposes by Sir Gilbert Wills. The architects to the Hospital are Messrs. Thompson & Walford, Leadenhall Buildings, Leadenhall Street, E.C.3.

MARYLEBONE ROAD.—An appeal for funds is being made towards the £40,000 required to rebuild the Western Ophthalmic Hospital in Marylebone Road, N.W. The new building has been designed by Messrs. Young & Hall, 17 Southampton Street, Strand, W.C., and will provide accommodation for 40 in-patients and a large number of out-patients.

MILL HILL.—A site in the Broadway at Mill Hill, N.W.7, has been secured for the erection of a block of business premises, consisting of 5 shops with suites of flats above. Plans have been prepared by Messrs. W. Morris & Son, surveyors, 57 Charing Cross, S.W.1.

PADDINGTON.—An appeal for £50,000 is being made by the Governors of St. Mary's Hospital at Paddington, W.2, who are proposing to considerably enlarge their buildings. It is planned to erect new wards for 46 beds and two operating theatres. The architect to the hospital is Mr. E. Stanley Hall, F.R.I.B.A.

WESTMINSTER.—A building in Grosvenor Road, S.W.1, has been acquired by the British Empire Academy as a site for the erection of a large art gallery. It is proposed, temporarily, to adapt the present buildings as galleries for the display of pictures, and plans have been prepared by Messrs. Rome & Birns, 15 Soho Square, W.1.

WIMBLEDON.—Negotiations have been completed for the purchase of Belmont Hall, S.W., originally the residence of the Duc de Orleans, and for its conversion into a Training College for Wesleyan Ministers. The residence itself will be adapted for instructional purposes, whilst two wings will be added to provide residential accommodation. A chapel will also be provided. The plans are now in course of preparation, the architect being Mr. George E. Withers, F.R.I.B.A., 50 Cannon Street, E.C.4.

The Week's Building News

The following abbreviations are used: U.D.C. for Urban District Council; T.C. for Town Council; R.D.C. for Rural District Council; E.C. for Education Committee; B.G. for Board of Guardians; P.C. for Parish Council; B.C. for Borough Council; M.H. for Ministry of Health; M.T. for Ministry of Transport; C.B. for County Borough; B.E. for Board of Education. Direct confirmation should be obtained before commitments, for which we cannot be responsible, are made.

AIRDRIE.—The T.C. of Airdrie have been authorised by the B.H. to accept offers for the erection of 36 houses at the Cairnhill site, consisting of 16 three-apartment flatted houses (four in a block), with sculleries and bathrooms, and 20 three-apartment semi-detached cottages (two in block), also with sculleries and bathrooms. The costs shown by the offers accepted work out at £425 2s. 1d. per house. The Council are at present negotiating for other sites where old houses are being demolished in order to erect new houses.

ALDWYCH.—A dance hall is to be erected in Aldwyck if the proposals of the London Theatres of Variety, Ltd., are carried out. The scheme includes the erection of two large blocks of premises near Bush House, comprising four theatres, a bank or insurance offices, restaurant, dance hall and other offices.

ARMAGH.—The R.D.C. have adopted a scheme for the erection of 66 cottages at a cost of £21,697.

ARNOLD.—The U.C. recently passed plans for the erection of 10 houses.

BARNLEY.—Barnley T.C. recently decided to instruct their Borough Surveyor to carry out a scheme for the erection of 200 houses by direct labour on a site to be decided at a later date.

BATH.—A communication was recently received from the M.H. intimating that formal consent had been given to the erection of 148 houses at Southdown, the agreed first instalment of the 280 to be provided there.

BATH.—At a recent meeting of the City Council it was stated that this year the Council is going to build 220 houses—almost as many as they had erected in the last eight years.

BEXHILL.—The Council has decided to prepare a town-planning scheme for an area within the borough. It is also co-operating with neighbouring authorities in a regional scheme.

BLACKPOOL.—A scheme for the erection of shop premises and houses is proposed by the Devonshire Estate Syndicate, and 240 houses and 12 shops are to be erected on the site. Building has been commenced on six of the shops and 26 of the houses. Mr. H. F. Keighley, F.R.I.B.A., 43 Topping Street, Blackpool, is the architect. The contract has been placed with Messrs. Herbert Hawksworth, Ltd., 220 Hornby Road, Blackpool.

BLACKPOOL.—Messrs. R. Fielding & Son, builders, etc., Stanhope Road, Blackpool, propose to erect 58 houses at Courtfield Avenue, Blackpool. The plans have been prepared by Messrs. Lumb & Walton, architects and surveyors, 19 Clifton Street, Blackpool.

BLACKPOOL.—The Lancashire Construction Co., Ltd., builders and contractors, Field Street Saw Mills, Blackpool, propose to erect 17 houses on Ellesmere Road.

BLACKPOOL.—The Layton Hall (Blackpool), Ltd., Collingwood Avenue,

Newton Drive, Blackpool, propose to erect 29 houses on Collingwood Avenue, Blackpool. The contract has been let to Messrs. H. H. Vickers & Sons, Whitegate Saw Mills, Blackpool.

BOLTON.—The Bolton Corporation have appointed Mr. Wynne Thomas, architect, Nelson Square, Bolton, for the Lostock open-air schools. The scheme provides for a building to meet modern requirements, and is estimated to cost £277,000. No contracts have yet been placed.

BURNLEY.—A proposal to build a new public hall at Burnley, on a site bordered by Bank Parade and Bridge Street, was mentioned recently at the adjourned annual licensing sessions at Burnley.

CANTERBURY.—The Kent C.C. are obtaining premises at Canterbury for a tuberculosis dispensary.

CAERPHILLY.—The U.D.C. have agreed to the erection of 20 houses at Abertridwr, 20 on the Grane site, Caerphilly, and 10 on the Pwllpant site.

CHESTERFIELD.—A new hotel is to be built at the junction of Newbold Road and Hawkesley Avenue. The hotel will cost £9,000 and will stand on the site of 1½ acres. It will have a billiard-room, a club-room, with a separate entrance, and at the rear of the site lock-up garages.

CLYDEBANK.—With a view to the extension of the existing municipal buildings the Clydebank T.C. have purchased adjoining premises at a cost of £9,000.

COULSDON.—The U.C. are to spend £2,956 on land for the erection of additional houses.

DARLINGTON.—The T.C. recently appointed a committee to consider and report upon the question of the erection of the new Town Hall and municipal buildings.

DURHAM.—The Corporation are to erect 114 houses of various types on the housing estate.

EDINBURGH.—The Dean of Guild Court recently passed plans for the erection of 24 suburban houses. The following were amongst the full warrants granted: Miss Mary Brown—three garages behind 16 Melville Street; Thomas Black Fowler—Sub-division of 15 Moray Place into two houses; John Hardie & Son—Six bungalows at Hailes Gardens, Colinton; Edwyn Oswald Inglis—Sub-division of 40 Moray Place into two houses; Mrs. Leonora E. Lindsay—Garage at Afton Terrace, Trinity; Alexander F. Maclean—Bungalow at Oxbangs Road, Fairmilehead; Murray Oliver—25 lock-up garages off Laverock Bank Avenue, Trinity; James Ross Stevenson—Garage at 23 Lauder Road; J. S. Murray Wilson—Bungalow at Comiston Road, Fairmilehead; James Miller—16 houses at Queensferry Road, Blackhall.

EDINBURGH.—The Housing and Town-planning Committee of the Edinburgh T.C. recently considered a report

by the City Chamberlain on the present position of the housing shortage in Edinburgh. The Committee urged to recommend the T.C. to proceed with the erection of 900 houses before the revision of the present Government subsidy. This subsidy is to be revised on October 1, 1928.

ELTHAM.—A new L.C.C. elementary school, costing £37,000, is to be built in Ealdham Square, Eltham.

FULHAM.—The B.C. Electricity Committee are to erect new showrooms for the department in Fulham Road, in accordance with plans prepared by Mr. H. M. De Colleville, at an estimated cost of £13,000.

GLASGOW.—The Rev. Dr. George Duncan, moderator, was granted permission to erect a church, etc., at the junction of Cumbernauld Road and Smithycroft Road.

GLASGOW.—The Housing Committee of Glasgow Corporation recently agreed to recommend the purchase of 26 acres of ground at High Carntyne, at £275 per acre, to be used for housing purposes.

GRINDLEFORD.—It is proposed to build a public hall at Grindleford, near Sheffield, at a cost of about £6,000. Plans have been prepared by Messrs. J. C. P. Toothill and J. Lancashire, of Sheffield, and a site already secured. Local stone, given by a resident, will be utilised in the building.

HEYSHAM.—The London Midland and Scottish Railway has decided to adopt Heysham as their principal port for North of Ireland traffic. It is understood that it is intended to extend the railway facilities by the enlargement of the harbour station, and to construct more storage buildings and accommodation for rolling stock.

HULL.—On behalf of Mr. J. P. Backwell, plans have been prepared by Mr. F. Runton Waller for new streets on the Trinity House estate, north of Anlaby Road, Hull. It is proposed to build 250 houses on the estate in the course of the next two years.

KELSO.—At a meeting of Kelso T.C. it was decided to build 16 houses—two blocks of 8 houses of two rooms, and a similar number of three-roomed. The rents would be £16 per annum for the two-roomed type, and £21 for the three-roomed houses.

KENNINGTON.—The L.C.C. Beaufoy Institute, Kennington, is to be enlarged, at an estimated cost of £11,960.

LEICESTER.—A Palais de Danse is in course of erection in Humberstone Gate, Leicester, which will contain a spring floor 95 ft. by 51 ft.
